Inupiaq -
Learning Sign Language

Inupiaq

L D Kaplan, University of Alaska, Fairbanks, AK, USA

Introduction and Dialectology

Inupiaq (Inupiatun, North Alaskan and Inupiatun, Northwest Alaska) is an Eskimo-Aleut language spoken in Alaska, part of the Inuit branch or Eastern group of Eskimo languages and distinct from the Yupik languages. Extending across the Arctic from Alaska through Canada to Greenland, Inuit varieties differ from each other in significant ways but nowhere is there found a sharp internal break that would constitute a language border, and so they are considered a dialect continuum (Figure 1). The Inuit groups of the Eastern Arctic are a diaspora that spread from Alaska, and the Bering Sea area is recognized as the homeland of the Eskimo-Aleut language family and people (*see* **Eskimo-Aleut**).

Inupiaq comprises two dialect groups, North Alaskan Inupiaq (NAI) and Seward Peninsula Inupiaq (SPI), each with two dialects. NAI includes the North Slope and the Malimiut dialects, with the former spoken along the Arctic coast and the latter found around Kotzebue Sound, along the Kobuk River and south at the head of Norton Sound. SPI includes the Qawiaraq dialect, found along the northern shore of Norton Sound, on the southeastern Seward Peninsula and at Teller, and the Bering Strait dialect is found along the shores of Bering Strait and on the offshore islands, King Island (now uninhabited), and Little Diomede. Dialects are distinguished primarily in terms of phonology, lexicon, and morphology and include a number of subdialects.

Phonology and Writing

The Alaskan Inupiaq writing system was developed by Roy Ahmaogak, a Barrow Inupiaq minister, and linguist Eugene Nida in 1946 and has undergone revisions since. Current orthographic symbols are given below with equivalent phonetic symbols in parentheses where the two differ. The entire palatal series is absent in SPI, *z* is present only in the Bering Strait dialect, and *e* has limited occurrence, found in SPI only, particularly on Little Diomede Island.

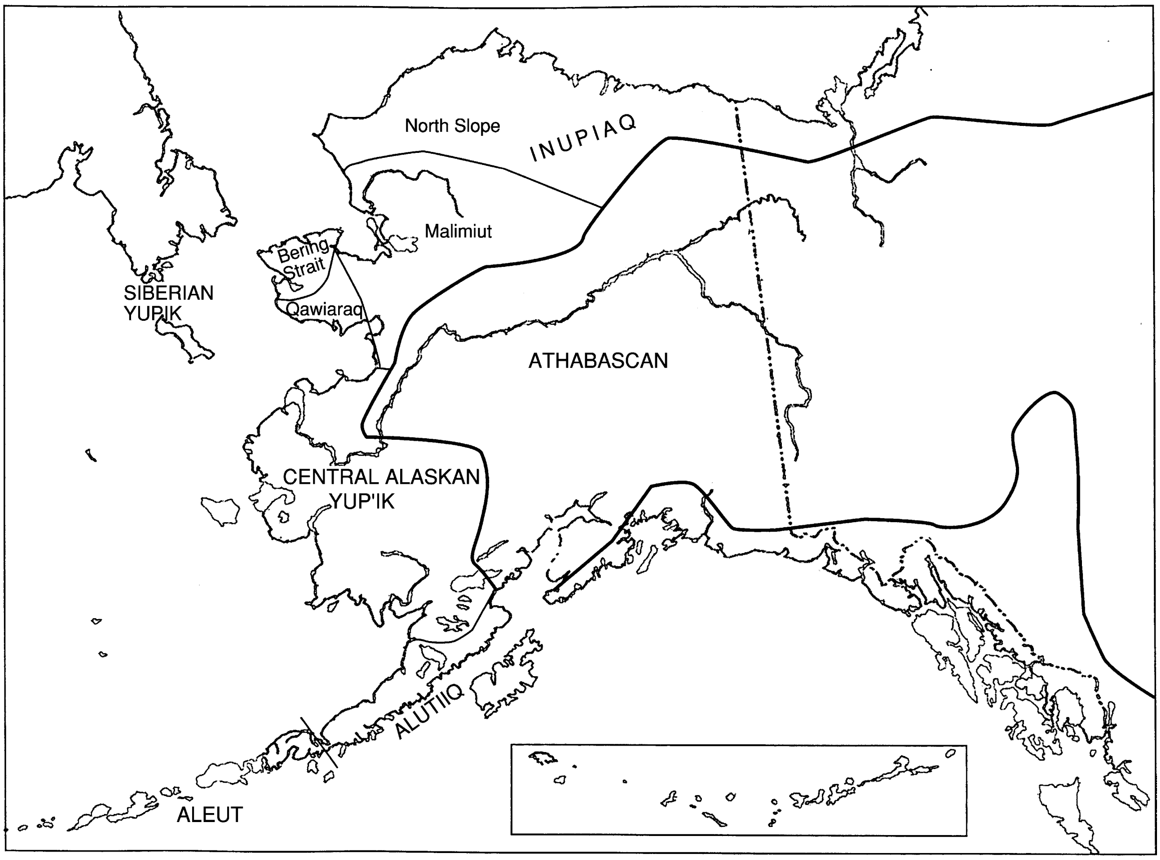

Figure 1 Eskimo-Aleut languages of Alaska.

Consonants:

p	t	ch(č)	k	q	‘(ʔ)
	ł(ɬ̥)	ł̣(ɭ̥)	ḷ(lʲ), y	g (ɣ)	ġ(ʀ)
m	n	ñ	ŋ		

Vowels and diphthongs:

i	e(ɨ)	u
		a

Consonants and vowels can be long and are then written double. Any two vowels with the exception of *e* may be paired: *ai ia ua au iu ui*. In most of Malimiut, certain diphthong pairs have coalesced and are pronounced identically: *ia* and *ai* are pronounced [e:], *au* and *ua* are pronounced [o:], and *iu* is pronounced like *ii* as [i:]. A major phonological phenomenon in Inuit languages is consonant assimilation, which increases in magnitude as one travels east (*see* **West Greenlandic**). Alaskan Inupiaq has differentiated clusters, although the North Slope dialect has assimilation by manner of articulation. Palatalization of alveolar consonants is notable in NAI, with palatalization of some velars found in much of Malimiut. A major distinguishing feature of the Inuit branch is the simplification of the Proto-Eskimo four-vowel system by the merger of the central vowel ɨ, principally with i. Reflexes of historical *i* trigger progressive palatalization of alveolars and assibilation of prevocalic *t* in NAI: NAI *iñuk* ‘person’ but SPI *inuk* and NAI *isiq-* ‘enter’ but SPI *itiq-*. Reflexes of the fourth vowel ɨ are typically [*i*] but may undergo deletion or alternation with other vowels.

Morphology and Syntax

Inupiaq is a highly polysynthetic language, and suffixation creates very long words, so that a word is often equivalent to an entire English sentence. Words are typically constructed of a noun or verb stem, one or more derivational suffixes, and an inflectional ending, and may be singular, dual, or plural in number. Examples are from the North Slope dialect:

(1) atuġ-nia-ŋit-chuk
sing-FUT-NEG-3du/INTRANS
‘they (two) will not sing’

Verbs may be intransitive or transitive, and transitive verb endings mark number and person of both subject and object.

(2) tautuk-kaat
see-3plSUBJ/3singOBJ
‘they see him/her/it’

The verb ending here expresses the subject and direct object, and pronouns are unnecessary, although they can be added in, as can nouns. Pronouns express person and number but not gender, which is expressed only by nouns. There are no articles.

(3) aŋutit aġnaq tautuk-kaat
men.pl woman see-3plSUBJ/3singOBJ
‘the men see the woman’

Word order is Subject-Object-Verb, although the complex inflectional system makes free word order possible. Through the influence of English, many speakers now prefer SVO order.

Lexicon and Ethnonyms

Lexical borrowing is primarily from Russian and English. Although the Russians never had a permanent presence in Inupiaq Alaska, the dozen or so Russian borrowings found in Inupiaq were probably introduced through trade with mainland Yupiks to the south and are found principally in SPI and Malimiut. Early English borrowings were introduced beginning in the late 19th century through contact with traders and whalers and were well integrated phonologically (e.g., *palauvak* ‘flour’). Modern-day bilingualism often gives rise to use of English words in Inupiaq speech, but these occurrences cannot be considered true borrowings.

Besides indicating the name of the language, ‘Inupiaq’ can also be used in English either as an adjective (e.g., the Inupiaq language) or a singular noun for a person (e.g., an Inupiaq from Barrow). The plural ‘Inupiat’ also is used for people (the Inupiat people, the North Slope Inupiat). With consonant palatalization, NAI uses the spellings ‘Iñupiaq’ and ‘Iñupiat,’ whereas SPI lacks palatalization and uses ‘Inupiaq’ and ‘Inupiat.’ Alaskans also use ‘Eskimo,’ although this term is disfavored in Canada.

Population and Viability

There are some 13 500 Inupiat in Alaska, about 3000 of whom speak the Native language. Inupiat are now bilingual or speak only English. Most speakers are in their late forties or older, and in some areas the youngest Inupiaq speakers are in their sixties or even seventies. The language shift to English is brought about by a number of factors: government, education, and media are largely in English (although Inupiaq is often heard on the radio); monolingual English speakers have lived among the Inupiat for decades; and airplanes have made travel outside the area easy. In addition, past Inupiaq language use was discouraged and often punished by teachers and school officials. In 1998, a majority voted to make English Alaska’s official language, sending a negative message in the view of Native language supporters.

The continued use of Inupiaq as a spoken language is threatened, and efforts at revitalization consist largely of school language classes. Language immersion programs exist in elementary schools in Kotzebue and Barrow, from which it is hoped that new generations of Inupiaq speakers will emerge.

Invented Language in Literature

P Stockwell, University of Nottingham, Nottingham, UK

Invented Language and Literary Worlds

All creative language, articulated in literary texts, is invented language, of course. However, all creative fiction depends on a greater or lesser degree of difference between our actual world and the imagined world of the text. Even a highly realist and naturalistic narrative, even a documentary faction or even a historical reconstruction are all likely to depart in small ways from the hard reality, and the form of expression used to articulate the divergent world will need to be different (and invented) from the language that is **really** real. As soon as a proper name for a character ('Snoopy,' 'Hamlet,' 'Heathcliff') is used, this invention serves to mark the divergence of worlds from that of the reader. Even words with apparently stable referents are used inventively in literary fiction: Dicken's 'London' is not our London; Philip Pullman's different 'Oxfords' are explicitly not our Oxford; even Wilfred Owen's Great War trenches are his literary projection of that landscape, rather than the landscape itself.

Furthermore, literary authors tend to express themselves in ways that are commonly regarded as 'poetic' or 'expressive.' This stylistic creativity can be manifest as metaphorical compounds (the Old English 'mere-stape' – 'sea-stepper' for a ship), or as lexical blends (e.g. cummings's 'manunkind'), or as grammatical disjunction (Robert Heinlein's 'the door dilated'), and so on. In most literature, though, these examples of departures from everyday language are minimal and serve only to mark out a local effect. They are usually one-off creations rather than being part of a thoroughly worked-out and systematic linguistic structure.

In this article, more radical linguistic inventiveness will be discussed, ranging from the creation of sets of new words that have a strong iconic value, to the creation of fully-fledged invented language systems. The functions of such creative artifacts will also be discussed, but it is worth pointing out at the beginning that the primary function of new language in literary fiction is to delineate the distance and connections between the reader's world and the world imagined in the text. Whether the invented language is for local ornamental color or seems intended for a central thematic purpose, imaginary lexis, grammar, and pragmatic patterns play an important role in establishing the readerly perception of escapism or political comment. Delineating the difference between the textual world and the reader's world is the first step in determining the significance of the work, in making identifications for empathy or satire, in being able to generalize the specifics of the storyworld onto principles for the reader's world.

This article begins with the smallest scale of linguistic inventiveness, in new words and new uses for existing words, before going on to consider higher level discourse creativity, and then full invented language systems. In setting out this scale, however, it is important to realize that a few well-placed new words can have as significant an effect as thoroughly imagined rich linguistic innovation. Therefore, this article will consider the artistic function of inventiveness separately. The article ends with a consideration of

The continued use of Inupiaq as a spoken language is threatened, and efforts at revitalization consist largely of school language classes. Language immersion programs exist in elementary schools in Kotzebue and Barrow, from which it is hoped that new generations of Inupiaq speakers will emerge.

Invented Language and Literary Worlds

All creative language, articulated in literary texts, is invented language, of course. However, all creative fiction depends on a greater or lesser degree of difference between our actual world and the imagined world of the text. Even a highly realist and naturalistic narrative, even a documentary faction or even a historical reconstruction are all likely to depart in small ways from the hard reality, and the form of expression used to articulate the divergent world will need to be different (and invented) from the language that is **really** real. As soon as a proper name for a character ('Snoopy,' 'Hamlet,' 'Heathcliff') is used, this invention serves to mark the divergence of worlds from that of the reader. Even words with apparently stable referents are used inventively in literary fiction: Dicken's 'London' is not our London; Philip Pullman's different 'Oxfords' are explicitly not our Oxford; even Wilfred Owen's Great War trenches are his literary projection of that landscape, rather than the landscape itself.

Furthermore, literary authors tend to express themselves in ways that are commonly regarded as 'poetic' or 'expressive.' This stylistic creativity can be manifest as metaphorical compounds (the Old English 'mere-stape' – 'sea-stepper' for a ship), or as lexical blends (e.g. cummings's 'manunkind'), or as grammatical disjunction (Robert Heinlein's 'the door dilated'), and so on. In most literature, though, these examples of departures from everyday language are minimal and serve only to mark out a local effect. They are usually one-off creations rather than being part of a thoroughly worked-out and systematic linguistic structure.

In this article, more radical linguistic inventiveness will be discussed, ranging from the creation of sets of new words that have a strong iconic value, to the creation of fully-fledged invented language systems. The functions of such creative artifacts will also be discussed, but it is worth pointing out at the beginning that the primary function of new language in literary fiction is to delineate the distance and connections between the reader's world and the world imagined in the text. Whether the invented language is for local ornamental color or seems intended for a central thematic purpose, imaginary lexis, grammar, and pragmatic patterns play an important role in establishing the readerly perception of escapism or political comment. Delineating the difference between the textual world and the reader's world is the first step in determining the significance of the work, in making identifications for empathy or satire, in being able to generalize the specifics of the storyworld onto principles for the reader's world.

This article begins with the smallest scale of linguistic inventiveness, in new words and new uses for existing words, before going on to consider higher level discourse creativity, and then full invented language systems. In setting out this scale, however, it is important to realize that a few well-placed new words can have as significant an effect as thoroughly imagined rich linguistic innovation. Therefore, this article will consider the artistic function of inventiveness separately. The article ends with a consideration of

the linguistic assumptions that seem to underlie these linguistic experiments. Since most examples of invented language come from the genres of science fiction and fantasy, the way that sf authors have imagined the science of linguistics is relevant to the discussion.

Neologism and Neosemy

New words ('neologisms') are a particular feature of science fiction (sf) and fantasy literature, where they have also been termed 'lexoids' (Mary Ellen Ryder, personal communication). Sf filled its early adventure stories with 'ray-guns,' 'ion-drives,' and 'teleporters,' and featured 'warp-speed' 'starships,' 'flying saucers,' and 'cyborgs.' There are clearly several types of word-formation at work here, drawing on all of the available resources of lexical generation in English. The following typology of neologisms is drawn from Stockwell (2000: 115–138).

Perhaps the most common form (unsurprisingly for a Germanic-based language like English) is compounding. Here, root words can be placed together as a single word lexical blend ('teleport,' 'holodeck,' 'cyberspace'). The most common source for such compounds draws on noun-combinations (N+N), as in 'wormhole' and 'starship' and hyphenated forms, such as 'ion-gun' and 'rim-world.' Because of the commonality of the source lexis here, it is fairly easy to work out a meaning for such neologisms, especially as they are always used in a disambiguating narrative context. N+V forms ('warp-drive,' 'terraform') also occur, and even Adj+V ('Newspeak') and V+Adj ('spindizzy'). Single-word neologisms such as these are typical of technologically-based science fiction, where a new invention or technical phenomenon requires an invented and brief label.

Compounding can also take the form of multi-word lexical items, such as 'flying saucer,' 'dilithium crystal,' 'tractor beam,' 'force field,' and many others. These, too, are very common in science fiction as they carry the flavor of a technical specification as well as often drawing on a scientific register. A less common form of phrasal circumlocution is also found, where the sense of 'newness' is diminished because the source elements are easily recognized. Examples such as 'sense-of-we-feeling,' 'Bug Eyed Monster,' or 'cultural engineering' retain a sense of a familiar phenomenon modified in the imagined world. All of these examples are fairly easy to understand.

Neologisms can also be created by borrowing. In this case, the borrowing can be from either terrestrial or imagined alien languages – though of course often the imagined alien language bears uncanny resemblance to root morphemes in terrestrial languages. In early sf, words were often borrowed from languages perceived by the British or American writers to be exotic. The proto-science fictional *Historie of the man in the moone* (1634) by Bishop Francis Godwin has the moon people speaking 'Lunarian,' based on his rather sketchy understanding of how Chinese sounded.

Alien borrowing (the 'Daleks' from *Dr Who,* or the 'Wookies' from *Star Wars*) can always be imagined as having terrestrial influences, of course. By far the most common source languages for neologistic borrowing are Greek and Latin, because of their use in much technical terminology and perhaps also because the decline in classical education over the last century has rendered the etymology more obscure and exotic. 'Sol,' 'Luna,' and 'Terra' have become common names for our local star system. 'Android,' 'cybernetics,' and 'cryogenics' all have Greek origins.

Straightforward original creation is rare, since the etymological origins of neologisms can usually be perceived. Usually only proper names show real creation, and these are then turned into full neologisms by grammatical derivation: 'Odonism,' 'Naderites,' 'Morlocks.' Such derivation also leads to 'back-formation,' where analogous forms are created: 'white holes,' 'corpsicle,' and 'astrogation.' The last two of these also illustrate longer coinages being abbreviated – it is common to find such shortened back-formations breaking the usual morphological boundaries: 'droid' is a broken form of 'android'; and the malicious race of 'Borg' are broken down from 'cyborgs,' which is itself an abbreviated and blended version of 'cybernetic organism,' which in turn consists of two words drawn from Greek.

Shortened forms like these, together with abbreviations, are another means of creating neologisms. 'Fax' (from 'facsimile'), 'bionics' (from 'biological electronics'), and 'cyborg' are all shortened forms that have become perceived as lexical items in their own right. Acronyms formed from the initial letters of phrases have also become lexicalized, and pronounced either 'atomically' in their separate elements ('UFO,' 'ESP,' 'ET') or 'molecularly' as a phonetic sequence (as in 'ufologist,' one who investigates unidentified flying objects; and 'esper' who has the power of extra-sensory perception; and the research organization 'SETI,' searching for extraterrestrial intelligence).

Of course, all the usual morphological inflections of English (such as the 's'-plural, the 'ing'-participle, the 'ed'-past suffix, and so on) further extend most of these neologisms. It is rare, however, with single neologisms to find inflectional creativity in literature. There is no parallel of the historical shift in

English from the third-person verb suffix '-eth' to '-s' ('maketh' to 'makes'), for example. Where there is innovation in grammatical particles, these tend to form part of a fully-fledged imagined linguistic system, rather than simply being associated with isolated neologisms.

Aside from neologisms proper, literary fiction tends to rely on 'neosemy' (a term coined in Stockwell, 2000), in the sense of a new meaning developed for an existing word. The neologism 'utopia' for example (from Thomas More's 1516 work (1910)) was coined as a proper name for his idealized island but has since been extended to refer to any idealized state, and inflected into 'utopian,' and back-formed into 'dystopian' and 'heterotopian.' A 'flying saucer' and a 'black hole,' strictly speaking, should be regarded as neosemes rather than neologisms. Neosemes have the advantage in literary fiction of making the imagined world seem close and more nearly extrapolated from the reader's familiar world. Neologisms, by contrast, can seem relatively disjunctive and alien.

Dialectal Extrapolation

More extensive than neologistic innovation but falling short of a full invented language, dialectal invention is a common compromise in literary fiction. Imagining the appropriate register or dialect that applies in the projected world allows the texture of difference to be established while not making undue demands on the reader to engage in detailed decoding. Sometimes, the dialectal projection is simply a product of a high density of neologisms and neosemes, drawn from source lexis that is reasonably easy to recognize. The futuristic dialect of William Gibson's *Sprawl* series of novels works like this (in fact, it was developed largely from 1970s Canadian biker slang):

> Molly was snoring on the temperfoam. A transparent cast ran from her knee to a few millimeters below her crotch, the skin beneath the rigid micropore mottled with bruises, the black shading into ugly yellow. Eight derms, each a different size and colour, ran in a neat line down her left wrist. An Akai transdermal unit lay beside her, its fine red leads connected to input trodes under the cast.
>
> He turned on the tensor beside the Hosaka. The crisp circle of light fell directly on the Flatline's construct. He slotted some ice, connected the construct, and jacked in. (Gibson, 1984: 98–99)

This passage, from the novel *Neuromancer* (itself a punning lexical blend neologism), displays neologisms that are easy to decode in isolation ('micropore'), in context ('snoring on the temperfoam'), and with a little etymological knowledge ('derm'). There are abbreviations that would be familiar to sf readers ('trodes' from 'electrodes'), as well as some neosemic usage: 'ice' as access to cyberspace, 'construct' as a noun for a software program, and 'jacked' applied to a human body rather than a machine's cable.

Similarly, Jeff Noon's 1993 novel *Vurt* draws on the street-slang of early 1990s Manchester, with some neologistic blends:

> Shadowcop! Broadcasting from the store wall, working his mechanisms; flickering lights in smoke. And then a flash of orange; an inpho beam shining out from the shadowcop's eyes. It caught Mandy in its flare-path, gathering knowledge. She ducked down from the beam, banging, hard-core, on the van doors. (Noon, 1993: 7)

Here the new phenomena are explained by the context, and rather than a clumsy definition being supplied, information is presented appositionally ('gathering knowledge') that is consistent with the point of view of the narrator. Both of these examples of dialectal extrapolation serve not only to gesture towards the alternate world, but also serve as part of the characterization in the texts. It is noticeable that literary fictions that feature dialectal innovation tend to be strongly focalized through a participating character: the narrative is thus their dialect, and the invented language takes the reader quickly into the conscious world of the novel.

Such dialectal invention is fairly minimal, of course, and some writers have developed the principle of dialectal extrapolation to underline the alternativity of their imagined worlds. Anthony Burgess, in his 1962 novel *A clockwork orange*, creates a dialectal slang for his violent gang-characters Alex and his 'droogs' (friends). Like many lexical items in the novel, this word derives from transliterated or anglicized Russian, along with 'baboochka' (old woman), 'bezoomny' (mad), 'bitva' (battle), 'gulliver' (head), 'horrorshow' (good), 'koshka' (cat), 'krovvy' (blood), 'malchick' (boy), 'skazzed' (said), 'voloss' (hair), and many others. The slang is called 'Nadsat,' the suffix equivalent to 'teen' at the end of the Russian words for the numbers 11 to 19. Nadsat also includes some Cockney-derived words and other inventions: 'viddy' (see), 'pretty polly' (money), 'platties' (clothes), and so on.

Nadsat serves to increase the reader's involvement with the focalizer, Alex, but replacing many of the words also allows scenes of 'ultra-violence' and rape to be portrayed with an immediacy that the reader might otherwise recoil from more instantly. In this way, the novel pitches the reader into Alex's mind

more effectively than if the narrative had been written entirely in Standard English.

The dialectal style serves a thematic purpose in the novel, rather than being merely ornamental or part of the background enrichment of the imagined world. Similarly, Russell Hoban's *Riddley Walker* (1980) presents an even more thoroughly realized dialectal extrapolation to symbolize the postapocalyptic fall of civilization, as seen through the eyes of the eponymous protagonist:

> Stoans want to be lissent to. Them big brown stoans in the formers feal they want to stan up and talk like men. Some times youwl see them lying on the groun with ther humps and hollers theywl say to you, Sit a wyl and res easy why dont you. Then when youre sitting on them theywl talk and theywl tel if you lissen. Theywl tel whats in them but you wont hear nothing what theyre saying without you go as fas as the stoan. You myt think a stoan is slow thats becaws you wont see it moving. (Hoban, 1980: 158)

Here, the written language of the future is imagined as a return to spoken vernacular forms with grammatical patterns reminiscent of existing rural nonstandard southern British English (the demonstrative 'them,' negative concord 'wont hear nothing,' relativizer 'what theyre saying'). The effect is to convey a simple-minded consciousness through which the reader must reconstruct the historical catastrophe that has befallen the country. The extrapolation relies on a set of assumptions about language change, of course, and an identification of spoken dialect with simplicity and social regression. Such extrapolation is artistically successful even if it is sociolinguistically dubious.

Hoban's style requires a great deal of effort on the part of the reader, with a corresponding risk that the reader might consider the task too onerous. The tactic has been pushed to its extreme by Brian Aldiss, in his psychedelic novel *Barefoot in the head* (1969). Here, he imagines a Europe bombed by psychotropic drugs that gradually disorientate the main character, Charteris. As the novel progresses, the lexicogrammatical patterning gradually comes to mirror Charteris's hallucinogenic perception:

> In the square they milled and sledded letting their origins down with mood music thrombic. The body hair buttressed and limbs rebuddied. Metamorphin slipper waker-slip. What they heard they herded and sluice-jiuces ran underfoot. As he luted their animinds. Ages went down into oceanic undertow. Civilians poured in and the old grey and biscuit buildings titaniced down into a glacial cobblesea. Inunvation of hands, plattening feet of limbic brand. Churning flowermotion with eddying scuffles sob-streperous among the one-backed beats. (Aldiss, 1969: 210)

More than 200 pages of this prose are incredibly difficult to read, but the effect can be rewarding if a great deal of attentive effort is expended. The transformations rely largely on lexical blending and collocational clashes, but for the most part the language is still recognizably derived from English. However, further linguistic experimentation has moved beyond existing natural languages altogether, an area that this article will consider in the next section.

Neographies

Inventing new languages is not simply the preserve of literary fiction. The Internet features many hundreds of 'neographies' that have been constructed either as part of literary or cinematic worlds, as extensions of such languages as imagined by fans of the originals, as experiments for teaching aspects of linguistics, or simply as the hobby of numerous people who enjoy inventing new principled artificial language systems. (Enter 'conlang' as an Internet search term to find most of these). By contrast with natural languages, artificial or constructed languages have no real native speakers – though some, like Ludovic Zamenhoff and Clara Zilbernik's Esperanto and its predecessor Johann Schleyer's Volapük, aspire to be used as genuine international languages.

Planned languages or constructed languages ('conlangs') are regarded by their enthusiasts as falling into three categories. Firstly, auxiliary languages ('auxlangs') are those like Esperanto or stripped down technical languages like Basic English, Business English, or Air Traffic Control English. Secondly, languages developed for artistic purposes ('artlangs') encompass invented languages that appear in literary works, as well as invented languages that appear in their own supporting worlds, and invented languages existing only for their own sake. The last two types are particularly prevalent as pastimes posted on the Internet. Thirdly, logical languages ('loglangs') are those devised usually by linguists, philosophers, or cultural critics as a means of demonstrating or teaching some point of principle in linguistics or philosophy – though most computer program languages would also count as loglangs.

For example, from 1955 the sociologist and science fiction writer James Cooke Brown invented a loglang called 'Loglan,' created to test out the Sapir-Whorf hypothesis in linguistics (which, briefly, draws a strong connection between linguistic structure and the patterns of thought that are then determined and constrained by language). The aim was to be as regular, principled, fixed, and stable as possible, since failures in these features in natural languages, it was argued, were what led to ambiguity and logical

lapses. If the strong form of the Sapir-Whorf hypothesis were true, then the speaker of Loglan should be a more logical thinker than the speaker of a natural language. The Logical Language Group released a public-domain version of the language as Lojban in 1987. Loglan and Lojban are based on predicate logic, with predicate functions (roughly, verbs) and participants (roughly, nouns); there are no adjectives or adverbs. Lojban has a greater vocabulary, with the aim of becoming a widely-used expressive language.

The science fiction writer Robert Heinlein was attracted to logical languages such as Loglan (and in fact refers directly to it in his 1966 novel *The moon is a harsh mistress*). In his 1949 novella, 'Gulf,' he also imagines a language called 'Speedtalk,' in which whole basic English words are represented by single syllables or phonemes. This brevity cuts down on the length of utterances required to set out a proposition and allows faster communication of complex ideas. In the story, the language develops superintelligence. Heinlein does not give extended examples of Speedtalk, of course; his artistic purpose is satisfied merely by gesturing towards the existence of the language rather than by realizing it fully. Loglan, by contrast, aims at full transparency and manifestness. This distinction – based on how fully-developed the language is – seems a more useful scale than the loglang/artlang distinction, based on aims and purposes that cannot always be known.

'Neographies,' the common Internet term for invented languages, points to the written nature of most constructed languages. As in most education systems in the world, principles that seem to apply to written language are applied exactly to spoken discourse, and literary authors imagine their languages – even when presenting speech forms – in terms appropriate to writing. This style is not surprising given that the languages involved are expressed in literary text and have no real native speakers to enunciate them. However, it also foregrounds the symbolic or emblematic value of the language itself rather than its value simply as a medium of communication, which spoken discourse foregrounds.

In George Orwell's (1948) *1984*, for example, the main character is employed on the 'Newspeak' dictionary. Newspeak is the version of English aimed at by the repressive state apparatus of IngSoc and Big Brother in the novel: its objective is to cut down the vocabulary of the language in order to diminish the capacity for complex or subversive thought. Clearly, the principles of Newspeak fly in the face of much current linguistic orthodoxy. The idea ignores the ever-shifting processes of linguistic change, ignores dialectal variation, regards dictionaries as comprising and fixing the lexicon, and makes a strong Sapir-Whorfian connection between language and the determination of thought. It also deals only with vocabulary and does not say much about syntactic expression, and it does not deal with the subversive and creative possibilities of metaphorical extension and compounding.

Of course, none of this matters, because Orwell was not extrapolating the future but caricaturing his present in 1948. Newspeak stands as a warning about linguistic impoverishment and the dangers of rhetorical manipulation by politicians and institutions. The novel itself is not written in Newspeak; presumably its political message could not be rendered in the language. No character in the novel even expresses themselves in an extended way in Newspeak: most of the material on the language is given in an appendix to the novel, and only the odd few words ('doublethink,' 'plusgood,' 'duckspeak') are used in the course of the narrative itself. Newspeak is a neograph that is gestured towards for its symbolic value rather than enacted.

Where invented languages are mentioned but do not appear fully, it is usually because they are imagined to be so far in advance of the reader's pitiful mind that the narrator cannot render them in a way which would be at all comprehensible. In Greg Bear's *Thistledown* series, for example, beginning with the 1985 novel *Eon*, the humans from the distant future have dispensed with the monodimensionality of natural language and augmented it with visual projected images and symbols:

> The President's advocate was not pleased with the news Olmy brought.
>
> 'The P.M. had no suspicion of this when you alone were sent?' Toller picted. The symbols that flashed between the two men came from pictor torques around their necks, devices which generated and projected the graphicspeak that had developed over the centuries in the Thistledown and in the Axis City. (Bear, 1985: 258)

'Picting' can only be referred to, not shown, in this way. The implication is that picting is not only far superior in propositional efficiency but also allows a greater precision of complex emotions and shading to be applied to communication.

This indirect gesturing is common for invented languages, with Thomas More adopting the tactic in his 1616 *Utopia*. At the end of the text, he adds "A metre of four verses in the Utopian tongue":

> Utopos ha Boccas peu la chama polta chamaan.
> Bargol he maglomi baccan soma gymnosophaon.
> Agrama gymnosophon labarem bacha bodamilomin.
> Volvala barchin heman la lavolvala dramme pagloni.

Looking suspiciously like a blend of morphemes from modern European languages, particularly Italian and Greek, these phrases are 'translated' into an English verse that takes up twice as many lines. Clearly the primary point is to emphasize the economy of the Utopian language and the poverty in which it can be only "rudely englished." The text ends with a note from "The printer to the reader," in which he apologizes for not reproducing the characters of the Utopian alphabet since, strange as they are, he does not have them yet.

By contrast, in his *Culture* novels, Iain M. Banks provides the graphology for his synthetic galactic language, Marain, but adopts the same strategy of withholding the lexicogrammar as being too advanced for contemporary readers:

> Those of you unfortunate enough not to be reading or hearing this in Marain may well be using a language without the requisite number or type of personal pronouns, so I'd better explain that bit of the translation.
>
> Marain, the Culture's quintessentially wonderful language (so the Culture will tell you), has, as any schoolkid knows, one personal pronoun to cover females, males, in-betweens, neuters, children, drones, Minds, other sentient machines, and every life-form capable of scraping together anything remotely resembling a nervous system and the rudiments of language. (Banks, 1988: 99)

Here, he gestures towards the language without actually revealing it. However, at the end of the novel, he does sign off the narrator using Marain graphology, the symbols of which comprise angular lines on a square grid and look to a nonreader like Japanese katakana graphemes. The alien writing is followed by the name of the narrator, and it is easy to work out that there is a phonetic correspondence between the symbol and the name.

In a note posted to several Internet newsgroups and which will appear in the second edition of his 1991 short story collection, *The state of the art*, Banks has worked out this systematic graphological system. A nine-bit binary code such as 'xooxxxxoo' can be drawn as a 3 x 3 grid:

xoo
xxx
xoo

This graph then resembles the Marain grapheme that looks like an alphabetical 'T' on its side – this represents the phoneme /w/. There are 512 possible symbols on the 3 x 3 grid, comprising all phonetic sounds articulatable by humanoids, plus mathematical operators and symbols for chemical elements and so on. Symbols can be rotated and mirrored, and similar symbols share phonetic properties. Further complexity can be achieved by increasing the 9-bit grid to a 16, 25, or larger size grid, and by cubing the grid into other dimensions. Banks adds that "while Marain was designed to be as quintessentially clear, concise and unambiguous a language as it is within the wit of human and machine to devise" it also "enables the Culture Minds fully to indulge their seemingly congenital predilection of unnecessary obfuscation, wilful contrariness and the fluent generation of utter and profound confusion in others." In spite of all the graphological specification, the lexicogrammatical workings of Marain remain hidden in the nature of the advanced technological utopia that is the Culture.

Some neographies, though, are worked out far beyond the requirements of the fictional world they occupy. The most famous are J.R.R. Tolkien's numerous constructed languages for the races of Men, Elves, Dwarves, Orcs and others in his fictional world most well-known through *The lord of the rings* series. Tolkien's invented languages include Telerin (the language of the Sea-Elves), Doriathrin (the mother tongue of Lúthien), Nandorin (the Green-Elven language), Khuzdul (the secret language of the Dwarves), Entish (the language of the tree-creatures, the Ents), Orkish, Adûnaic (the vernacular of Númenor), and the two most well-known and most developed, Quenya and Sindarin. Several of Tolkien's languages only have a few words and grammatical features (Entish is merely described as very long-winded and impossible to render in writing), but the last two are strongly reminiscent of Finnish and Welsh, and are fully worked out grammatically with large vocabularies. Quenya is High Elvish and Sindarin is Grey-Elven, with their own histories detailing their dialectal divergence and ultimately different linguistic patterns. Both have elaborate grammatical systems with a complex tense and aspect system, case inflections, and declensions, and rules for syntactic sequencing. Quenya, in particular, was designed for its aesthetic appeal, with Latin sounds blending with the Finnish-derived ones to reduce the number of consonants and so make the language sound more euphonious.

Clearly, Tolkien's invention becomes a scholarly activity beyond the artistic purpose of the novels, though it also adds a richness to the texture of his imagined worlds. The success of these inventions can be judged by the numbers of ardent enthusiasts still engaged in Elvish philology and in trying to piece together the development of Tolkien's linguistic imagination. These activities have also developed far beyond the boundaries of the fictional world in which they originated; and while they are not anywhere near natural languages, the Elvish languages approach a

degree of richness that raise them towards the level of auxiliary languages.

Functions and Assumptions of Invented Languages

In general, there are three broad functions of neographies in literature. The first function is elaborative: the language is present to lend an ornamental richness to the imagined landscape, and works essentially as detailed lyrical description. Klingon, in the *Star trek* universe primarily exists for elaborative purposes. Invented by linguist Mark Okrand for the film, Klingon is the language of an aggressive and war-like race and so it is marked by guttural, uvular phonemes that are felt to convey its harshness. Of course, this phonoaesthetic harshness is perceived only relative to English-speaking norms. Klingon has a dictionary and hundreds of speakers, and some Shakespeare plays have been translated. More eccentrically, portions of the Bible have been rendered into Klingon – directly from the Greek and Hebrew!

Secondly, invented language has an indexical function, which is to assist in the creation of the imagined world and increase the reader's sense of its plausibility. This function is indexical because it is one of the main mechanisms by which readers can determine the degree of accessibility between their own world and the imaginary world. A fully-fledged language helps to create a sense of realism and allows readers to build characters through a focalization in their own vernacular. Hergé's *Tintin* stories featured a Balkan country where Syldavian is spoken. This language was not fully developed by Hergé and includes some contradictory features, but it is drawn very clearly from Dutch and German. The language is being used to mark out the sense of difference and foreignness of the country, in relation to the French of Tintin and his readers.

Thirdly, neographies have an emblematic function in the sense that the language itself represents a thematically important idea. Newspeak, Utopian, Marain, and Brian Aldiss's psychedelic language are all thematically important carriers of the political polemic, comment, or satire of the works in which they feature.

Since most writers of literary fiction are not linguists, several of the assumptions on which their neographies are based do not correspond particularly well with modern linguistic orthodoxy. Most noticeable is the Sapir-Whorf hypothesis that seems to be held in its strongest possible form by many writers. Samuel Delany's *Babel-17* (1968) goes beyond Newspeak in imagining a language which, if learned, subverts the speaker's mind and makes them act traitorously without even realizing it. Neal Stephenson's (1993) *Snow crash* similarly imagines an ancient Sumerian language that is close to the linguistic infrastructure of human brains, which can be manipulated by 'neurolinguistic hackers' in order to 'crash' the mind of anyone who reads it. The literalness of the notion of deep structure and the linguistic determinism displayed in these texts is striking.

The norms for evaluations assumed by many English writers are always English language norms, so alienness is indexed by phonetic and lexicogrammatical systems that are exotic only in relation to English. This cultural specificity is not surprising but gives rise to many of the assumptions about phonoaesthetics that are manifest in invented languages.

Finally, it must be remembered that the literary context is an artistic one, where poetic license ought to be allowed. Fictional extrapolations in the dimension of linguistics seem to be evaluated in a more rigid way than comparable speculations in other sciences. It is striking that debates over linguistic patterns adopted by literary writers become very vehement, as if the language itself, even though imaginary in origin, has a status and reality of its own, and a life beyond the world in which it belongs.

Iordan, Iorgu (1888–1986)

M C Augusto, University of Utrecht, Utrecht, The Netherlands

Iorgu Iordan was born the son of a modest family, on September 29, 1888 in Tecuci, a Moldavian town in Romania, and died on September 19, 1986. He studied German Language and Literature, and Law, and finished a Ph.D. on Modern Philology at the University of Iasi (1919) with a dissertation on Romanian phonetics.

From his contact in the early 1920s with other linguists (W. Meyer-Lübke, L. Spitzer, Ferdinand Brunot, Antoine Meillet, and Mario Roques, among others) in Berlin, Bonn, and Paris, but especially from the courses he followed with W. Meyer-Lübke, he became acquainted with the comparative method. This approach of the linguistic object he faithfully continued and developed in his career as a teacher and scholar. At the same time, his attention in his classes and research was increasingly being devoted to the "individual aspect of the evolution of the language," following an idealistic methodology à la K. Vossler. His friendship in Bonn with Leo Spitzer, who defended an idealistic stylistics, must have been of great importance to this development.

Once in Paris, the contacts with J. Gilliéron, whose seminars he attended, had a formative impact on Iorgu Iordan and increased his interest in the investigation about the individual and geographic facets of the language.

All these aspects and influences were absorbed into his scientific production. At least four books reflect the linguistic conceptions and guidelines of the prominent linguist that Iorgu Iordan was: *Rumänische Toponamastik* (Bonn-Leipzig, 1924), *Limba romînă actuala. o gramatica a 'greselilor'* (1943, rev. 1948), *Stilistica limbii române* (1944, rev. 1975), and *Introducere în studiul limbilor romanice. Evoluţţia şi starea actuală a lingvisticii romanice* (1932, rev. 1962). The first has contributed in a special way to a better international knowledge of the Romanian language and has promoted its study at the level of the comparative studies of the Romance languages, earning him the epithet of patriarch of Romanian linguistics. The fourth, translated into many languages, has launched Iorgu Iordan as being among the most remarkable linguists. In this book, the author presents a complete, accurate, and objective critical review of the principal currents and its scholars that represent the linguistics scenario in the first half of the 20th century. Regarding the Romance languages, another important study was the reelaboration of the book *Introducere în linguistica romanică* (1957) in collaboration with Maria Manoliu-Manea, which was published with the same title in 1965. The Spanish edition of this book, *Manual de Lingüistica románica*, translated by Manuel Alvar (1972), has been an indispensable item in every bibliography concerning the Romance languages.

His numerous studies on the comparative aspects of the Romance languages did not prevent him from dedicating himself also to the specialized study of Spanish. In this respect, he also was responsible for the creation of the first chair of Spanish Studies in Bucharest.

In addition to his scholarly activities, Iorgu Iordan held various notable administrative positions. These included the presidency of national and international linguistic associations, ambassador (in Russia, 1945–1947), visiting professor, dean of the Faculty of Philology (1947–1950 and 1956–1957), rector of the University of Bucharest, and many others. However, the founding of the Institute of Linguistics of Bucharest, which he ran as director from 1949 to 1952 and later from 1958 to 1970, and the creation of a department concerned with the Romance Languages reveal his capacity and intuition as a scientific administrator. As a director of this institute, Iorgu Iordan was responsible for two major scientific projects: the coordination of the Dictionary of

In addition to his scholarly activities, Iorgu Iordan held various notable administrative positions. These included the presidency of national and international linguistic associations, ambassador (in Russia, 1945–1947), visiting professor, dean of the Faculty of Philology (1947–1950 and 1956–1957), rector of the University of Bucharest, and many others. However, the founding of the Institute of Linguistics of Bucharest, which he ran as director from 1949 to 1952 and later from 1958 to 1970, and the creation of a department concerned with the Romance Languages reveal his capacity and intuition as a scientific administrator. As a director of this institute, Iorgu Iordan was responsible for two major scientific projects: the coordination of the Dictionary of

Rumanian, the so-called *Dicţionarul Limbii române al Academiei*, and the elaboration of the *Crestomaţia Romanică* (1962–1972). Many well-known Romanian linguists such as Maria Iliescu, Maria Manoliu-Manea, Sanda Reinheimer, and Marius Sala have collaborated on this last project.

As an international recognition of his scientific value, Iorgu Iordan was made honorary president, from 1968 onward, of the *Societé de Linguistique Romane*, which he cofounded; he was a member of the *Junta Directiva de la Asociación International de Hispanistas*, a collaborator on many Editorial Boards of Linguistic Journals, and *Doctor Honoris Causa* of several universities (Berlin, Gand, Rome, Montpellier, etc.).

As a first-class teacher and researcher, Iorgu Iordan also stood out as a source of knowledge and inspiration for his students. Many of them would become distinguished scholars working all over the world, nevertheless united by a tangible bond between them, once forged by their old teacher.

Iran: Language Situation

B Ingham, School of Oriental and African Studies, University of London, UK

Main Language Families

Three main languages families are spoken in Iran, covering discrete areas, but overlapping in places. This is facilitated by the thinness of the population in parts. The majority group in terms of number of speakers and geographical area is the Iranian group of the Indo-European family, spoken as original local languages over most of the country except in Azerbaijan and Khuzistan. The national language Persian (Farsi) was originally a dialect of the region of Fars and has a written history in the present alphabet of about 1000 years. It is spoken in all the main cities and in the northeast. Kindred dialects are those of Fars and of the Lur tribes of the south. Other Iranian varieties include (Schmitt, 1989: 294–295) (i) Kurdish in the west, (ii) Tati and Talishi in the north west, (iii) Gilaki and Mazandarani north of the Elburz mountains, (iv) Central dialects around Hamadan, Tehran, Isfahan, and Yazd, and (v) Baluchi in the southeast. Most of these are quite distinct from Farsi and not mutually intelligible with it. However, only Kurdish, Baluchi, and to a lesser extent Luri are usually accorded separate language status, because of the political power of their speakers. Kurdish and Baluchi are written languages. The next in size is the Turkic group, represented by Azeri in the north west (Azerbaijan), by Uzbek, spoken by the Turkomans in the northeast, by large numbers of Turkish speakers in Fars in the southwest, of particular importance being the tribal Qashqai and Khamse and in other localities, spreading round from northeast to southwest interspersed with the Iranian-speaking population. The two groups overlap considerably, this sometimes resulting from resettlement by previous governments. The third, the Semitic group, is represented by Arabic spoken in Khuzistan in the southwest and at various localities along the Gulf Coast, the Makran Coast and possibly also by some of the nomadic population of Fars among the Khamse. There are also Arabic speaking populations in the northeast around Sarakhs and in the east around Birjand. The above are all non-minority languages, spoken over large areas by native populations spanning the borders of Iran and neighboring states. Persian spreads into Afghanistan (known there as Darri) and Tadjikistan (known there as Tadjik). Turkic spreads into Turkey and Azerbaijan in the west, into Turkmenistan and other central Asian states in the northeast, and into Afghanistan in the east. Arabic spreads westward into Iraq. The population of the Persian Gulf islands speak Arabic or Persian or are bilingual.

Minority Languages

Minority languages, spoken by mainly, but not exclusively urban ethnic minorities include Armenian, an Indo-European language spoken by the Christian Armenians, Georgian, a Caucasian language spoken by the Georgian Christians, Syriac, a Semitic language spoken by the Nestorian Christian Assyrians (āšūrīhā) an Arabic dialect spoken by some of the Jewish population, akin to the *qiltu* dialects of Northern Iraq (Blanc, 1964: 7), and an Indo-European variety spoken by some of the Ghorbati or Kawli, the Gypsies of Iran, which may be a dialect of Persian.

Status of the Different Languages

Persian is the main medium of instruction in schools and is the language of the media and the administration. Turkic, Kurdish, Arabic, and Baluchi, however, are of considerable local importance, being the language of rural elites. The case of Arabic is slightly different since Khuzistan, being the major oil region, has undergone considerable immigration and urbanization, so that Arabic is heard more often in rural areas. Here we intend the spoken dialect, which is akin to the southern *gilit* type of Southern Iraq (Blanc, 1964: 7). The classical, literary language is accorded high esteem especially by the present regime because of its association with Islam. Persian is understood universally in the towns and widely in rural areas, but even after the efforts of the Pahlavi regime to universalize it by means of education and the media, it is not everywhere spoken or even understood in rural areas. Note also that the appellation Arab or Turk does not necessarily imply a language affinity, but may be only a political one, as with some of the 'Arab' tribes of Fars and Afghanistan who speak Persian or Turkish (Barth, 1961: 131). The main languages taught in schools are Classical Arabic, taught as a language of liturgy and scholarship, but not as a spoken tongue, and English. At an earlier stage, French was more common.

Iran: Scripts, Old Persian, Aramaic, Avestan

P O Skjærvø, Harvard University, Cambridge, MA, USA

Writing systems for Iranian languages include cuneiform (Old Persian); scripts descended from 'imperial' Aramaic (earliest monuments of Chorasmian, Sogdian, Parthian, and Middle Persian, as well as Avestan, derived from the Middle Persian script); two Syriac scripts, Estrangelo or 'Manichean' (Middle Persian, Parthian, Bactrian, Sogdian, Modern Persian) and 'Nestorian' (Christian Sogdian, Modern Persian); Hebrew (Modern Persian and local Persian dialects: Judeo-Persian); Arabic (Modern Persian, Chorasmian, Kurdish, Pashto, Balochi); Brahmi (Khotanese, Tumshuqese, Sogdian); Greek (Bactrian); Cyrillic (Ossetic, Tajik); Georgian (Ossetic); and Latin (Kurdish, Ossetic).

Old Persian Cuneiform

Old Persian is written in a cuneiform script, but with only a small number of signs. There are 3 vowel signs ⟨a, i, u⟩, 33 signs of the form 'consonant + vowel' (CV), 8 logograms, a word separator, and numerals. The CV signs contain the vowels *a*, *i*, or *u* ⟨Ca, Ci, Cu⟩, but the set of ⟨Ci⟩ and ⟨Cu⟩ signs is not complete. There are only 4 ⟨Ci⟩ signs and 7 ⟨Cu⟩ signs, and most of the ⟨Ca⟩ signs also have to serve for the missing ⟨Ci⟩ and ⟨Cu⟩ signs. Thus, crucial morphological distinctions such as the 3rd singular endings active *-tiy* and middle *-taiy*, both ⟨-ta-i-ya⟩, are not indicated. The ⟨Ca⟩ signs are also used where a consonant is followed by no vowel, before other consonants, or in word-final position (only *m*, *r*, and š).

The vowel signs ⟨a, i, u⟩ are used initially (when the word begins with a vowel). Medially, ⟨a⟩ is used to write long *ā*. The signs ⟨i⟩ and ⟨u⟩ are used medially to write short *i* and *u* and long *ī* and *ū*. They are preceded by the ⟨Ci⟩ and ⟨Cu⟩ signs whenever these exist. Very rarely in the attested corpus, ⟨Ci⟩ and ⟨Cu⟩ are used alone to indicate consonant plus *i* or *u*. In final position, they are followed by ⟨ya⟩ and ⟨va⟩ (*-ĭ̄y*, *-ŭ̄v*).

Certain sounds that are expected from the etymology of the words are not written in the Old Persian script, notably *h* before *u* and *m* and nasals before consonants, although they may be present both in transcriptions into other languages and in later stages of Persian:

h: *Ahuramazdā* is spelled ⟨a-u-ra-ma-za-da-a⟩, but ⟨a-ḫu-ru-ma-az-da-'⟩ in Akkadian; the Middle Persian form is *Ōhrmazd*; *ahmiy* 'I am' is spelled both ⟨a-mi-i-ya⟩ and ⟨a-ha-mi-i-ya⟩; with *tauhmā* ⟨ta-u-ma-a⟩ 'family', cf. Av. *taoxman*-'offspring', NPers. *toxm* 'seed'; and with *ahrīka* ⟨a-ra-i-ka⟩ 'on the side of the Evil one', cf. Mid. Pers. *ahrīmen* 'the Evil one';

nasals: *Kambŭ̄jiya-* is spelled ⟨ka-ba-u-ji-i-ya⟩, but Elamite ⟨kán-bu-zi-ia⟩, Akkadian ⟨kam-bu-zi-ia⟩, Aramaic ⟨kmbwzy⟩, Greek *Kambúsēs*; with *bandaka* 'bondsman', spelled ⟨ba-da-ka⟩, cf. Middle Persian *bandag* 'servant'.

The script was therefore not quite phonemic. It is also not certain to what extent the written consonants were unambiguous; for instance, diachrony and synchrony suggest that ⟨ja⟩ may be for both /ǰ/ and /ž/, if these were separate phonemes. (See Table 1.)

Numerals

The numerals are simple: the unit is 𐏑 '1', 𐏒𐏑 is '3', etc.; 'ten' is 𐏓 (𐏓𐏒𐏒𐏒𐏒𐏑 '19', etc.); and '20' is' 𐏔 (𐏔𐏒𐏒𐏒𐏑 '27', etc.). The only higher numeral attested is 𐏕 𐏔 '120'.

Scripts Derived from Aramaic

All the Iranian scripts derived from Aramaic express vowels other than short *a* by means of *matres lectionis* as follows: ⟨'⟩ initially = short or long *ă̄-* (long initial *ā-* is often written ⟨''-⟩); between vowels = long *ā* (in the Sogdian script also short *a*).

⟨y⟩ and ⟨w⟩: between vowels = short or long *ĭ̄* or *ĕ̄* and *ŭ̄* and *ŏ̄*, respectively; in the Sogdian script ⟨'y⟩ and ⟨'w⟩ is used for *āy* and *āw* (also ⟨''y, ''w⟩) or instead of ⟨y, w⟩; in the Manichean script initial ⟨ʿy-⟩ *ĭ̄-* may be distinguished from ⟨'y⟩ *ē-*. In Christian Sogdian in the Nestorian Syriac script, vowel quality/quantity is sometimes indicated by vowel marks.

Scripts Derived from Imperial Aramaic

During the Achaemenid period (549–330 B.C.E.), Aramaic ('Imperial Aramaic') was used as the chancellery language, and the Aramaic script was subsequently, at the latest by the Parthian period (ca. 210 B.C.E.–224 C.E.), adopted by several Iranian states: Parthia, the local Persian dynasty, Chorasmia, and Sogdiana. There is a small corpus of Aramaic documents from Bactria from the 4th century B.C.E., and Aramaic was also used in the edicts of King Aśoka (3rd century B.C.E.) written in ancient Bactria and Gandhara (northern Pakistan).

From the early Parthian period (2nd–1st centuries B.C.E.) there are a number of inscriptions, some of which are clearly in Iranian languages, presumably Parthian (thus, e.g., the wine receipts from Nisa, east of the Caspian Sea), although the fact is obscured by

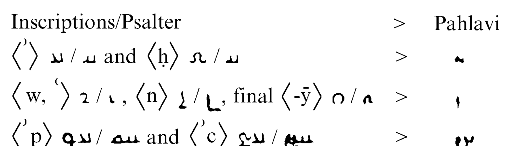
the extensive use of aramaeograms (heterograms, ideograms). Others are more likely to be in faulty bureaucratic Aramaic. By the 2nd century C.E., the official Parthian script had reached its standard form.

The Middle Persian variant, seen on the coins of pre-Sasanian kings, evolved in southern Iran in the late Parthian period and became the official script of the Sasanian empire (224–651 C.E.), seen in royal and private inscriptions from the 3rd to the 5th centuries. Variants of this script are found on the coins of the Sasanian kings. A more cursive variant of the Middle Persian script used for writing on paper is the so-called Psalter script, known from a fragmentary manuscript of the Psalms of David found in Chinese Turkestan. This script developed via a simplified epigraphic variant (known from funerary inscriptions) into the so-called (Book) Pahlavi script, used in the Zoroastrian books. The final stage is the almost indecipherable script used in the Pahlavi papyri and parchments of the late Sasanian early Islamic period.

The Avestan script is a composite script made on the basis of the Psalter and Book Pahlavi scripts.

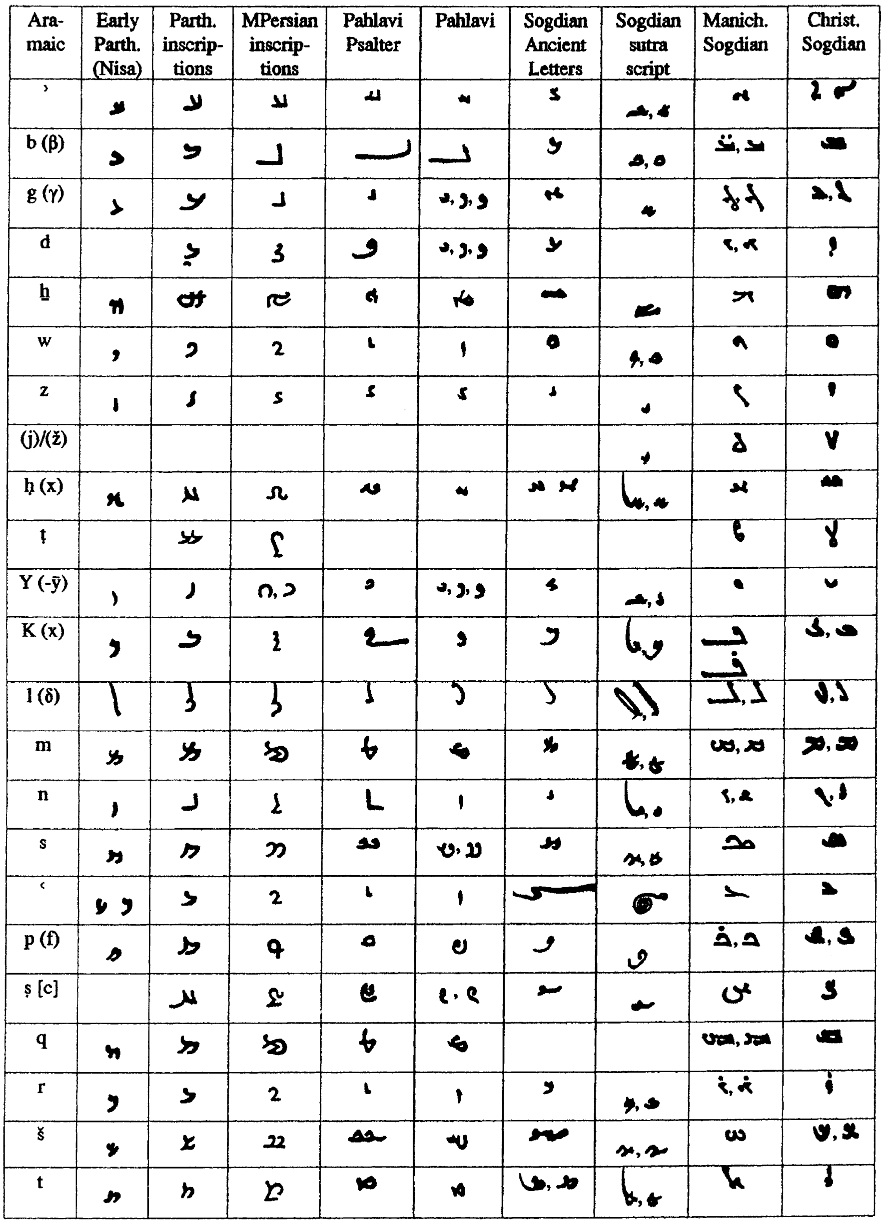
The Chorasmian script is known from a few inscriptions; it was later replaced by the Arabic script.



The Sogdian script is known in three principal forms. The earliest form is used in letters written on paper and dating from the early 4th century C.E. and in a few short inscriptions from northern Pakistan. The common Sogdian script is a cursive variant found in secular documents and in Buddhist and Manichean manuscripts, of which two stages are distinguished: the 'formal' or 'sutra script,' and the more ambiguous 'Uighur' variant. (See Table 2.)

Use of Aramaic Letters

The Aramaic alphabet contained letters for numerous sounds not found in Iranian. Some of these were adopted to write sounds that were not found in Aramaic (⟨ṣ⟩ for Iranian *č* [tʃ] and ⟨ḥ⟩ for the fricative velar /x/; ⟨l⟩ in Sogdian for /δ/), but even so the Aramaic alphabet contained more letters than were needed, and ⟨ṭ, ʿ, q⟩ were never used in writing Iranian words (except with numerical values; differently in the Syriac scripts). In Middle Persian, ⟨l⟩ is used more often than ⟨r⟩ (= ⟨w⟩) to write *r*. In Aramaic documents from the mid-Parthian era, ⟨ḥ⟩ and ⟨ẖ⟩ are being confused, and, in Parthian and Middle Persian, ⟨ẖ⟩ is confined to final position in aramaeograms while ⟨ḥ⟩ is written elsewhere, regardless of their etymologies. Aramaic ⟨ẖ⟩ was also used in Parthian and Sogdian for the feminine ending -*ă*, which resembled the Aramaic ending -*ā*, but this became a mere convention when the ending was lost both in Parthian and in Sogdian in 'heavy' stems.



The Middle Persian Script

Typical of the development of the Middle Persian script is the ever-increasing merger of letters into the same shape, for example:

Out of the 22 distinct letters of the Aramaic alphabet and the 18 of the inscriptions and the *Psalter*, the Pahlavi alphabet distinguishes only 12 letters, which have to do duty for 21. As we see from Table 3, some of these letters have at least two different orthographic values (Psalter forms in parenthesis). As the script

Table 2 The Main Iranian scripts developed from Aramaic and Syriac

The table contains a selection of initial, medial, and final variants.

is strongly cursive, there are numerous positional variants.

Of these, ⟨ʿ⟩ and ⟨q⟩, as well as ⟨h̲⟩ (= ⟨m + w, n⟩) are found only in aramaeograms, transliterated as ⟨O, Q, E⟩, and ⟨Q⟩ is found only in ⟨QDM⟩ *abar* 'on'.

In Indian manuscripts, ⟨š⟩ is replaced by ⟨y'⟩.

To remedy the ambiguities, diacritical marks are sometimes used (not always etymologically correct): ⟨d⟩, ⟨g⟩, ⟨y⟩, ⟨j̆⟩ (initial).

In practice, therefore, most of the time Pahlavi has to be read word by word or morpheme by morpheme, rather than letter by letter. For instance, *Ohrmazd*, inscr. ⟨'whrmzd⟩ became ⟨'whrmzd⟩ = ⟨'w'wm'⟩ = ⟨'nhwm'⟩ (hence the traditional Parsi pronunciation *anhuma*). The word *yazdān* 'god(s)', inscr. became ⟨yzd̲'n'⟩ = ⟨y''ww⟩, which was distinguished from *dēwān* 'demons', inscr. , Pahl. ⟨ŠDYAn'⟩ = ⟨š'''ww⟩ (= ⟨y''''ww⟩ with ⟨y'⟩ for ⟨š⟩) by the number of loops,

Table 3 The 12 distinct Pahlavi letters

	ʾ ( ), h ( )		z		p
	b		k		c
or	d ( ), g ( ), y ( )		l		š
	w, ʿ, r ( ), n ( )		m, q		t

which in the manuscripts are sometimes multiplied even further (, etc.). The word *mǎzdēsn* 'Mazdayasnian' is usually written like *mahist* ⟨mhyst'⟩ 'greatest' with ⟨yt⟩ for ⟨sn⟩.

The name of the devil, Ahrimen, is sometimes written up-side-down .

The Avestan Script

The Avestan script was invented probably sometime in the 6th century C.E. in order to write down the Avestan texts, which until then had been transmitted only orally. It is an alphabetical script, in which each allophone of the language as recited at the time corresponds to one letter. The earliest known forms of the Avestan and Pahlavi scripts are those of the 13/14th-century manuscripts and probably represent later developments of the original script. Some letters may have been added in the course of time. (See Table 4.)

The alphabet was based upon the official Pahlavi script, using diacritical marks (e.g., ⟨ī⟩ and ⟨ū⟩ from ⟨i⟩ and ⟨u⟩ and some letter forms from different stages of the Pahlavi script (e.g., Psalter ⟨d⟩). It has also been suggested that ⟨ə⟩ was adopted from Greek ε.

By the time of the earliest manuscripts, the original value of some of the letters was no longer known, notably, the distribution of the three sibilants ⟨š, ş, š́⟩ is not consistent in the manuscripts, and their values have been inferred on linguistic grounds. Several letters are found only in certain manuscripts (e.g., ⟨ń⟩ and ⟨ġ⟩). ⟨y, Y⟩, and ⟨v⟩ are used only initially, while ⟨uu⟩ and ⟨ii⟩ are used medially.

Syriac Scripts

Two forms of Syriac script were used for Iranian languages. The Manichean script, a modified estrangelo (sometimes, but probably apocryphally, ascribed to Mani), was used for Middle Persian, Parthian, Bactrian, Sogdian, and Persian (it was also used for the non-Iranian Tokharian and Old Turkish).

Table 4 The Avestan alphabet

a	ā	ạ̊	å	ą
i	ī	e	ē	ə

y-				
v-			x^v	$ŋ^v$
s	z		h	ṇ
š	ž			
š́				
ṣ̌				

The Nestorian script was used by the Christians at Turfan.

The Manichean Script

As in the Sogdian script, Syriac ⟨l⟩ was used to write *δ*. Diacritics were used to express specifically Iranian sounds, e.g., superscript double dots over ⟨b⟩ = ⟨*β*⟩, ⟨g⟩ with a loop = ⟨*γ*⟩. The only new letter, ⟨ ⟩, is commonly transliterated as ⟨ǰ⟩, while ⟨z⟩ with double dots is transliterated as ⟨ž⟩.

Initial sibilant + stop took a prosthetic vowel written ⟨ʿ⟩ (Mid. Pers. ⟨ʿsp'ẖ⟩ = *əspāh* 'army', Parth. ⟨ʿsp'd⟩ = *əspāδ*). Words with *ē* or *ī* and *ō* or *ū* may be distinguished by the use of ⟨ʿ⟩ or ⟨'⟩ (e.g., Mid. Pers. ⟨'yg⟩ *ēg* 'then' versus ⟨ʿyg⟩ *ī(g)*, relative particle; ⟨zwr⟩ *zōr* 'strength' versus ⟨zʿwr⟩ *zūr* 'deception').

Sometimes, letters marking vowels are left out and the omission indicated by super/subscript dots (e.g., ⟨w⟩ with double dots for ⟨'wd⟩ *ud* 'and' and ⟨š⟩ with double dots for ⟨'wš⟩ *u-š* 'and he/by him/his'). In the Bactrian Manichean script, the double dots were used to distinguish the palatal *ś* and *ź* from the presumably palato-alveolar *š* and ž.

The Nestorian Script

This script included vowel marks and contains a new letter (corresponding to Man. , but commonly transliterated as ⟨ž⟩). The letters ⟨t⟩ and ⟨ṭ⟩ are most often

used for θ and *t*, respectively, but in a few manuscripts ⟨ṭ⟩ is *t* and ⟨ṯ⟩ is θ. Vowels are marked using the Syriac pointing system, which makes this the only variety of Sogdian script in which the crucial distinctions between *a-* and *ā-*, *ĭ* and *ĕ*, *ŭ* and *ŏ* are indicated in the script. Short *a* is noted also with other consonants, e.g., *wa*.

Iran: Language Situation

B Ingham, School of Oriental and African Studies, University of London, UK

Main Language Families

Three main languages families are spoken in Iran, covering discrete areas, but overlapping in places. This is facilitated by the thinness of the population in parts. The majority group in terms of number of speakers and geographical area is the Iranian group of the Indo-European family, spoken as original local languages over most of the country except in Azerbaijan and Khuzistan. The national language Persian (Farsi) was originally a dialect of the region of Fars and has a written history in the present alphabet of about 1000 years. It is spoken in all the main cities and in the northeast. Kindred dialects are those of Fars and of the Lur tribes of the south. Other Iranian varieties include (Schmitt, 1989: 294–295) (i) Kurdish in the west, (ii) Tati and Talishi in the north west, (iii) Gilaki and Mazandarani north of the Elburz mountains, (iv) Central dialects around Hamadan, Tehran, Isfahan, and Yazd, and (v) Baluchi in the southeast. Most of these are quite distinct from Farsi and not mutually intelligible with it. However, only Kurdish, Baluchi, and to a lesser extent Luri are usually accorded separate language status, because of the political power of their speakers. Kurdish and Baluchi are written languages. The next in size is the Turkic group, represented by Azeri in the north west (Azerbaijan), by Uzbek, spoken by the Turkomans in the northeast, by large numbers of Turkish speakers in Fars in the southwest, of particular importance being the tribal Qashqai and Khamse and in other localities, spreading round from northeast to southwest interspersed with the Iranian-speaking population. The two groups overlap considerably, this sometimes resulting from resettlement by previous governments. The third, the Semitic group, is represented by Arabic spoken in Khuzistan in the southwest and at various localities along the Gulf Coast, the Makran Coast and possibly also by some of the nomadic population of Fars among the Khamse. There are also Arabic speaking populations in the northeast around Sarakhs and in the east around Birjand. The above are all non-minority languages, spoken over large areas by native populations spanning the borders of Iran and neighboring states. Persian spreads into Afghanistan (known there as Darri) and Tadjikistan (known there as Tadjik). Turkic spreads into Turkey and Azerbaijan in the west, into Turkmenistan and other central Asian states in the northeast, and into Afghanistan in the east. Arabic spreads westward into Iraq. The population of the Persian Gulf islands speak Arabic or Persian or are bilingual.

Iranian Languages

P O Skjærvø, Harvard University, Cambridge, MA

Iranian languages have been spoken for 3000 to 4000 years in various parts of southern Russia and the Caucasus, Central Asian republics, Xinjiang, Afghanistan, Pakistan, Iran, Iraq, and Turkey, as well as in the diaspora. The language spoken by the largest number of people today is (New) Persian (*see* **Persian, Modern**), or Farsi. Iranian languages are closely related to the Indo–Aryan (*see* **Indo–Aryan Languages**) languages, with which they constitute the Indo–Iranian (*see* **Indo–Iranian**) subgroup of the Indo–European language family, to which most European languages also belong.

The Iranian languages are known from three main periods, commonly classified as Old, Middle, and New (modern) Iranian. Historically, this division corresponds roughly to (1) the pre-Achaemenid and Achaemenid period (down to ca. 300 B.C.E.), (2) the period down to the Arabic invasion of Iran and the spread of Islam (7th century C.E. in the west, up to 11th and 12th centuries C.E. in the east), and (3) the Islamic period.

Iranian languages are written in a large variety of ancient and modern scripts (*see* **Iran: Scripts, Old Persian, Aramaic, Avestan**).

Old Iranian Languages

Avestan (*see* **Avestan**), the language of the Avesta, was spoken in areas of Central Asia, Afghanistan, and eastern Iran from the 2nd millennium till about 500 B.C.E. Two stages of the language are known, the older of which is comparable to the oldest Indic seen in the Rigveda and was therefore probably spoken about the mid 2nd millennium B.C.E., while the younger is comparable to Old Persian and was probably spoken ca. 1000–500 B.C.E. The Avestan texts were transmitted orally for 1000 to 2000 years and written down only in about the 6th century C.E.; the earliest manuscripts date from the 13th century. Its phonetic form is therefore that of the latest oral transmitters. The present Avestan corpus is relatively small.

Old Persian (*see* **Persian, Old**), ancestor of Middle and New Persian, was spoken in southwestern Iran in the first half of the 1st millennium, till about 400 B.C.E. It was the official language of the Achaemenid dynasty and was written in a cuneiform script. The Old Persian corpus is quite small.

Numerous words in the Old Persian inscriptions have a phonetic form different from what is considered to be genuinely Old Persian. It is assumed these are from Median, a language spoken to the north of Old Persian, of which no texts survive.

Middle Iranian Languages

Khotanese (*see* **Khotanese**), spoken in the kingdom of Khotan in southwestern Xinjiang, is known from a variety of texts dating from about the 6th century to the end of the 10th century C.E. Tumshuqese, spoken in Kucha in northwestern Xinjiang, is known from the same type of sources, but much less well. These two languages were written in the southern and northern variants of Brahmi, respectively.

Sogdian (*see* **Sogdian**), spoken in Sogdiana, modern Central Asia, is known from texts dating from the 4th to the 10th century. It was written in Sogdian, Manichean, Syriac, and, occasionally, northern Brahmi scripts.

Chorasmian (*see* **Chorasmian**), spoken in the Chorasmian state along the upper Oxus/Syr Darja as late as the 14th century, is known from inscriptions, coins, and interlinear glosses in two Arabic works, a legal work and a dictionary. It was originally written in Chorasmian, later in Arabic script.

Bactrian (*see* **Bactrian**), spoken in the Greco–Bactrian kingdom founded by soldiers of Alexander the Great in northern Afghanistan, is best known from royal inscriptions and private documents dating from the 2nd to the 8th century. It was written in lapidary and cursive Greek and in Manichean scripts.

Parthian, spoken in the Parthian kingdom to the northeast of the Caspian Sea, is known from inscriptions, letters, economic and legal documents, and Manichean texts dating from about the 1st century B.C.E. to the 10th century. It was written in Parthian and Manichean scripts.

Middle Persian (also Pahlavi; *see* **Pahlavi**), was spoken in southwestern Iran and became the official language of the Sasanian dynasty. It is known from a large variety of texts, notably Zoroastrian texts, dating from about the 1st century B.C.E. to the 13th century, although it had been replaced by modern Persian as a spoken language by about the 8th century. It was written in Middle Persian and Manichean scripts.

New Iranian Languages

This section addresses the main literary languages spoken today, many of them now also in the diaspora, especially in Europe and America.

Various forms of Persian (*see* **Persian, Modern**) are spoken throughout Iran, Afghanistan, Tajikistan, and in adjacent areas. It is written in Arabo–Persian, Cyrillic (Tajik), and Hebrew scripts (Judeo–Persian).

Ossetic (ossette) is spoken in Ossetia, in the southern Caucasus, in two main variants, Digoron (the more archaic) and Iron, with subvariants. It is written in the Cyrillic script, except in the south, where Georgian is used.

Kurdish (northern, central, and southern) is spoken in three principal variants in eastern Turkey and Syria, northern Iraq, and western Iran, as well as in surrounding areas. It is written in a modified Persian or standard Turkish Latin script.

Balochi (*see* **Balochi**; or Baluchi, in several dialects) is spoken in eastern Iran and western Pakistan, but also in southern Afghanistan and Central Asia. It is written in the Arabo–Persian script.

Pashto (*see* **Pashto**; several dialect groups) is spoken mainly in Afghanistan and Pakistan. It is written in the Arabo–Persian script.

All the modern languages contain a large number of Arabic words and a smaller number of Turkish words. The easternmost dialects have also borrowed extensively from Indic languages. Differently, Ossetic has borrowed extensively from the neighboring Caucasian languages.

Nonliterary languages and dialects comprise the following:

Northwestern and central Iran: Taleshi on the western shore of the Caspian Sea and Tati dialects from Iranian Azerbaijan through the Central Province and into Gilan; the Caspian dialects (Gilaki in Gilan, Mazanderani, and several dialects on the northern edge of the great salt desert, the Dasht-e Kavir); Gurani (Bajelani) and (including Awromani) in eastern Iraq and western Iran; and Zaza (Dimli) in eastern Turkey; and the Central dialects, comprising a number of more or less interrelated dialects spoken north and south of the Dasht-e Kavir.

Southwestern and southern Iran: Lori (Luri) (in several varieties) and Bakhtiari; Fars dialects; Larestani (in several dialects) in Larestan; dialects in the area from Bandar-e ʻAbbas (Bandari) and Hormoz to Minab and Bashkardi in Bashakerd; and Kumzari on the Musandam peninsula across the Strait of Hormoz (it is unknown whether this is spoken today).

Afghanistan and Central Asia: Parachi and Ormuli (Ormuri) in central Afghanistan and across the border in Pakistan; Ishkashmi and Sanglechi to the west of the Wakhan corridor; Yidgha and Munji/Munjani in eastern Afghanistan and western Pakistan respectively; the Yazghulami-Shughni (Yazgulami-Shugni) group in northern Afghanistan and Central Asia, including Sarikoli in western Xinjiang; Yaghnobi (Yagnobi) in the Yaghnob valley in Tajikistan; and Wakhi in the Wakhan corridor in northeastern Afghanistan.

Genetic Relationships among the Iranian Languages

Only the Persian languages are descended in a more or less direct line. Of the other dialects, the following are more closely related than others: Yidgha–Munji and Bactrian; Yaghnobi and Sogdian; and Wakhi and Khotanese.

Characteristic Phonological Features of Iranian Languages

Phonetic developments differentiating Iranian from its Indo-Iranian ancestor and so also distinguishing it from Old Indic include the following (*see also* **Indo–Iranian**):

1. Indo-Iranian *s* after vowels became Iran. *h* (e.g., OInd. *asura-*, Av. *ahura-* ʻlordʼ).
2. Voiced aspirated stops and affricates lost the aspiration (e.g., OInd. *bhara-*, OIran. *bara-* ʻcarryʼ; OInd. *dhā-* ʻto placeʼ and *dā-* ʻto give,ʼ OIran. both *dā-*; Indo-Iran. **ǰ*^{h} *an-* ʻstrikeʼ > OInd. *han-*, Av., OPers. *jan-*).
3. Indo–European palatal velars (*k̂, ĝ, ĝ*^{h}) and palatalized velar stops (*k*^{y}, *g*^{y}, *g*^{yh}) developed differently in Indic and Iranian (approximate phonetic values: *ś* [ʃ], *ć* [tʃ], *ź* [ʒ], *j́* [dʒ], *š* [ʂ], *č* [tʂ], *ž* [ʐ], *ǰ* [dʐ>]):

IEur.	proto-IIr.	OInd.	proto-Ir.
**k̂, ĝ, ĝ*^{h}	**ć, j́, j́*^{h}	*ś, ǰ, h*	**ć*, **j́*, **j́*
**k, g, g*^{h}	**k*^{y}, *g*^{y}, *g*^{yh} > **č, ǰ, ǰ*^{h}	*č, ǰ, h*	**č*, **ǰ*, **ǰ*

4. The Indo-Iranian unvoiced stops *p, t, k* became spirants *f*, *θ*, *x* before other consonants, including original laryngeals (*H*) (OInd. *cakra-*, Av. *caxra-* ʻwheelʼ; OInd. *trita-*, Av. *θrita-* ʻthirdʼ; OInd. *priya-*, Av. *friia-* ʻdearʼ; Indo-Iran. **ratHa-*, OInd. *ratha-*, Av. *raθa-* ʻchariotʼ; but **pt* → **pt* > Av. *pt*: Av. *hapta* ʻseven,ʼ NPers. *haft*).
5. The geminated dentals *-tt-*, *-dd*$^{(h)}$*-* (*-t*^{s}*t-*, *-d*^{z}d$^{(h)}$-) became *-st-*, *-zd-* (OInd. *vitta-*, Av. *vista-* ʻfoundʼ < *vid-*; OInd. *addhā* ʻtruly,ʼ OPers. *azdā* ʻwell-knownʼ).
6. Indo–Iranian laryngeals remained between vowels but were lost between consonants (Iran. **daHah* ʻgift,ʼ OAv. *daʼō*, spelled *då*; Indo–Iran. **pHtar-* ʻfatherʼ > OAv. *ptar-*, OInd. *pitar-*), although a vowel was inserted (or the vocalized laryngeal kept) in initial groups (YAv., OPers. *pitar-*).

Proto-Iranian in turn split into several distinct dialect groups characterized, among other things, by the developments of the palatal affricates *ć, j́* and the groups *ćw* and *j́w*.

Proto-Ir.	SW-Iran.	Central-Iran.	NE-Ir.
**ć, ǰ́*	*θ, d*	*s, z*	*s, z*
**ćw, ǰ́w*	*s (θ), z*	*sp, zb*	*ś, ź*

To the southwestern group belong the Persian languages and the other languages of southwestern and southern Iran (Bakhtiari and Lori, Fars dialects, Larestani, and Bashkardi). To the northeastern group belong Khotanese and Wakhi. All the others belong to the central group. Examples: Indo–Iran. **daća* '10,' OPers. **daθa*, Av. *dasa*, Khot. *dasau*; Indo–Iran. **aǰ́ʰam* 'I,' OPers. *adam*, Av. *azəm*, Khot. *aysu*; Indo–Iran. **aćwa-* 'horse,' OPers. *asa-*, Median, Av. *aspa-*, Khot. *aśśa-*, Wakhi *yīš*; Indo-Iran. **-ijwā(n)-* 'tongue,' OPers. *hizān-*, MPers. *izbān*, Khot. *biśāa-* /βiźāa-/.

Characteristic Features of Morphology and Points of Syntax

Avestan and Old Persian are still of the Indo–European type (like Greek, Old Indic), with complex morphologies.

In the nominal and pronominal systems, Old and Young Avestan have three numbers (singular, dual, plural), eight cases (nominative, accusative, genitive, dative, instrumental, ablative, locative, vocative); in Old Avestan, the ablative singular has a distinct ending only in the *a*-declension (*-āt̰*), while in Young Avestan, the final *-t̰* is found in all declensions. Old Persian has only six cases and was also losing dual forms.

The Avestan verbal system is based on three stems: present, aorist, and perfect (e.g., *kar-* 'to do': PRES *kərənao-*, AOR *kar-/car-*, PERF *ca-kar-*). All the Indo-Iranian moods are preserved. There is a past participle in *-ta-* (e.g., *kərə-ta-*) and several infinitives. In Old Avestan, the three stems are associated with different aspects: not completed event (present, imperfect, injunctive); completed event (aorist); present result of past event (perfect). In Young Avestan and Old Persian, the aspect system survives mainly in modal forms; in Old Persian, aorist modal forms form a suppletive paradigm with present forms. The Young Avestan present injunctive (present stem with secondary endings) and the Old Persian imperfect (augment plus present stem with secondary endings) became general narrative tense, expressing continuous or punctual actions and events, as well as anteriority, depending on context (YAv. *kərənaom* [*-aom* < *-aw-am*] 'do-1ST.SING,' OPers. *a-kunav-am* 'PAST-do-1ST.SING' = 'I did, (when . . .) I had done.'

An innovation common to Young Avestan and Old Persian is the optative used (with or without augment) to express habitual actions or events in the past (YAv. *apataiiən* < *a-pat-aiy-ant* 'PAST-fall-OPT-3RD.PL' = '(the demons) used to run about'; OPers. *avājanyā* < **ava-a-jan-yā-t* 'down-PAST-strike-OPT-3RD.SING' = 'he used to kill'). This usage continues in several Middle Iranian languages.

Old Persian is in the process of developing a split-ergative verbal system, with an ergativic perfect tense contrasting with the ancient imperfect (*a-kunav-am* 'PAST-*do*-1ST.SING' = 'I did/had done' versus *manā kar-t-am* 'I.GEN-DAT do-PAST.PART-NOM.SING. NEUT' = 'I have done [it]').

The Middle and New Iranian languages exhibit a variety of developments that represent smaller or greater innovations compared with Old Iranian.

Points of Historical Phonology

We may distinguish between languages with conservative phonologies, characterized by the survival of surd stops and affricates after vowels (comparable to Italian in this respect), and languages where these are voiced or dropped (comparable to Spanish and French). Sogdian and Balochi are of the former type, the others at various stages of the latter.

Final syllables are lost to various degrees, e.g., OIran. NOM.SING **aćw-ah* 'horse': Av. *asp-ō*, OPers. *as-a*, Khot. *aśś-ä*, Sogd. *asp-í*, Parth., MPers., NPers. *asp*, Pashto *ās*.

The Indo–Iranian syllabic *r* <r̥> developed differently from *ar* in most languages (Av. <ərə>, OPers. <ar>, MPers. *ir/er, ur*, etc.; e.g., Av. *zərəδaiia-* 'heart,' Parth. *zirδ*, MPers. *dil* [*-rd* > *-l*]; Av. *mərə-ta-* 'dead,' OPers. *mar-ta-*, MPers. *murd*).

All the Old Iranian diphthongs were monophthongized. Fronting and backing of vowels (umlauting) is common in both diachrony and synchrony.

In Chorasmian, Khotanese, and many modern East Iranian languages, the old palatal affricates *č* [tʃ] and *ǰ* [dʒ] became dental affricates *c* [ts] and *j* [dz], while new palatal affricates developed from the velar stops by palatalization.

The groups *xt, ft* became *γt, βt* (with various further developments) in Ossetic and eastern languages (Av. NOM.SING *duxt-a* 'daughter,' Sogd., Chor. *δuγd-á*, Khot. *dūt-a* /δūd-a/, Bactr. <logd-a> = *lugd-a*, Pashto *-lә́* [< **luw* in *tәr-lә́* 'uncle/aunt's daughter']; MPers. *haft* '7,' Sogd. *aβt*, Khot. *hauda*, Pashto *owә́*, Shughni *ūvd*, Wakhi *ɨb*).

Some modern East Iranian languages also have retroflex series, e.g., sibilants *š* [ʃ], *ṣ̌* [ʂ], *ž* [ʒ], *ẓ̌* [ʐ]; affricates *ts, tš, tṣ̌, dz, dž, dẓ̌*, etc. In Pashto, the phonetic realization of the retroflex sibilants defines four dialect areas, going from southwest to northeast: *pašto, paṣ̌to, paxˇto, paxto*.

The development of consonant groups is especially varied:

θr: OPers. *ç*, MPers., etc., *s*; Sogd. (and several mod. dialects) *š*; Khot. *dr-,-r-*; Parth., Bactr. *hr*; Ossetic *rt* (e.g., OIran. NOM.SING **puθr-ah* 'son': OPers. *puç-a*, MPers. *pus*, NPers. *pesar* [changed after *pedar* 'father']; Sogd. *pəš-í*, Khot. *pūr-ä*, Parth. *puhr*, Bactr. <pouro> = *puhr*; Oss. *firt*; OIran. **θrāi̯ah* 'three': MPers. *sē*, NPers. *se*; Sogd. *šē*; Khot. *drai*; Parth. *h(e)ray*, Bactr. <uarēio> = *harēy*, Shughni *aray*; Oss. *ærtæ*, Wakhi *truy*; Munji *x̌iray*).

rs: remains in Ossetic and several eastern languages but commonly becomes *š* in western languages; Pashto and some others have *ṣ̌t* (e.g., **pr̥sa-* 'ask,' Pashto *puṣ̌t-*); the Shughni group has variously *x̌c, ws* (Shughni *pex̌c*, Roshani *paws-*).

rt: frequently remains or becomes *rd* (Wakhi *mərt* 'dead', MPers. *murd*); it becomes retroflex *ṭ* [ʈ] in several eastern languages (e.g., Khot. *muḍa-*), which further becomes retroflex flap *ṛ* [ɽ] (e.g., Pashto *mṛə*), or loses retroflexion and becomes *d* or *g* (Shughni *mūd*, Roshani *mɛwg*).

št: Oss. *st*; Bactr., Pashto *t*; Shughni group *x̌t*; Yidgha-Munji *šk^y*, *šč* (Av. *ašta* 'eight,' OPers. *aštā*, MPers., NPers. *hašt* [with *h-* from *haft* 'seven'], Bactr. <atao> = *ata*, Pashto *atə́*, Shughni *wax̌t*, Yidgha *aščo*).

Points of Historical Morphology and Syntax

Three genders are still found in Sogdian and Khotanese. Two genders are found in Bactrian and Chorasmian and in many modern languages. Persian and many modern languages have no gender.

The dual remains in Sogdian and Chorasmian. The numerative forms used only after numerals in Sogdian and Pashto incorporate old dual forms.

In several Middle and New Iranian languages, marked plural forms are restricted to animate nouns or are used to express individuality.

Definite articles from demonstrative (or relative) pronouns are found in Sogdian, Bactrian, Chorasmian, and Ossetic. In the modern languages, indefiniteness is usually expressed by a suffixed 'one.' Definiteness (topicalization, etc.) is expressed in a variety of ways (which is addressed later, in the section on direct object marking).

The western languages (Middle Persian, Parthian, Bactrian) have reduced the older, six-case system to a two-case system (direct case for the older nominative and accusative[?] and oblique for the other cases), while the eastern languages (Tumshuqese, Khotanese, Sogdian) preserve the Old Persian-type six-case system. In several declensions in Sogdian, in Chorasmian, and in the later stages of Khotanese, the nominative and accusative singular are no longer distinguished (exceptions in the pronouns). Several modern languages preserve the two-case system, sometimes with the addition of one or more local cases. Balochi and other eastern languages have nominative, genitive (possessive), oblique, and a case for the direct/indirect object. Ossetic, to some extent influenced by Caucasian languages, has the largest number of cases, including nominative, genitive, and dative (grammatical cases) and (local cases) allative, ablative, inessive, adessive, equative (expressing language and likeness), and comitative (only Iron).

In Sogdian, a system of light versus heavy stems developed: stems containing at least one long vowel or a diphthong (including *ar, an, am*) attracted the stress, causing loss of short final vowels (e.g., NOM.SING *asp-í* 'horse,' LOC.SING *asp-yá*, versus NOM.SING *mḗθ* 'day,' LOC.SING *mḗθ-ī*; IMPERF.3RD.SING *wan-á* 'did' versus *wḗn* 'saw').

Several Middle and New Iranian languages use affixes to mark the direct object, depending on degree of specificity and definiteness. The most common contrast is unmarked = indefinite versus marked = definite. The markers are of three main types, all older indirect object markers: (1) ending derived from older case ending (usually *-e*, *-i*); (2) from older prepositions meaning 'to' (Manichean Parthian [less commonly Middle Persian] *ō* and Bactrian *abo* from OIran. *abi* 'to([ward])'; Bashkardi *be-* from OIran. *pati* 'to([ward])'); (3) from older prepositions meaning 'from, on account of,' etc. NPers., Balochi *-rā* [from OPers. *rādiy* 'on account of,' MPers. *rāy*, indirect object marker]; Shughni group *a(z)-* [OIran. *hača* 'from']).

In the eastern Middle Iranian languages, as well as in several modern East Iranian languages, the noun has two distinct declensions, one going back to the old vocalic stems, the other to extended *ka*-stems (feminine variously, *kā-, kī-, čī-*, and, analogically, *čā*-stems).

The western languages (Middle Persian, Parthian, Bactrian) continue, to varying extents, the Old Persian use of the relative pronoun as relative particle or *ezafe* (Mid. Pers. *ī*, Parth. *čē*, Bactr. *i-*). In New Persian and related dialects, the use of the ezafe is common. The so-called inverted ezafe found in some languages is the oblique case, e.g., Mazanderani *pēr-e kiya* 'father-OBL house' = 'the father's house.' Possession is of the type 'I have' or 'for me is.'

In verb morphology, innovations include the development of new marked present (continuous) tenses and the restriction of the unmarked old present to, sometimes remarked, modal functions; restructuring of the stem systems into pairs of intransitive-passive and transitive–causative verbs; the restructuring of the past tense systems by the addition of the new

perfect system seen in Old Persian; and, when this becomes the regular past narrative tense, the creation of a new perfect system, using various strategies.

Continuous or progressive tenses are marked already in Sogdian, where a particle meaning 'being' is added to the personal forms (*δār-am-skun* 'hold.PRES-1ST.SING-PROG' = 'I am holding'). In Khotanese, petrified participles meaning 'sitting,' 'standing,' 'going' probably modify the verb in the same sense. In the modern languages, a variety of affixes are found. In Persian and the southwestern dialects, we find prefixes originally meaning 'always' (Class. NPers. *hamē* and *mē-*, NPers. *mī-*; Bakhtiari and Lori *ī-* and *ei-*). The Tati and Caspian dialects use a present participle in **-ende* + copula (e.g., **kun-ende-ī* > *kennī* 'do-PRES.PART-COP.2ND.SING' = 'you are doing, you do'). Several languages use constructions of the type 'be in doing': Gilaki *kār-a āmon dar-a* 'work-CONN come.INF in-COP.3RD.SING' = 'he is coming'; Larestani *a-kerdā-em* 'a-doing I am, I am doing'; NBashk. *a-kerdén-om*, SBashk. *be-kért(én)-īn*; Balochi *raw-ag-ā int* 'a-go-ing he is, he is going'. Some eastern languages use a suffix derived from 'stand' (Yaghnobi *-išt*, e.g., *šáw-om-išt* 'go-1ST.SING-CONT' = 'I am going,' imperf. *a-šáw-i-m-išt* 'PAST-go-IMPERF-1ST.SING.CONT' = 'I was going').

The old present acquires modal functions and can be marked (e.g., NPers. subjunctive *kon-am* 'do-1ST.SING' or *be-kon-am* 'SUBJ.do-1ST.SING' = 'I may do').

The imperfect is still characterized by the augment in Middle Persian (only example *a-ger-īy* 'PAST.do-PASS.3RD.SING' = 'was made,' cf. OPers. *a-kar-iya*), Chorasmian, Sogdian, and Tumshuqese (*a-cchu* 'I went'), and in modern Yaghnobi (*a-kún-i-m* 'PAST-do-IMPERF-1ST.SING' = 'I did'). In Chorasmian and Sogdian, the augment is lost in verbs without original prefix; in verbs with prefix, the augment appears as lengthening of the vowel of the original prefix (e.g., Sogd. *θβar-*, IMPERF *θ-ā-βar-*, Chor. *haβir-*, IMPERF *h-ā-βir-* 'gave,' cf. OPers. *frā-bara* < *fra-a-bara* 'forth-PAST-carry-3RD.SING' = 'he gave') or as *m-* (e.g., Sogd. *m-anγaz-* 'began', Chor. *m-ikk-* 'did', analogically from forms with prefix *ham-*, cf. OPers. *ham-a-taxša-iy* 'PREV-PAST-labor-1ST.SING.MID' = 'I labored'). Several modern languages and dialects have imperfects with a suffix *-i-*, which may continue the Old Iranian preterital optative (e.g., Yaghnobi IMPERF *a-šáw-i-m* 'I was going,' PRES.SUBJ *šáw-om* '(that) I go').

In Middle Persian, Parthian, and Bactrian, the (narrative) past tense system (completed action) is based on the older split ergative seen emerging in Old Persian; Sogdian and Choresmian instead use the auxiliary 'to have' in transitive constructions and 'to be' in intransitive ones (Sogd. *əκ^r-t-u-δār-am* 'do.PAST-ACC.NEUT.SING-have.PRES-1ST.SING' = 'I did, I have done'); and Khotanese has a form with an originally active (possessive) participle plus 'to be' (*dä-t-aimä* 'see-PAST-1ST.SING.MASC' = 'I saw, I have seen' < **dīta' āh ahmi* 'having-seen I am'). As the old original perfect replaced the inherited imperfect (injunctive) as past narrative tense, new strategies were invented to express the perfect. The most common is the use of a past stem extended by *-ag* > *-e*, etc. (NPers. *kárd-am* 'I did', *kard-é-am* 'I have done') or *-ss-* (from the older 'stand'; Larestani *če-d-e* 'go-PAST-PERF.3RD.SING' = 'he has gone,' but *če-ss-em* [*-d-s-* > *-ss-*] 'go-PAST.PERF-1ST.SING' = 'I have gone,' Kumzari *zur-s-e* [*zur-* < *zat-*] 'he has struck').

Punctual aspect is often marked by the prefix *b-* or similar, which also marks modal functions in many modern Iranian languages.

The old modal forms were generally preserved in Middle Iranian: subjunctive, optative, and imperative everywhere; the injunctive (with various modal functions) in Chorasmian, Sogdian, and Khotanese. In the modern languages, old modal forms survive as archaisms (NPers. *zende b-ād* 'alive be.3RD.SING.SUBJ' = 'long live!'), and, instead, modal functions are left unmarked in contrast to the marked present (continuous) or are marked by a prefix, often *b-*.

Directional prefixes are common, more or less closely connected with the verb. For instance, the Late Khotanese adverbs *vā*, *ttā*, *hā* and the Pashto prefixes *rā*, *dər*, *wər* indicate the direction of the action or movement toward first, second, or third person and can also simply substitute for the personal pronouns. Ossetic has a complex system of spatial prefixes indicating the direction of the motion relative to location and speaker.

Iraq: Language Situation

B Mahmoodi-Bakhtiari, Center for the Great Islamic Encyclopedia, Tehran, Iran

The Republic of Iraq is home to a variety of different ethnic groups who speak different languages. Of the total 25 374 691 population (2004 census), it is estimated that 75 to 80% of the people are Arabs; 15 to 20% are Kurds; and the remainder, about 5%, is made up of Turkmans, Assyrians, Armenians, and other relatively small groups.

Arabic is the official language of Iraq and is regarded as the mother tongue of more than three-quarters of the population. The written language is a modified version of Classical Arabic, but a diverse set of spoken varieties of Arabic are used. Different dialects of Arabic spoken in Iraq include Mesopotamian Arabic (with almost 12 million speakers), with the alternate names Iraqi Arabic or Furati; North Mesopotamian Arabic, also known as Syro-Mesopotamian Vernacular Arabic, Moslawi, or Mesopotamian Qeltu Arabic; Gulf Arabic, also known as Khaliji, with the dialect Zubair Faau; Judeo-Iraqi Arabic, a greatly endangered dialect, also known as Iraqi Judeo Arabic, Baghdadi Arabic, or Yahudic; and Najdi Arabic, spoken in the south between the rivers up to the Syrian border, with the dialects North and Central Najdi.

Generally, there are two broad groups of spoken Arabic: (a) The spoken Arabic of the Muslims of central and southern Iraq, which can be divided into two subgroups: urban and rural/nomadic. It resembles Gulf Arabic. The Muslim Arabic dialect of Baghdad belongs to this group, and acts as a lingua franca. (b) The spoken Arabic of non-Muslim Arabs, as well as of Muslim Arabs in the north, notably in the province of Mosul. This dialect has marked similarities with some Syrian sedentary dialects.

Iranian languages are the second most commonly used in Iraq. Both Northwestern and Southwestern Iranian languages are used. Among these languages, Kurdish [Kurdi] has the largest community. Kurds have a standard written language and several dialects such as Bajelani, Mukri, Garrusi, Sulaymani, Kolya'I, Zangana, Kermanshahi, Surchi, Herki, and Kurmanji or Northern Kurdish, with the dialects Hakari and Jezire. Other important languages of this group are Gurani, also known as Hawrami or Hawramani, and Zaza [Dimili]. Among the Southwestern Iranian languages, the best known are Lori [Luri] (with the dialects Feyli, Laki, and Bakhtiari), and Persian, which is often spoken along the Iraq-Iran border, and in some Shi'ite holy cities.

Iraq is also interesting for the Aramaic languages spoken in it. The dialects of Neo-Aramaic are spoken in some Christian villages in the north, as well as in central Iraq. Some important members of the Aramaic language family in Iraq are Assyrian Neo-Aramaic or Neo-Syriac, used by the Assyrians, who constitute less than 1 percent of the population and live mainly in the major cities and in the rural areas of northeastern Iraq. Koy Sanjaq Surat is an Aramaic language with 800 to 1000 speakers in the Northern Iraqi town of Koi-Sanjaq and the nearby village of Armota. Chaldean Neo-Aramaic has 100 000 to 120 000 speakers as of 1994.

Iraq, especially its northern part, has been home to diverse linguistic minorities, some of whom were there long before the Arab influx. Technically speaking, Iraq hosts members of Altaic, North Caucasian, and Gypsy languages, in addition to those already noted. The most important Caucasian languages spoken in Iraq are Adyghe (also known as West Circassian or Adygey) and Armenian. Armenian, with about 60 000 speakers, is spoken by an urban community of Armenian descent concentrated in the larger cities.

Of the Altaic group, Azerbaijani and Turkman [Turkmen] are noteworthy. Azerbaijani is spoken mainly in the cities of Kirkuk, Arbil, and Rowanduz, as well as in towns and villages in the southeast from Kirkuk as far as Al Miqdadiyah, Khanaqin, and Mandali, and in several places in the Mosul region. The Turkomans are believed to constitute somewhat less than 2% of the population, and live along the border between the Kurdish and Arab regions. A number of Turkomans also live in the city of Irbil.

Of the minor languages used in Iraq, we should also mention Mandaic, used by the Mandaian people living by the Iranian border with Iraq, and some in Khuzestan province in Iran. The total number of Mandaic speakers is not known. They have a standard written language, though most are fluent in Arabic and Persian.

The only known Gypsy language spoken in Iraq is Domari, with 50 000 speakers as of 1970. This language is also known as Middle Eastern Romani. Nearly all minority language speakers are bilingual in their mother tongue and Arabic.

This article is reproduced from the previous edition, volume 4, p. 1775, © 1994, Elsevier Ltd.

English and Irish are used in the Republic of Ireland, with English the first language of perhaps 96% of the population, all literate. A dialect of Scots, with no official status, is used by several thousand in a northern county. Irish was adopted as one of the symbols of national identity following independence from the United Kingdom, and a policy of language revival has been pursued mainly through the education system, where Irish is taught to all pupils throughout their schooling.

Although this has succeeded in encouraging large numbers to learn the language, little progress has been made in the area of language use. Irish is returned in census reports as known by over one million, about 30% of the population, but because of self-reporting it is difficult to establish real levels of fluency and literacy. Native speakers of Irish have been recently estimated at around 2%, perhaps 60 000 in all, with about 10 000 living in viable language communities in two western countries. In addition, there are families in English-speaking areas where both parents are fluent Irish learners and where Irish is the everyday language. There are no estimates of the numbers of such families, but a figure of around 2% of the population would not be unreasonable. All Irish speakers are bilingual in English, and code switching is common among native speakers of Irish but not between fluent Irish learners. The Constitution recognizes two official languages, Irish, 'the first,' and English, but there is no statutory provision to formalize their relative status. Most Parliamentary business is transacted through English, with all Acts and most official forms being available in both languages. The main language of the media is English, with an Irish language radio channel. Instruction in most schools and in higher education is through English, but there are a number of Irish-medium schools, both primary and secondary. French, German, Spanish, and Italian are taught as foreign languages in secondary schools.

Irish Lexicography

D P Ó Baoill, Queen's University, Belfast, UK

The first Irish dictionaries were compiled more than a thousand years ago. They consisted mostly of word lists and glosses. It is difficult to evaluate these glossaries until further detailed study of them has been completed.

Very little has been written about the history of Modern Irish (Irish Gaelic) lexicography, and criticism of published dictionaries is seldom based on scientific principles of lexicography. Almost all the main dictionaries are bilingual and are for the most part directed at learners of Irish. This is to be expected, since less than 5% of the population acquire Irish as a first language. Use of these dictionaries depends

Irish Lexicography

D P Ó Baoill, Queen's University, Belfast, UK

The first Irish dictionaries were compiled more than a thousand years ago. They consisted mostly of word lists and glosses. It is difficult to evaluate these glossaries until further detailed study of them has been completed.

Very little has been written about the history of Modern Irish (Irish Gaelic) lexicography, and criticism of published dictionaries is seldom based on scientific principles of lexicography. Almost all the main dictionaries are bilingual and are for the most part directed at learners of Irish. This is to be expected, since less than 5% of the population acquire Irish as a first language. Use of these dictionaries depends

mostly on the purpose for which they were compiled: to inform native speakers of Irish or to instruct native English speakers. The four main dictionaries dealing with modern Irish usage were all published in the 20th century, namely, Fr. Patrick Dinneen's *Irish-English dictionary* (1927), Fr. L. McKenna's *English-Irish dictionary* (1935), Tomás de Bhaldraithe's *English-Irish dictionary* (1959), and Niall Ó Dónaill's *Irish-English dictionary* (1977).

Irish speakers owe the greatest debt to Dineen's work (1927). Its success and popularity has been fostered over generations, as it was the dictionary used to teach Modern Irish to several generations of Irish speakers and learners. It helped standardize Irish grammar and idiom and regulate spelling conventions. De Bhaldraithe's dictionary (1959) was the first to include the new formulated standard spelling and grammar, published in 1958 under the title *Graiméar na Gaeilge: an caighdeán oifigiúil*. All subsequent publications and dictionaries have been written using this standard or some slightly emended form.

The 1959 and 1977 dictionaries were compiled in the Department of Education. Due to the many cultural and linguistic changes undergone by both the Irish and English languages, vocabularies in both languages have undergone and are undergoing major changes. There is, therefore, a need for continuous updating and review.

The *Dictionary of the Irish language*, which was based mainly on Old Irish (600–900 A.D.) and Middle Irish (900–1200 A.D.) materials, was published over a 150-year period, the last fascicle appearing in 1976. A decision was then taken to continue with a similar lexicographical project on Modern Irish, covering the period 1600–1900. This was indeed an urgent necessity. The aim was to produce a monolingual historical dictionary, using the standard modern forms as headwords. A decision was taken in 1984 that the dictionary should appear in the form of fascicles, and the drafting of letter *A* began. Tomás de Bhaldraithe resigned his post as Chief Editor in 1994. Subsequently, a review of the procedures being implemented by the dictionary staff concluded that its objectives needed to be redefined. For the next decade or so, the main objective was to produce a computerized dictionary archive for Modern Irish. This work has now been made available electronically (2004). The work on the dictionary itself remains incomplete.

Phase 2 of the new English-Irish dictionary is due to begin in 2005. It is expected that it will take three to five years to complete. The dictionary will contain some 70 000 headwords and will be corpus-based. The Irish language component in the dictionary will include the three principal varieties spoken in Ireland. The English language in the dictionary will be the language of Ireland, both Northern Ireland and the Republic. While foregrounding Irish English, it will also include standard British and American English and well-known words and phrases from other varieties. An electronic version of the dictionary will also be made available.

Irony

S Attardo, Youngstown State University, Youngstown, OH, USA

The term 'irony' is commonly used to describe both a linguistic phenomenon (verbal irony) and other phenomena including 'situational' irony (i.e., irony of facts and things dissociated from their linguistic expression; Shelley, 2001) such as a fire-station burning to the ground, various more-or-less philosophical ideas (Socratic irony, Romantic irony, Postmodern irony), and even a type of religious experience (Kierkegaard, 1966). While there may be connections between situational and verbal irony, it does not appear that literary and religious uses can be fruitfully explained in terms of linguistic irony. This treatment will be limited to verbal irony.

Other definitional problems include the purported distinction between irony and sarcasm. While some have argued that the two can be distinguished (for example, irony can be involuntary, while sarcasm cannot be so), others maintain that no clear boundary exists. A further problem is presented by the fact that in some varieties of English, the term *irony* is undergoing semantic change and is assuming the meaning of an unpleasant surprise, while the semantic space previously occupied by *irony* is taken up by the term *sarcasm*.

The word *irony* goes back to the Greek *eironeia* (pretense, dissimulation) as does the history of its definition and analysis. Irony is seen as a trope (i.e., a figure of speech) in ancient rhetorics and this analysis has remained essentially unchallenged until recently. In the traditional definition irony is seen as saying something to mean the opposite of what is said. This definition is demonstrably incorrect, as a speaker may be ironical but not mean the opposite of what he/she says; cf. *It seems to be a little windy* (uttered in the middle of a violent storm), in which the speaker is saying less than what is meant. Similarly, overstatements and hyperbole may be ironical (Kreuz and Roberts, 1995).

A recent and fruitful restatement of the irony-as-trope theory has been presented by Paul Grice who sees irony as an implicature, i.e., as a deliberate flouting of one of the maxims of the principle of cooperation. Relatedly, speech-act approaches to irony see it as an insincere speech act. Initially, Grice's approach saw irony as a violation of the maxim of quality (i.e., the statement of an untruth) but this claim has been refuted, as seen above. Broadening the definition to, for example, 'saying something while meaning something else,' runs the risk of obliterating the difference between irony and other forms of figurative or indirect speech. However, this loss of distinction may be a positive aspect of the definition, as has been recently argued (Kreuz, 2000, Attardo, 2002).

While the idea of 'oppositeness' in irony is problematic, approaches to irony as negation have been presented (Giora, 1995), who sees irony as 'indirect' (i.e., inexplicit; cf. Utsumi, 2000) negation; related ideas are that of contrast (Colston, 2002) and inappropriateness (Attardo, 2000).

A very influential approach to irony is the mention theory (Sperber and Wilson, 1981), which claims that an utterance is ironical if it is recognized as the echoic mention of another utterance by a more or less clearly identified other speaker. Furthermore, the ironical statement must be critical of the echoed utterance (cf. Grice, 1989: 53–54). Similar theories based on the ideas of 'pretense' and 'reminder' have been presented as well. Criticism of the mention theory notes that not all irony seems to be interpretable as the echo of someone's words, or that if the definition of mention is allowed to encompass any possible mention it becomes vacuous (since any sentence is potentially the mention of another sentence). Furthermore, there exists an admittedly rarer, non-negative, praising irony, called *asteism* (Fontanier, 1968: 150). An example of asteism might be a colleague describing Chomsky's *Aspects of the theory of syntax* as a 'moderately influential' book in linguistics. Other approaches to irony include the 'tinge' theory, which sees irony as blending the two meanings (the stated and the implied ones) with the effect of attenuating the ironical one (Colston, 1997).

All the theories of irony mentioned so far share the idea that the processing of irony is a two-step process in which one sense (usually assumed to be the literal meaning) of the utterance is accessed and then a second sense of the utterance is discovered (usually under contextual pressure). Thus, for example, in a Gricean account of irony as implicature, the hearer of an utterance such as *That was smart* (uttered as a description of clumsy behavior, such as spilling one's wine upon someone's clothing) will first process the utterance as meaning literally roughly 'This behavior was consonant with how smart people behave' and then will discard this interpretation in favor of the implicature that the speaker means that the behavior was *not* consonant with how smart people behave. This account has been challenged recently by 'direct access' theories.

The direct access theories claim that the hearer does not process the literal meaning of an ironical

utterance first and only later accesses the figurative (ironical) meaning. Rather, they claim that the literal meaning is either not accessed at all or only later. Direct access interpretations of irony are squarely at odds with the traditional interpretation of irony as an implicature. Some results in psycholinguistics have been seen as supporting this view (Gibbs, 1994). The mention theory of irony was commonly interpreted as a direct access theory, but recent work (Yus, 2003) seems to indicate that it too can be interpreted as a two-step process. Other researchers (e.g., Dews and Winner, 1999) have presented contrasting views which support the two-step approach, although not always the claim that the literal meaning is processed first: claims that interpretations are accessed in order of saliency (Giora, 2003) or in parallel have been put forth.

Psycholinguistic studies of irony have focused on children's acquisition of irony (Winner, 1988), progressively lowering the age at which children understand irony to under ten years old; on the neurobiology of the processing of irony (McDonald, 2000), emphasizing the role of the right hemisphere alongside the left one (in which most language processing takes place); and on the order of activation of the various meanings in the ironical text. A significant issue is the degree and nature of the assumptions that the hearer and speaker must share for irony to be understood; this can be summed up as the 'theory of mind' that the speakers have. In particular, irony involves metarepresentations (Bara *et al.*, 1997, Curcó, 2000).

Considerable attention has been paid to the optional markers of irony, i.e., primarily intonational and kinesic indications of the speaker's ironical intent. While several phonological and other features have been considered 'markers' of irony, it appears that none of these features is exclusively a marker of irony. Reviews of markers include phonological (e.g., intonation), graphic (e.g., italics, punctuation), morphological (e.g., quotatives), kinesic (e.g., winking), and contextual clues (Haiman, 1998).

Recently, the social and situational context of irony as well as its pragmatic ends have begun being investigated in sociolinguistics and discourse/conversation analysis as well as in psycholinguistics. Work on the social functions of irony has found a broad range of functions, including in- and out-group definition, evaluation, aggression, politeness, verbal play, and many others (e.g., Clift, 1999; Anolli *et al.*, 2002; Gibbs and Colston, 2002; Kotthoff, 2003). It is likely that this list may be open-ended.

The relationship between irony and humor remains underexplored, despite their obvious connections, although some studies are beginning to address the interplay of irony and other forms of implicature, such as indirectness, and metaphoricity. Finally, it is worth noting that dialogic approaches to language (e.g., Ducrot, 1984) see irony as a prime example of the co-presence of different 'voices' in the text (*see* **Literary Pragmatics**), in ways that avoid the technical problems highlighted in the mention theories.

Irony: Stylistic Approaches

J Boutonnet, University of Wolverhampton, Wolverhampton, UK

Most books or articles on the topic start with a warning that the concept of irony is elusive (Muecke, 1970) and that it takes many forms. Myers (1981: 410) said that "in irony we inherit both a device and a concept." Nash (1985) alerted us to the lack of consistency in usage even among literary critics. Although dictionaries offer definitions and exemplifications, they point to the complexity of the phenomenon rather than enlighten the reader. The word has both positive and negative connotations today, a mark of its complex history and range of functions in discourse. The word does not appear in the English language until the 16th century and is only commonly used by speakers from the early 18th century onwards. Clearly the phenomenon existed before it was named, even prior to the Greek word from which the English word derives. The word *eironeia* to describe the Greek philosopher Socrates's treatment of his conversational opponents is first recorded in Plato's *Republic*. Socratic irony today refers to a discourse strategy whereby the speaker pretends he or she is learning from an interlocutor whilst trying all the while to uncover the flaws in that person's argument (Nilsen and Nilsen, 2000).

Conveniently, a distinction is often made between situational irony and verbal irony. In the first we have an observer who notices a state of affairs or event which is in some way incongruous. The second is a rhetorical device. We have an ironist who produces a linguistic message whose meaning is other than the literal meaning, in many cases understood to be the opposite of the literal meaning conveyed. There is a discrepancy between the words and what the speaker means by these words, an opposition between the surface and the underlying meaning. This is also called traditional irony in most writings and is often attributed to Aristotle (Barbe, 1995).

An oppositional model of verbal irony holds that the speaker says the opposite of what he or she means. In this account, irony is unveiled by a process of substitution of lexical items or propositions. In the case of stable irony (Booth, 1974), where the intended meaning is fairly clear, as in "What a lovely day!" uttered on a day when the weather is anything but pleasant, meaning may be retrieved by word substitution (e.g., 'lovely' for 'awful'), an example of lexical-antonymy. Oppositeness is at the heart of Raskin's semantic theory of humor (STH) (Raskin, 1985) where he discussed oppositeness in terms of local antonymy, two opposite meanings arising from a particular discourse. At the propositional level, consider Myers's (1981: 411) example "I always wanted to spend the summer in Detroit," uttered by a speaker who does not want to spend the summer in Detroit. Here we have an example of negation at the propositional level. Some linguists argue that examples like the one above constitute an instance of criticism coupled with a complaint, also known as nonce irony. Common irony refers to expressions which have become stock phrases in a language, such as "that's a likely story!" (Barbe, 1995: 18–22).

When considering verbal irony, a number of assumptions need clarification. One often-debated issue is that of intentionality and sincerity of the

Irony: Stylistic Approaches

J Boutonnet, University of Wolverhampton, Wolverhampton, UK

Most books or articles on the topic start with a warning that the concept of irony is elusive (Muecke, 1970) and that it takes many forms. Myers (1981: 410) said that "in irony we inherit both a device and a concept." Nash (1985) alerted us to the lack of consistency in usage even among literary critics. Although dictionaries offer definitions and exemplifications, they point to the complexity of the phenomenon rather than enlighten the reader. The word has both positive and negative connotations today, a mark of its complex history and range of functions in discourse. The word does not appear in the English language until the 16th century and is only commonly used by speakers from the early 18th century onwards. Clearly the phenomenon existed before it was named, even prior to the Greek word from which the English word derives. The word *eironeia* to describe the Greek philosopher Socrates's treatment of his conversational opponents is first recorded in Plato's *Republic*. Socratic irony today refers to a discourse strategy whereby the speaker pretends he or she is learning from an interlocutor whilst trying all the while to uncover the flaws in that person's argument (Nilsen and Nilsen, 2000).

Conveniently, a distinction is often made between situational irony and verbal irony. In the first we have an observer who notices a state of affairs or event which is in some way incongruous. The second is a rhetorical device. We have an ironist who produces a linguistic message whose meaning is other than the literal meaning, in many cases understood to be the opposite of the literal meaning conveyed. There is a discrepancy between the words and what the speaker means by these words, an opposition between the surface and the underlying meaning. This is also called traditional irony in most writings and is often attributed to Aristotle (Barbe, 1995).

An oppositional model of verbal irony holds that the speaker says the opposite of what he or she means. In this account, irony is unveiled by a process of substitution of lexical items or propositions. In the case of stable irony (Booth, 1974), where the intended meaning is fairly clear, as in "What a lovely day!" uttered on a day when the weather is anything but pleasant, meaning may be retrieved by word substitution (e.g., 'lovely' for 'awful'), an example of lexical-antonymy. Oppositeness is at the heart of Raskin's semantic theory of humor (STH) (Raskin, 1985) where he discussed oppositeness in terms of local antonymy, two opposite meanings arising from a particular discourse. At the propositional level, consider Myers's (1981: 411) example "I always wanted to spend the summer in Detroit," uttered by a speaker who does not want to spend the summer in Detroit. Here we have an example of negation at the propositional level. Some linguists argue that examples like the one above constitute an instance of criticism coupled with a complaint, also known as nonce irony. Common irony refers to expressions which have become stock phrases in a language, such as "that's a likely story!" (Barbe, 1995: 18–22).

When considering verbal irony, a number of assumptions need clarification. One often-debated issue is that of intentionality and sincerity of the

ironist. Here the focus is on the production of an ironic text. This approach has been popular in stylistic analyses of literary texts, concerned with identifying devices employed by writers. The rhetorician Quintilian claimed that the ironist 'intends' to convey something which is other than what he or she says, thus effectively being insincere. Albeit not universally held, this view still finds many supporters today. Interestingly, the anti-intentionalist position is refuted on the basis that if the text can be read ironically, it is read "as if it were intended to be ironical" (Muecke, 1978: 364), highlighting the importance of the speech community's conventions of usage over the individual speaker's intentions. However, Gibbs *et al.* (1995) provided convincing evidence that intention is not necessary for irony to occur. They show that hearers are perfectly able to recognize the ironic meaning created by a sentence whilst knowing at the same time that the speaker's intention was not to convey irony. It is true that instances of dramatic irony rely on this, as is the case when readers of a book, or an audience at a play, know something that the characters themselves do not know. In the world of theatre, the *ingénu* who utters sincerely the words of the playwright is a good example of unintentional irony. The speaker is separate from the ironist, the animator of the utterance distinct from the author of the utterance (Goffman, 1979).

Haiman (1990: 188) explained that the distinction between sarcasm and irony is rooted in intention. Whilst sarcasm is intentional, it is not a necessary condition for irony. "To be ironic, a speaker need not be aware that his words are 'false' – it is sufficient that his interlocutors or his audience be aware of this." Sarcasm is often categorized as a form of irony and some researchers use the term interchangeably (Attardo *et al.*, 2003). However, for some, it is a type of indirect criticism which is perhaps more personal and more blunt, and where the speaker's intentions to criticize are more obvious. Barbe (1995: 28) distinguished between the two by considering whose face is more threatened by the utterance. In the case of sarcasm she claims the speaker is compromising him- or herself, and thus a sarcastic comment constitutes a face-threatening act for the speaker.

As for the notion of double significance, and more precisely the clash between the literal and implied meaning, it is clear that the meanings are not necessarily in a relation of 'opposition' in the strict sense, as is often presumed. When making use of hyperbole it is possible to speak the truth whilst conveying an additional meaning. Myers's example of the comment "I love people who signal," uttered by a passenger after the driver attempts a left turn without signaling (Myers, 1977: 172), is a good case in point. Here the speaker is not saying she does not like people who signal, a negation of the declaration, neither is she being sincere about loving all people who signal. As well as exaggeration, understatement may be used ironically, effectively flouting Grice's maxim of quantity – which suggests that your contribution must be as informative as is required, but no more than is required, for the purposes of the current exchange (Levinson, 1983). The ironist is speaking the truth, but implies, by omitting to give as much information as is required, that there is a conversational implicature to be inferred by the hearer (*see* **Maxims and Flouting**). Ironical quotations and interjections do not fit into the traditional oppositional model of irony either.

Irony can make use of metaphors (*see* **Metaphor: Stylistic Approaches**). Overusing metaphors, placing unfitting metaphors, and juxtaposing unlikely metaphors are useful devices for the production of irony. In the case of explicit irony (as in a sentence starting with, for example, 'ironically' or 'isn't it ironic') the speaker brings to the recipient's attention an incongruous occurrence, communicating the nonverbal irony of fate. But in most instances of irony, which are implicit, inference is the key to uncovering the 'true' meaning. However, as with all instances of irony, interpretation is idiosyncratic and it is not certain that meaning will be recovered by the hearer. This has led many researchers to shift their focus away from the ironist to the recipient of the message (*see* **Irony**) (Kaufer, 1981; Giora, 1995; Giora and O'Fein, 1999a, 1999b).

Building on Sperber and Wilson's echoic interpretation model (Sperber and Wilson, 1981; Wilson and Sperber, 1992) and the pretense and theater models (Clark and Gerrig, 1984; Haiman, 1990), Clift (1999) concluded that in naturally occurring conversations, irony is not necessarily located in the utterance itself, thus giving credence to the view that irony cannot reliably be identified on the basis of linguistic description alone. Irony emerges from dynamic conversational activity and is exploited by creative speakers as part of their turn-taking involvement. For Clift, irony may emerge from a flouting of a conversational expectation, a tension between 'slots' and the 'items' that fill them (Clift, 1999: 547). Irony in natural conversation serves an important discourse and social goal and is used in the management of interpersonal relationships (Norrick, 1993). It can be used to criticize whilst not losing face and at the same time minimize the threat to the face of the listener, thus adhering to rules of politeness. It can be used to display wit and solidarity and to affirm bonds between conversationalists too (affiliative vs. nonaffiliative purposes).

In pragmatics it is postulated that recognition of irony lies in the markers used to direct the recipient of the message to the right interpretation. Contextual clues can appear at all levels of language: word, clause, utterance, and discourse. In speech, pointers include kinesic (ranging from gestures to nods and smiles) and phonic (tone of voice, stress, pitch, etc.) markers. Another pointer to irony may come from the contribution being inappropriate in relation to the context or the cotext, even when on the surface the contribution seems relevant. Contradictory clauses are also a trigger. One indicator is the use of register clashes. During an informal conversation one might shift from an informal style to a formal style for ironic effect, for example, or insert phraseology which belongs to another field of discourse. An unusual collocation may alert the speaker (or reader) to the existence of an ambiguity. Jane Austen's opening sentence in *Pride and Prejudice*,

> "It is a truth universally acknowledged that a single man in possession of a good fortune must be in want of a wife,"

combines overstatement ('universally,' 'must be') with a contradiction ('good fortune' / 'in want of') to indicate that the sentence must not be taken at face value. The choice of lexis points to an incongruity and alerts the reader to another intended meaning. Markers, however, are pointers and do not constitute irony *per se*.

Although verbal irony does not always imply a script opposition or negation of the literal message, it allows for a double perspective to be conveyed. This may explain why much irony falls into the realm of humor (*see* **Humor in Language**), as the perception of a contrast is at the heart of Incongruity Theories and Surprise Theories (Goldstein and McGhee, 1972). Attardo (1994) placed the word 'irony' within the semantic field of humor, and claimed that irony and humor overlap significantly (Attardo, 2001). Others have argued that irony and humor share the same mechanisms (Giora, 1995). Irony is used to express an evaluative judgment, to convey an attitude about the interlocutor, an event, or more generally about some aspect of one's universe of belief (Martin, 1992) with the possible outcome that it can have the perlocutionary effect of being humorous, a desirable quality for most. For the recipient, satisfaction is gained from the process of decoding the multiple readings. In literature, techniques used by writers which signal that humor is present also enhance the reader's experience. Triezenberg (2004) explained that, for example, as a device, repetition with skillful variation is a potent humor enhancer. She also drew attention to the importance of cultural factors and shared background knowledge for ensuring that humor is decoded and fully appreciated. In order to achieve a "secret communion" (Leech and Short, 1981) between author and reader, a complex range of linguistic and nonlinguistic factors needs to be combined.

The general theory of verbal humor (*see* **Humor: Stylistic Approaches**) was developed to describe the conditions necessary for a short text to be considered humorous, and aims to provide an explanation of the cognitive processes involved in the processing of humorous texts (Attardo, 2001, 2002). From considering the structure of the joke, the theory has been extended to attempt to analyze humorous literary texts. Although some attest to its literary stylistics value, others argue that it is hitherto not adequate to account for the aesthetic qualities of literary writing (Triezenberg, 2004). Nevertheless, irony as well as humor is a linguistic resource which speakers and writers employ skillfully and acquire as part of their linguistic competence, and recognize in others' performance. No absolute agreement can ever be reached about incidences of irony and their interpretation, as usage as well as interpretations are rooted in the social and linguistic conventions of a particular speech community at a specific point in time. To the extent that any instance of language use can be analyzed using rigorous methods of linguistic and stylistic analysis, it is possible to say something about the mechanisms employed in the use of irony, even if the concept itself is constantly evolving.

Iroquoian Languages

M Mithun, University of California, Santa Barbara, CA, USA

The Iroquoian Family

The Iroquoian languages are indigenous to southeastern and northeastern North America. The family consists of two major branches: Southern Iroquoian and Northern Iroquoian.

Southern Iroquoian is represented by just one language, Cherokee, spoken today primarily in Oklahoma and western North Carolina. There are clear dialect differences between western and eastern Cherokee and within each, many of which predate the forced marched of the Cherokee from North Carolina to Oklahoma in 1838.

Northern Iroquoian consists of several subgroups. The first to break away from the main branch developed into Tuscarora, Nottoway, and Meherrin. The Tuscarora were first encountered in eastern North Carolina, but early in the 18th century most moved north to rejoin other Northern Iroquoians. Their descendants now live primarily in two communities, one at Six Nations on the Grand River in Ontario, the other near Niagara Falls in New York State. Nottoway and Meherrin were once spoken near the Virginia and North Carolina coasts. All that remains of Nottoway are two wordlists recorded during the early 19th century. The only record of Meherrin is two town names, sufficient to identify the language as Iroquoian. The Meherrin merged with those Tuscarora who did not migrate north in the 18th century.

The next group to separate from Northern Iroquoian became the Huron. They comprised a confederacy of four nations totaling around 20 000 people when they encountered Champlain in 1615 in present southern Ontario. In 1649, they were decimated by the Five Nations Iroquois. Some survivors formed a settlement at Lorette near modern Quebec City. Others joined the remnants of neighboring Iroquoian nations, the Tionontati (Petun), Erie, and Neutral, and migrated west toward Detroit and ultimately into Oklahoma. This group became known as the Wyandot. Both Huron proper at Lorette and Wyandot in Oklahoma were last spoken in the 20th century.

The remaining Northern Iroquoians separated into several subgroups, whose territories extended across present New York State. These were the Five Nations (with Tuscarora, the Six Nations), members of the League of the Iroquois. To the west were the Seneca and Cayuga. In the center were the Onondaga, near

Iroquoian Languages

M Mithun, University of California, Santa Barbara, CA, USA

The Iroquoian Family

The Iroquoian languages are indigenous to southeastern and northeastern North America. The family consists of two major branches: Southern Iroquoian and Northern Iroquoian.

Southern Iroquoian is represented by just one language, Cherokee, spoken today primarily in Oklahoma and western North Carolina. There are clear dialect differences between western and eastern Cherokee and within each, many of which predate the forced marched of the Cherokee from North Carolina to Oklahoma in 1838.

Northern Iroquoian consists of several subgroups. The first to break away from the main branch developed into Tuscarora, Nottoway, and Meherrin. The Tuscarora were first encountered in eastern North Carolina, but early in the 18th century most moved north to rejoin other Northern Iroquoians. Their descendants now live primarily in two communities, one at Six Nations on the Grand River in Ontario, the other near Niagara Falls in New York State. Nottoway and Meherrin were once spoken near the Virginia and North Carolina coasts. All that remains of Nottoway are two wordlists recorded during the early 19th century. The only record of Meherrin is two town names, sufficient to identify the language as Iroquoian. The Meherrin merged with those Tuscarora who did not migrate north in the 18th century.

The next group to separate from Northern Iroquoian became the Huron. They comprised a confederacy of four nations totaling around 20 000 people when they encountered Champlain in 1615 in present southern Ontario. In 1649, they were decimated by the Five Nations Iroquois. Some survivors formed a settlement at Lorette near modern Quebec City. Others joined the remnants of neighboring Iroquoian nations, the Tionontati (Petun), Erie, and Neutral, and migrated west toward Detroit and ultimately into Oklahoma. This group became known as the Wyandot. Both Huron proper at Lorette and Wyandot in Oklahoma were last spoken in the 20th century.

The remaining Northern Iroquoians separated into several subgroups, whose territories extended across present New York State. These were the Five Nations (with Tuscarora, the Six Nations), members of the League of the Iroquois. To the west were the Seneca and Cayuga. In the center were the Onondaga, near

modern Syracuse. To the east were the Oneida and the Mohawk. The languages are now mutually unintelligible, though they share many structural features. Seneca is now spoken in three communities in western New York: Cattaraugus, Allegany, and Tonawanda. Most Cayuga left New York State after the Revolutionary War, some going to Six Nations in Ontario, and others to Oklahoma. The language is now spoken primarily at Six Nations. It was last spoken in Oklahoma late in the 20th century. Onondaga is spoken at Six Nations and at Onondaga south of Syracuse. Oneida is spoken near London, Ontario, and Green Bay, Wisconsin. There are six Mohawk areas: Kahnawà:ke and Kanehsatà:ke in Quebec; Ahkwesáhsne, which straddles Quebec, Ontario, and New York State; and Ohswé:ken (Six Nations), Thaientané:ken, and Wáhta' in Ontario. Most speakers now live in the first three.

Several other Iroquois languages are known to have existed as well. In 1534, Jacques Cartier encountered people along the St Lawrence River around present Quebec City. Vocabulary in his ship's logs and appended wordlists indicate that these people, now known as the Laurentian, spoke several Northern Iroquoian languages, at least one of which was not ancestral to any of the modern languages. When Champlain returned to the area in 1603, these people had disappeared. They are, however, the source of the name Canada. Another group, the Susquehannock or Andaste, were encountered by Captain John Smith about 1615 in the lower Susquehanna Valley in Pennsylvania. Their language, known through a wordlist recorded by the Swedish missionary Johan Campanius in 1696, was last spoken in the mid-18th century.

Phonology

The consonant inventories of the languages generally consist of one series of obstruents (reflexes of *t, *k, *tʃ, *kʷ, *s), one of resonants (*n, *r, *w, *j), and one of laryngeals (*h, *ʔ). Voicing is not distinctive. Noteworthy is the lack of labials. Most of the languages have four oral vowels (*i, *e, *a, *o) and two nasal vowels (*ę, *ǫ). In Proto-Northern-Iroquoian, stress was penultimate, and open, stressed syllables were lengthened.

There have been several innovations of interest. One is stress in Cayuga. Cayuga stress placement depends on syllable count from both edges of the word. Primary stress falls on the penultimate syllable, providing that it is even-numbered counting from the beginning of the word: *satkáhthoh* 'Look!' If the penult is odd-numbered, it is stressed only if it is open: *senhotǫ́:koh* 'Open the door!' If the penult is odd-numbered and closed, stress is antepenultimate: *sasaky'atáwihsih* 'Take your shirt off!' Epenthetic vowels, added after the establishment of basic penultimate stress in Proto-Northern Iroquoian, are not counted, like the *-a-* stem joiner in *sakyá'tawi't* 'Put your shirt on!' Stress on the second of two adjacent vowels moves to the first: *sasana̲háowe:k* 'Put your hat back on!' If conditions are not met for penultimate stress, and there is no antepenultimate syllable, the word carries no stress: *sa̲hsyǫ'* 'you returned.'

Cayuga shows another interesting innovation. In odd-numbered syllables closed by a laryngeal, the laryngeal feature spreads leftward over the entire syllable. If the laryngeal is h, the full syllable is devoiced. (Devoicing is shown orthographically by underlining.) If the laryngeal is glottal stop, the full syllable carries creaky voice, indicated here by a wavy underline: *w̲a̲hsí'ta̰'keh* 'on its foot.'

Several of the languages have developed distinctive tone under the effect of laryngeals. In Mohawk, stressed syllables generally show high pitch (if short) or rising pitch (if long). Stressed syllables closed by a laryngeal (glottal stop, or h followed by a resonant), however, developed a special pitch contour: a rise followed by a deep fall. The triggering laryngeal subsequently disappeared before a consonant. There are now contrasts, such as *oká:ra'* 'story' (with rising tone) and *okà:ra'* 'eye' (**okáhra'*). (Mohawk examples are given here in the community orthography. Nasalized vowels ʌ̨ and ų are written en and on respectively, glottal stop with an apostrophe ', vowel length with a colon :, stress accompanied by high or rising tone with an acute accent, and stress accompanied by falling tone with a grave accent. The palatal glide j is represented by i. Other symbols have approximate IPA values.) Western Cherokee underwent more complex changes resulting in tone. Feeling (1975) distinguishes three level tones (2, 3, 4), a rising tone (23), and two falling tones (32, 21, written 1), as in *a¹hyv²³ki³di²ýa* 'he's capturing him.'

Morphology and Syntax

All of the languages are polysynthetic. Verbs in particular can be composed of large numbers of meaningful parts (morphemes), like Mohawk *en-hske-rhar-átst-en-'* 'you will promise me' (FUT-2. sing/1.sing-expect-CAUS-BEN.APPL-PER). All verbs contain at least three parts: a pronominal prefix, a verb root, and an aspect suffix. The pronominal prefix refers to the core arguments of the clause: *-hske-*'you/me' in the verb above. The prefix appears in the verb whether or not there are coreferential independent nominals in the clause as well, but it is fully referential in its own right.

There is little evidence of Subject or Object categories. The pronominal prefixes show grammatical Agent/Patient patterning. The semantic basis underlying the system is still clear. Agent prefixes typically represent participants who are actively in control and instigating events or states, as in Mohawk ***ra**-tahónhsatats* '**he** is listening,' ***ra**-ná:ie* '**he** is conceited,' or ***rá**-hsere's* '**he** is chasing it.' Patient prefixes typically represent participants who are affected by a situation but not in control: ***ro**-thón:te'* '**he** hears it,' ***ró**-ta's* '**he** is sleeping,' or ***ró**-hsere's* 'it is chasing **him.**' The system is now fully routinized, however. Speakers do not judge degrees of control as they speak; they simply learn which set of prefixes to use with each verb.

Agent prefixes are used in both events and states (*jump, be conceited*), and Patient prefixes are used in both events (*holler*) and states (*be poor*). The system is thus basically Agent/Patient rather than Active/Stative. Superimposed on it, however, is one element of Active/Stative patterning. Some verbs occur only in the Stative: *rahseró:hen'* 'he is quick-tempered,' *ró:ten* 'he is poor.' Others occur in all three aspects: Habitual *ratè:kwahs* 'he escapes,' Perfective *wahatè:ko'* 'he escaped,' Stative *rotè:kwen* 'he has escaped.' With verbs like *escape*, which describe a change of state, the Stative aspect form typically has a Perfect meaning: *he has escaped*. All Perfect Stative verbs occur with Patient prefixes, whether their Habitual and Perfective forms appear with Agents or Patients.

The Northern Iroquoian languages show extensive, productive noun incorporation. The Southern language Cherokee shows traces of incorporation embedded in the lexicon, indicating that incorporation was productive in Proto-Iroquoian. Incorporation is a process whereby a noun stem is compounded with a verb stem to form a larger verb stem: *-itsker-onti-* 'saliva-throw = to spit.' There is no explicit specification of the semantic role of the incorporated noun; it simply indicates the involvement of a type of entity, often as a semantic patient, but sometimes as an instrument, location, source, or goal. Examples can be seen in Mohawk *wa-ho-n-**itsker**-ón:ti-'* FACTUAL-MASC.sing.AGT-MIDDLE-**saliva**-throw-PER 'he **saliva**-threw = he spit' and *ka-**hseriie't**-áner-en'* NEUTER-**cord**-tie-STATIVE 'it is **cord**-tied.' Incorporation is used pervasively to create new vocabulary and also to manipulate the flow of information through discourse. Important new participants are typically introduced with independent nominals, but those that are already part of the scene or of peripheral importance may be carried along as incorporated nouns.

Lexical categories are clearly distinguished by their internal morphological structure. Particles, by definition, are morphologically unanalyzable (*tóka'* 'maybe,' *oh* 'what,') though they may be compounded (*nek tsi* 'the only' for 'because'). Nouns contain a prefix specifying the gender of the referent or its possessor, a noun stem, and a noun suffix: *ka-nà:tsi-a'* NEUTER-kettle-NOUN.SUFFIX 'kettle,' *ake-nà:tsi-a'* 1.sing.ALIENABLE.POSS-kettle-NOUN.SUFFIX 'my kettle.' Alienable and inalienable possession are distinguished. Verbs follow an entirely different pattern, and can be quite complex morphologically. In addition to the obligatory pronominal prefix, verb root, and aspect suffix, they may contain various prepronominal prefixes. In the Northern languages, these are the Partitive, Contrastive, Coincident, Negative, Translocative, Factual, Duplicative, Future, Optative, Cislocative, and Repetitive. They may contain a Middle, Reflexive, or Reciprocal prefix. As seen above, they may contain an incorporated noun stem. Following the verb root, there may be one or more derivational suffixes, such as an Inchoative, Reversive, Causative, Instrumental Applicative, Benefactive Applicative, Distributive, or Purposive. After the aspect suffix, there may be a postaspectual suffix: a Past, Continuative, or Progressive. Such structure can be seen in the Mohawk *a-khe-'nikonhr-áks-a't-e'* OPT-1.sing/INDEF-mind-be.bad-CAUS-PER 'I would insult someone,' or *ia'-te-iako-hah-a-hiia'k-on-hátie'* TRANSLOCATIVE-DUPLICATIVE-FEM.PAT-road-STEM. JOINER-cross-STATIVE-PROG 'she was crossing the street.'

The morphological composition of particles, nouns, and verbs is thus entirely distinct. Noun stems never appear in the verb stem position of verbs, and verb stems never appear in the noun stem position of nouns. The match between internal morphological form and external syntactic function, however, is not isomorphic. Some morphological particles function syntactically and semantically as nominals, such as *è:rhar* 'dog.' Morphological verbs can function syntactically as predicates, as nominals (without further derivation), or as full clauses, as below.

Nahón:ne'	tehniiáhse
n-a-honn-e-'	te-hni-iahse
PART-OPT-MASC.PL.AGT-go-PER	DUPLICATIVE-MASC.DU.AGT-be.together.STAT
'they would go there'	'they two (males) are together'
niristì:sere's	nahshakotihahónnien'.
ni-rist-i'ser-e'-s	ne = a-hshakoti-hah-onni-en-'
MASC.DU.AGT-steel-drag-STAT-DIST	the = OPT-MASC.PL/3.DPL-road-make-BEN.APPL-PER
they (males) steel drag around	the they would road make for them

'They would go serve as guides for two surveyors.'

Finally, there is no basic, syntactically defined word order. In part because of the richness of the verbal morphology, the proportion of verbs to nouns and of predicates to nominals is much higher in Iroquoian languages than in many languages of Europe and Asia. There are few oblique or adjunct nominals. When clauses do contain multiple constituents, all orders are not only possible, they can also all be seen to be pragmatically motivated by the discourse at hand.

Islam and Arabic

M Abdel Haleem, School of Oriental and African Studies, London, UK

Arabic today is the main language of nearly 300 million people in the Middle East and North Africa. Since 1974 it has been recognized as one of the official languages of the United Nations. Like Hebrew, Aramaic, and Syriac, Arabic belongs to the Semitic group of languages. In the course of history it has been the language of a religion, a transnational state, and a widespread centuries-long civilization that has produced a rich heritage of knowledge, wisdom, and culture. It is used for religious purposes by 1.3 billion Muslims worldwide, and it is the language in which Islamic knowledge at its highest level has always been conducted. This status was achieved as a result of its connection to Islam through its sacred scripture, the Qur'an. The effect of the Qur'an on the Arabic language was, to an extent unknown for any other language of the world, dramatic, profound, and lasting.

The Impact of the Qur'an

Before the spread of Islam, Arabic was confined to the Arabian Peninsula, where it was spoken and used as a literary language by the native Arab population. Very little written material survives from the early centuries of the Christian era, the earliest being the Namara inscription in the Syrian desert, dated 328 C.E.; the output of the Arabs, particularly in poetry, was preserved as an oral tradition. In fact the Qur'an, when it was compiled in one volume, about 14 months after the death of the Prophet Muhammad (632) under his successor Abu Bakr, was the first book in Arabic. Thereafter, however, in line with the first revelation of the Qur'an in 610 C.E.:

> Read! In the name of your Lord who created: …. Read! Your Lord is the Most Bountiful One who ***taught by***

Finally, there is no basic, syntactically defined word order. In part because of the richness of the verbal morphology, the proportion of verbs to nouns and of predicates to nominals is much higher in Iroquoian languages than in many languages of Europe and Asia. There are few oblique or adjunct nominals. Islam and Arabic

M Abdel Haleem, School of Oriental and African Studies, London, UK

Arabic today is the main language of nearly 300 million people in the Middle East and North Africa. Since 1974 it has been recognized as one of the official languages of the United Nations. Like Hebrew, Aramaic, and Syriac, Arabic belongs to the Semitic group of languages. In the course of history it has been the language of a religion, a transnational state, and a widespread centuries-long civilization that has produced a rich heritage of knowledge, wisdom, and culture. It is used for religious purposes by 1.3 billion Muslims worldwide, and it is the language in which Islamic knowledge at its highest level has always been conducted. This status was achieved as a result of its connection to Islam through its sacred scripture, the Qur'an. The effect of the Qur'an on the Arabic language was, to an extent unknown for any other language of the world, dramatic, profound, and lasting.

The Impact of the Qur'an

Before the spread of Islam, Arabic was confined to the Arabian Peninsula, where it was spoken and used as a literary language by the native Arab population. Very little written material survives from the early centuries of the Christian era, the earliest being the Namara inscription in the Syrian desert, dated 328 C.E.; the output of the Arabs, particularly in poetry, was preserved as an oral tradition. In fact the Qur'an, when it was compiled in one volume, about 14 months after the death of the Prophet Muhammad (632) under his successor Abu Bakr, was the first book in Arabic. Thereafter, however, in line with the first revelation of the Qur'an in 610 C.E.:

> Read! In the name of your Lord who created: …. Read! Your Lord is the Most Bountiful One who ***taught by***

> *[means of] the pen,* who taught man what he did not know. (Q. 96:1–5)

the Arabs began to use the pen in earnest.

Before Islam, the Arabic script, derived from a Nabatean version of Aramaic, was rudimentary, containing only the consonants, and even among these there was no distinction between groups of letters of the same shape such as those representing *b, t,* and *th* or *j, h,* and *kh*. The script was developed in the Islamic era in order to achieve accurate pronunciation of the words of the Qur'an. Vowel signs and diacritical dots were introduced mainly by Al-Khalil ibn Ahmad Al-Farahidi (d. 786 C.E.), as commanded by the Ummayad governor Al-Hajjaj ibn Yusuf. This development continued further into the refinement of Arabic calligraphy as the noblest art of Islam, all to write and celebrate the word of God.

Within the space of 100 years after the death of the Prophet Muhammad in 632 C.E., Arabic had spread outside the Arabian Peninsula, both with the Arab armies and with emigration, into the Levant, the Fertile Crescent, Egypt, North Africa, and Spain, and in the East to Persia and beyond. It was to supersede, to a greater or lesser extent, such local languages as Aramaic, Greek, Coptic, Berber, and Persian, though naturally this process took some time. Arabic was first used for religious, administrative, political, and high cultural purposes and later spread to the population at large in the Middle East and North Africa, to become permanently the language of the majority. Persians wrote in Arabic for the first three centuries after Islam spread to Persia, and although Persian gradually regained precedence, Arabic left behind a great contribution of vocabulary and phraseology, particularly in religious and cultural fields. The Arabic script was also adopted for many Islamic languages, including Persian and later Urdu, Punjabi, Turkish, Hausa, Swahili, Malay, and Indonesian. Later Turkey changed, in 1928 and under European influence, to using the Roman script, as did many other countries, including Malaysia and Indonesia. Even in these countries, however, Arabic with its script continued to be used for religious studies.

Arabic Linguistic Scholarship

The Arabs did not study the grammar of their language before the Qur'an: it was in order to protect and understand the text of the Qur'an that Arabic grammar began to be codified. This started a flourishing tradition of Arabic linguistic scholarship. The important linguistic studies produced therein still command the admiration of modern linguists. Arabic phonetics, which started in order to describe exactly the proper pronunciation and articulation of the Qur'an, developed into a science of *tajwid,* good recitation of the Qur'an, an art that continues to develop. Similarly, the study of Arabic syntax flourished for the service of the Qur'an.

Especially significant in this field are works of the outstanding scholar, Abdul Qahir ibn Abdul Rahman al Jurjānī (d. 1078 C.E.), who dedicated his *Dalā'il al-I'jāz* and his *Asrār al-balāgha* to investigating the style and rhetoric of the Qur'an, in an attempt to identify the reasons for the inimitability (*i'jāz*) of its language. To give a brief example, two key concepts were discussed by al-Jurjani and others: context and internal relationships. The importance of context (*maqām*) was recognized and formulated for the study of the text of the Qur'an by Muslim linguists. In this respect, their work anticipated by many centuries modern linguistic thinking about the crucial importance of context in understanding discourse. Internal relationships were encapsulated in the dictum: *al-Qur'an yufassir ba'duhu ba'da* (different parts of the Qur'an explain one another), which, given the structure of Qur'anic material, was argued to provide the most correct method of understanding the Qur'an.

The text of the Qur'an was crucial for the development of the Arabic science of rhetorics, but Arab writers also drew on the text of the Qur'an in their study of the principles of literary criticism. This can be seen in the celebrated work of the famous critic Ibn al-Athir in his book *Al-mathal al-sā'ir fī adab al-kātib wa sha'ir* ('On the criticism of prose and poetry'). Lexicography was another discipline that was started to serve the Qur'an and flourished to a great extent in the Arabic tradition, the first, a landmark dictionary, being *Kitab al-'ayn* by Al-Khalil Ibn Ahmad (died 786 C.E.). As stated by Suyuti (d. 1505 C.E.), a writer on many subjects including Qur'anic studies and linguistics, the Qur'an was in fact the source for all branches of Arab knowledge.

The status of linguistic studies in the Arabic tradition was elevated because of its connection with the Qur'an. In our first grammar lessons, at the primary school of Al-Azhar in Cairo (the oldest functioning institution of Islamic learning in the world, opened in 972 C.E.), we were taught *Al-Mabadi' al-'ashara,* The Ten Introductory Aspects, with which the textbook began; we then learned that these ten aspects, as handed down by the ancient tradition, were points to be considered when embarking on any branch of knowledge. They included the definition of that particular branch, its name, its issues, its founder, its relation to other subjects, its status among other subjects, and how the Shari'ah views the learning and application of that subject. The status of grammar, we were told, was very high because it ensures correct

understanding and reading of the Arabic text of the Qur'an. As such its study was a communal obligation on the Muslim community. Thus learning grammar and linguistics, in addition to any educational or secular purpose, was a religious duty in Al-Azhar and similar traditional institutions of learning in the Muslim world.

Expansion of Arabic Knowledge

In the early centuries of Islam, the Muslims, inspired by the Qur'anic injunction, 'Say, "Lord increase me in knowledge"' (20:114), considered it their duty to translate (into Arabic), absorb, and develop the valued knowledge of ancient civilizations, such as Greece, Rome, Persia, India, and China. This provided another channel by which the local literary output in Arabic grew under Islam. In this case it drew in external sources to form another part of the vast corpus of learning in Arabic. Some of this Arabic scholarship was then, from the 12th century C.E., translated into Latin and acted as a contributing factor to the European Renaissance. The great tradition of learning in Arabic was developed not only by Arabs but also by Muslims from all over the world in their service of Islam. Chief among these were scholars from Persia and Central Asia, writing in Arabic. Worthy of special mention are scholars of Qur'anic exegesis (e.g., Al-Rāzī, d. 1209), the compilation and criticism of Prophetic sayings (hadīth) (Bukhārī, d. 870; Abū Dāwūd, d. 888; Tirmidhī, d. 892; and Al-Nasā'ī, d. 916), Arabic linguistics (e.g., Sibawayhi, d. 793 and Al-Jurjanī, d. 1078), and philosophy (Ibn Sīnā, d. 1037 and Al-Farābī, d. 950).

Arabic Studies in the West

We may mention here another vigorous tradition of Arabic linguistic scholarship, this time in Western universities (especially since the 17th century). This tradition was, from the beginning, driven above all by its relevance to Islam, and it produced monumental works in the study of Arabic and Islam in the leading centers of learning and in various European languages such as Dutch, English, French, German, Italian, Russian, and Spanish.

Memorizing the Qur'an, and Its Use in Worship

It is the Arabic Qur'an that is considered to be the word of God, not any translation. This makes Muslims throughout the world eager to learn some of it in Arabic. Both Arabs and non-Arabs, including women, are known to memorize the whole Qur'an or a large amount of it. There are international Qur'an recitation competitions held in Malaysia, Indonesia, and Iran, to name but a few, sometimes state funded, where the Qur'an is recited from memory. There is one particular passage, the first Sura, *Al-Fātiha*, which all Muslims learn, as it is an obligatory part of the five daily prayers in Islam, and normally, in addition to this, they learn other short passages. Muslims all over the world perform their daily prayers in Arabic, in imitation of the Prophet's example, and in keeping with the unbroken tradition, even though, according to at least one school of law, the Hanafi, if they do not know Arabic, they can perform the prayer in their own language. If we assume a group of ten Muslims come together from differing linguistic backgrounds, with no common language, they can all pray together, as it is the same Arabic prayer for all of them. Any of them is, moreover, eligible to lead the prayer.

As the Qur'an and Hadith are in Arabic and are the fundamental sources of Islamic law and teaching, the main classical works of the different schools of law, which are followed to this day, are all written in Arabic. This means that advanced Islamic studies in non–Arab Muslim countries are conducted in Arabic by the followers of all the various schools, Shāfi'ī in South East Asia, for instance, Hanafī in South Asia and Turkey, Ja'afarī in Iran, and Mālikī in West Africa. Thus Islam has kept Arabic alive in the religious scholarship of non-Arab Muslims. Even within the central area of the Islamic world, the Arab Middle Eastern and North African countries, it is Islam that has kept the Arabic language alive and given it this unrivaled position. The literary language, common to all Arabs, is used for writing, education, and formal speech. The connection of Arabic to the Qur'an has secured this position for the Arabic language up to today. Around the beginning of the 20th century in Egypt, for instance, there were calls for the adoption of English or of the Roman script for writing, or even the local Arabic dialect of Egypt. These were fiercely rejected because it would have meant cutting off the following generations from the language of the Qur'an and Hadith, Islamic Law, and the Arabic literary heritage.

Arabic in Western Cities

In recent times, Muslims have settled in every continent, including Europe and America. Arabic schools are set up for their children, also mosque schools, where the Arabic Qur'an is taught. It is remarkable that Muslims from non-Arab countries such as South Asia, Turkey, and Africa insist on having a Friday sermon in Arabic from the pulpits in Europe and

America, even if they have additional sermons in their own languages normally preceding the prayer time. Despite the growing body of Muslim writing on Islam in European languages, Arabic, the language of the Qur'an, still has a privileged position that cannot be replaced by any other language.

Islam in Africa

J Hunwick, Skokie, IL, USA

After the death of the Prophet Muhammad in 632 A.D., Arab Muslim forces overtook most elements of the Byzantine-ruled areas of the Middle East, and then in 639 moved into the African continent, taking over Egypt from the Byzantines, and then moving westward through North Africa. They reached what is now Tunisia and established their fortress town at Qairawan in 670, and by the end of the 7th century they had occupied land up to the coast of the Atlantic Ocean, though not taking over territory very far south of the Mediterranean Sea.

Importantly for them, the Berber populations of their occupied territories mostly converted to Islam. In this way, Islam passed on to Saharan nomads, particularly the Berber Sanhaja of the western Sahara. With a renewal and growth of their faith in the mid-11th century, the Sanhaja formed a movement, known as the Almoravids, that then occupied all of the region of modern Morocco, and moved into the area of Spain formally overtaken by Arab Muslims. As widespread Saharan nomads, their faith to Islam soon began to have influence on West African black populations. The Massufa clan of the Sanhaja migrated along the southern region of the Sahara in the late 11th century, some of them settling in Walata, Sane (near Gao), and the Takedda region; some Sanhaja took up an area that later became Timbuktu, and, indeed, it was Sanhaja scholars who later made Timbuktu a major center of Islamic learning.

Among early West Africans to adopt Islam were the Dyula (also called Wangara), a clan of the Mande ethnic group, the rest of which later became Muslims. The Dyula mainly engaged in trade and moved widely around West Africa, influencing other peoples to adopt Islam. Another important ethnic group to largely adopt Islam was the Fulani (or Fulbe), nomadic cattle owners, who moved from the edge of the southern Sahara down into the Inland Delta of the Nile river and then elements of this group moved to other areas, such as Futa Toro and Futa Jallon, and eventually moved eastward into northern Nigeria and on to Chad and Dar Fur. By the 9th century, North African Muslims (Arab/Berber) began to cross the Sahara for trade, including to obtain slaves, and no doubt they had influence of conversion on the rulers they contacted.

Among the early and most celebrated persons converted to Islam were a number of rulers in the Sahel zone: the ruler of Takrur, in the Senegal river area;

America, even if they have additional sermons in their own languages normally preceding the prayer time. Despite the growing body of Muslim writing on Islam in European languages, Arabic, the language of the Qur'an, still has a privileged position that cannot be replaced by any other language.

Islam in Africa

J Hunwick, Skokie, IL, USA

After the death of the Prophet Muhammad in 632 A.D., Arab Muslim forces overtook most elements of the Byzantine-ruled areas of the Middle East, and then in 639 moved into the African continent, taking over Egypt from the Byzantines, and then moving westward through North Africa. They reached what is now Tunisia and established their fortress town at Qairawan in 670, and by the end of the 7th century they had occupied land up to the coast of the Atlantic Ocean, though not taking over territory very far south of the Mediterranean Sea.

Importantly for them, the Berber populations of their occupied territories mostly converted to Islam. In this way, Islam passed on to Saharan nomads, particularly the Berber Sanhaja of the western Sahara. With a renewal and growth of their faith in the mid-11th century, the Sanhaja formed a movement, known as the Almoravids, that then occupied all of the region of modern Morocco, and moved into the area of Spain formally overtaken by Arab Muslims. As widespread Saharan nomads, their faith to Islam soon began to have influence on West African black populations. The Massufa clan of the Sanhaja migrated along the southern region of the Sahara in the late 11th century, some of them settling in Walata, Sane (near Gao), and the Takedda region; some Sanhaja took up an area that later became Timbuktu, and, indeed, it was Sanhaja scholars who later made Timbuktu a major center of Islamic learning.

Among early West Africans to adopt Islam were the Dyula (also called Wangara), a clan of the Mande ethnic group, the rest of which later became Muslims. The Dyula mainly engaged in trade and moved widely around West Africa, influencing other peoples to adopt Islam. Another important ethnic group to largely adopt Islam was the Fulani (or Fulbe), nomadic cattle owners, who moved from the edge of the southern Sahara down into the Inland Delta of the Nile river and then elements of this group moved to other areas, such as Futa Toro and Futa Jallon, and eventually moved eastward into northern Nigeria and on to Chad and Dar Fur. By the 9th century, North African Muslims (Arab/Berber) began to cross the Sahara for trade, including to obtain slaves, and no doubt they had influence of conversion on the rulers they contacted.

Among the early and most celebrated persons converted to Islam were a number of rulers in the Sahel zone: the ruler of Takrur, in the Senegal river area;

the king of the Zuwa dynasty in Gao, and the ruler of Kanem, just north of Lake Chad. All of these conversions were in the 11th century. Later, rulers of major empires promoted Islam, making pilgrimages to Mecca, e.g., Mansa Musa of Mali in 1324 and Askiya Muhammad of the Songhay Empire in 1497. As a pious Muslim, Askiya gave support to the Islamic community of Timbuktu, a city of Muslims ever since its initiation in the early 12th century. Muslim scholars migrated there from North Africa and from Saharan oases, and when Mansa Musa returned from his pilgrimage, he stopped in Timbuktu and had the Great Mosque (Jingere Ber) built, a Muslim shrine soon afterward to be added to with the large Sankore mosque. The most celebrated scholarly clan to settle in Timbuktu was the Aqit family of the Sanhaja Massufa, coming from Masina in the south of the Inland Delta.

Many works on aspects of Islam – especially shariah – were written in Arabic in Timbuktu, especially in the 15th–17th centuries, and even down to the 20th century. Some Muslim scholars possessed large libraries of such manuscripts – many still in existence – and in 1973 a huge public library of manuscripts was founded: the Ahmad Baba Center (Centre de Documentation et de Recherches Historiques Ahmad Baba [CEDRAB]). Ahmad Baba (1556–1627), after whom it was named, was one of the most celebrated Timbuktu scholars, a member of the Aqit family, though he was exiled to Morocco in 1594, returning home in 1608. He wrote nearly 70 works, and became celebrated in Morocco as well as in West Africa.

A West African scholar who once quoted him was the Fulani Uthman ibn Muhammad Fudi (or Usman dan Fodio), who set up a jihad in the Sokoto region of northwestern Nigeria in 1804, creating an Islamic empire out of most of the Hausa states of what is now northern Nigeria. His ancestors had migrated to that region from Futa Toro in the 16th century, though Islam had other influences in Hausaland. Kanem became an early Islamic state, and in the 13th century took over what is now Bornu, and from there, to the west of Lake Chad, Islam then had influence farther west. There was also influence in one area of Hausaland from the Dyula. Some of them had moved south from Jenne to obtain the gold being mined in what is now southern Ghana, to be taken to Jenne and then Timbuktu for trans-Saharan trade. When Songhay took over the Inland Delta in the 1470s, the Dyula decided to take the gold to a different trans-Saharan trading location, and so some of them went off to Kano, others of them having already converted the ruler of that city and state, a trading zone with trans-Saharan interconnections.

Islam later spread farther south in West Africa. In the second half of the 17th century, some scholars moved from Timbuktu to the north of what is now the Republic of Ghana. In the same period, some Dyula also settled in that area, and a century or more later Hausa migrants moved into the region, so the area between the Black and White Volta rivers became a new region of Islam, and by the 19th century a source of Arabic-Islamic writings. Similarly, in what is now Nigeria, Islam's influence moved south, following the early 19th-century jihad that created the Sokoto Caliphate. The Nupe adopted Islam, and in 1824 the northern Yoruba town of Ilorin became part of the Caliphate, and soon produced Muslim scholars who wrote Arabic treatises. Some later moved south as far as Abeokuta and Lagos; notably Adam al-Iluri (1917–1992), who set up at Agege, near Lagos, an Arabic and Islamic training center in the mid-20th century, and published there many of his 70 Islamic writings and those of some of his colleagues.

Although West Africa became a major area of Islamic writings, Islam became the main religion of other areas of Africa. Many nomadic Arabs moved into Egypt south of Cairo, and by the 14th century began moving farther south, causing Islam to take over the Christian kingdom of Nubia in the north of the present Republic of the Sudan. In the following centuries, Arab Muslim nomads in Egypt took over much of what is now that republic, while others moved directly from Arabia across the Red Sea. In 1820–1821, the Sudan was taken over by Egypt, then part of the Ottoman Empire, and some 60 years later a north-Sudan Muslim scholar, Muhammad Ahmad ibn Abdullah, declared himself to be '[God-]guided' – the Mahdi, a position normally seen as the final reviver of God's will for humanity. Early in 1885, he took over the main city of Khartoum, after controlling all the rest of the Muslim-inhabited sectors of the country, and died a few months later, to be succeeded by a successor: the *khalifa*. Although in 1898 the Sudan was occupied by the British and the Egyptians, who fought and killed the Khalifa, it remained, except for the far south, a land of Islam, including Darfur, a Muslim state to the west, now on the border of the Chad Republic.

Bordering the Sudan to the east is the state of Ethiopia (plus Eritrea), which was originally a Christian land, but its lowlands became Islamic territories in the 14th century. Some Muslims from Mecca had fled to an area of northern Ethiopia in 615, and the Arabs later respected Ethiopians, even before some converted to Islam. Ethiopia then borders Somalia, now nearly 100% Muslim, with some of its tribes, although not ethnically fully Arab, claiming that

they migrated to the Horn of Africa from Arabia many centuries ago. Early in the 20th century, just as the British were beginning to occupy a northwestern area of the Horn, a Muslim man, Mohamed Abdille Hassan (1864–1920) referred to by some as a *mahdi*, brought together many other Somalis, attempting to get them to abandon the Qadiriyya Sufi order and adopt the Salihiyya order that he had adopted in a visit to Mecca, and also to reject colonialism. The Salihiyya Sufi order was a product of Sufi teachings promoted by Ahmad ibn Idris, who moved out of Morocco in 1789, along North Africa to Cairo and then Upper Egypt, and finally into Arabia – Mecca and then Yemen. His teachings produced a number of branches of his movement. Other than the Salihiyya, several parts of Africa received his disciples. Libya, for example, got Muhammad al-Sanusi (1787–1859), of Algerian origin, whose order, the Sanusiyya, took off in Jaghbub and then expanded into southern Libya, and later, under his successor, into much of Chad. Another disciple was Muhammad Uthman al-Mirghani (1793–1852), from a Meccan Sharifian family, who was sent by his teacher to Eritrea, where he was treated hostilely and returned to Mecca; then he went to Upper Egypt and later into the Sudan for 4 years, promoting *al-Mirghaniyya*; and when in Kordofan, a man called Isma'il al-Wali took over some of his teachings and set up his own order, the Isma'iliyya. Al-Mirghani's Sufi teachings then became known as al-Khatmiyya, and he promoted them elsewhere in the Muslim lands of the Sudan. Also, another branch of the Idrisiyya (the teachings of Ahmad ibn Idris) was taken down into East Africa, where the Swahili populations were already Muslims. The Swahili population and language had, in fact, come to exist through Arabian visitors and settlers from the early centuries of Islam.

Islam also became practiced much farther south – in what is now called South Africa – mainly by people of Asian origin, brought into the region by colonial authorities: by the Dutch in the 18th century, many as slaves, including some from West or East Africa; then in the late 19th century the British brought Indians as indentured laborers. Through their presence, some local black Africans converted to Islam. In Cape Town, several mosques were built in the center of the city, and recently the Koran has been translated into their Xhosa language.

As for Sufi orders – or *tariqas* as they are called in Arabic – two carried strong spiritual influence on western Africa. The first was the Qadiriyya, originating in Baghdad in the 12th century under the teachings of Abd al-Qadir al-Jilani, later adopted in North Africa and by Saharan tribes such as the Kunta, an Arab-Berber tribe containing intellectuals, originally in the Touat oasis, who moved south from the 17th century and split in two, with a major group just north of Timbuktu and governing Timbuktu in part of the first half of the 19th century. The Qadiriyya was also adopted in northern Nigeria (notably by Uthman ibn Muhammad Fudi) and in Senegal. Another *tariqa*, the Tijaniyya, overtook it in the 19th century, though not among the Kunta. Ahmad al-Tijani (1737–1815), the founder of that Sufi order, was born in an Algerian oasis Ayn Madi, and then moved to Fez in Morocco. His teachings – following study of other Sufi *tariqas* – were adopted by the Idaw Ali tribe of southern Mauritania, and were also promoted by al-hajj Umar ibn Sa'id of Futa Toro in Senegal, who later conquered much of present-day Mali. The Tijani *tariqa* became appreciated in Senegal, and led by the shaykh Ibrahim Niasse (1902–1975), it was adopted by many West Africans as he traveled into Mali, Ghana, and Nigeria, and subsequently on to Chad and the Sudan. In Senegal, another *tariqa* was created: the Mouride order, inspired by Ahmad Bamba (1855–1927), originally a Qadiri. In the second half of the 20th century, however, Sufi *tariqa*s – especially the Tijaniyya – were opposed in speech and writing by Africans who had spent time in Arabia and come under the conveying influence of the Wahhabiyya movement. Whereas Sufi orders put little emphasis on *shari'ah*, the Wahhabiyya created its own Islamic law views, based on the Hanafiyya, though all West African Muslims belonged to the Maliki *madh'hab*.

Islam in East Asia

J Wang, Shanghai Normal University, Shanghai, China

Generally, the Muslim population in China is scattered over the country but concentrated unevenly in certain areas; as a result, Islam in China shows a considerable diversity of detail, although the basic Islamic principles are preserved in the form of community. Chinese Muslims are a group of different ethnic groups, languages, customs, and cultures. Therefore, Islam in inland China is always in interaction with Chinese religions and Chinese cultures; however, Islam in the frontier regions of China is connected with its counterparts in Central Asia, South Asia, and South-East Asia.

The first bearers of Islam to China were not missionaries but merchants who came to China by the Silk Road on land and for the spice trade by sea. The official contacts of the Arab Caliphate and the Chinese Empire began in 651 as the Caliph Uthman sent an envoy to Xi'an, the capital under the Tang Dynasty (618–907). Another large wave of Muslim immigrants consisted of the warriors who were sent by the Caliph Jafar Mansur of the Abbasid Dynasty in 755 to help the Chinese empire quell a rebellion. After recapturing the capitals of China, these soldiers were given the right to stay in China as a gratuity for their service. Their settlements developed into Muslim communities.

The earliest period of Islam in China did not exercise much influence over the Chinese people. The Muslims lived in a special section of a town and kept their own customs and way of living, had their own administration system, built mosques, and appointed their own judge to be in charge of religious and legal affairs. In a riot in 878, the revolting Chinese peasants besieged Canton, in which about 120 000 Muslims, Christians, and Jews were killed and their communities looted. However, during most of this period, the relations between the Muslims and the Chinese were peaceful.

When the nomadic Mongols conquered China, they brought many Muslims in their troops from Central Asia and Persia, and so began the second influx of Muslims to China who settled. The Muslims were important allies and aides of the Mongols in ruling this empire and forced the large subject population to submit to the new authority. The sizeable Muslim groups became elites in Chinese society. Not a few Muslims were appointed by the Mongols to the posts of prime minister, minister, and governor, etc. Muslim scientists made contributions to Chinese culture on astronomy, mathematics, geometry, architecture, medicine, and the technologies of handicrafts and weaponry. The spread of Muslims all over the country took place during this Mongol Dynasty (1271–1368). When Marco Polo and Ibn Battuta traveled in China, both noticed that China had an impressive Muslim population, and many towns and cities had special Muslim resident sects, and there were even Sufi monasteries active in the communities.

In Chinese Turkistan, Islam follows another mode. In the 10th century, an Uighur king of the Qara Khan Dynasty under the influence of an older Sufi from Central Asia was converted to Islam and given a Muslim name, Sutuk Baghra Khan. About 200 000 Uighurs also followed him in conversion. The new converts waged Jihad to conquer the other neighboring Uighur kingdoms, which upheld Buddhism, Manichaeism, and Shamanism. However, the Islamization of this region was a long process, and after the turn of the 16th and 17th centuries the whole region called Xinjiang today became part of the Islamic world.

The privileges of Muslims continued during the Ming Dynasty (1368–1644), when the majority Han people resumed their sovereignty over China. The position of Muslims in China did not meet great change except that the first emperor of the dynasty prohibited the Muslims from exercising their 'foreign culture'. Islam in inland China began a rapid acculturation process. Many Muslims devoted themselves to learning Chinese literatures, and in this way they became officials of the civil and military services in the empire. Many Muslims lost their Central Asian identities in this period when they spoke Chinese language and wore local clothes, although some Persian and Arabic terms were kept for their Islamic services. However, the Turkic Muslims retained their Central Asian Islamic culture and ethnic identities due to their close contacts with that region.

In the Qing Dynasty (1644–1911), the relations between Muslims and non-Muslims and between Muslims and the imperial authorities deteriorated, which led to the rigorous policy of suppressing the Muslims. More than ten million Muslims lost their lives in the two major confrontations during the 18th and 19th centuries.

When the Republic (1911–1949) was founded, the Muslims were one of five nationalities in China with equal rights in politics. This change of status in economic, social, and cultural life strengthened contacts with other parts of the Islamic world and reawakened the national consciousness of the Muslim peoples. New-style Islamic schools were set up in many communities. A national network of Islamic associations

was established. But in the 1940s, discontented by the high-handed policy and worsening economic situation, the Turkic Muslims in Xinjiang rose up and founded the short-lived Eastern Turkistan Republic.

The Communist regime replaced the Republic in 1949. Under the extremist leftist influence, the 'Religious Reform' was launched in 1958. Many mosques were closed, and the clerics were put into labor camps. The hostels of the Sufi orders and saints' tombs were forced to be demolished. The religious rights of Muslims had never been threatened to such a degree as during the Cultural Revolution (1966–1976). All religious activities were stopped, and many believers were killed as counter-revolutionaries.

However, since the beginning of the 1980s, the new Chinese leaders have embarked upon a more pragmatic policy with regard to religious affairs. Islam has gained a dramatic revival. China has more than twenty million Muslims with more than 30 000 mosques, according to country's official statistics. Several sects such as Shi'a, Ikhwan Movement, Salafiyya, Jahriyya, Khufiyya, and Qadriyya, as well as Qadim, the traditional Sunni mainstream, are allowed free operation. Many Islamic schools have been established to train the young people in Islamic knowledge and tradition. Every year thousands of Muslims sponsor themselves to go to Mecca on pilgrimage. Many communities publish their own magazines and newspapers to promote Islamic doctrine. Occasional clashes occur between Muslims and non-Muslims or local authorities because of different interests. In Xinjiang, some Uighur Muslims inspired by the event of the newly independent Central Asian republics fight for separatism under the banner of Jihad. The Communist regime through closely monitored organizations such as the Association of Islam tries hard to make Islam accommodate to the Chinese economic-market-type socialism to keep social stability.

Islam affected the Korean peninsula at first through indirect contacts via China in the period of the 10th to the 13th centuries. The *Koryosa* chronicle informs us that Muslims came to Korea through commercial activities and were treated as honored guests by the Kingdom's government (Jeong, 1452). When the Mongols controlled Korea in 1270, some Central Asian Muslims served as administrative officials and settled down in the peninsula where they formed communities. However, in 1427 the government issued a decree prohibiting Islamic performance and customs, and so therefore mostly assimilated the immigrant Muslims. The emergence of new Muslim communities in Korea has taken place 500 years later, in the second half of the 20th century, as South Korea became a strong country economically and came to rely on oil from the Middle East, which led Muslim foreigners to to Korea for trade, study, and work. There is no exact figure for the Muslim population in Korea, but they are certainly not a big community, and mainly composed of Muslim immigrants and local converts.

Islam traveled to Japan about 1891–1922, and some local Japanese embraced this faith. This was followed by Tartar Muslim migrants from Central Asia in 1923 to 1952. In 1956, the Muslim missionaries from Pakistan and India started going to Japan, playing an important role in the spread of Islam. In the late 1950s, students from Muslim countries went to study at Japanese universities. In 1961, the Muslim Students Association was founded. In 1974, the Islamic Center was established in Japan. Several big Japanese cities including Tokyo have mosques supported by Islamic countries such as Saudi Arabia. The Japanese Muslim population is estimated at less than 50 000.

Islam in Southeast Asia

E U Kratz, SOAS, London, UK

This article is reproduced from the previous edition, volume 4, pp. 1787–1788, © 1994, Elsevier Ltd., with revisions made by the Editor.

Islam came to Southeast Asia peacefully and over several centuries. While mainland Southeast Asia by and large remained faithful to Buddhism in its various forms and expressions, Islam had a particular impact on the peoples of insular Southeast Asia speaking Western Austronesian or Indonesian languages. Islam thus took hold of the Indonesian archipelago, parts of the southern Philippines and of the Malay Peninsula, a region often referred to as 'the Malay world.' Southeast Asian Muslims generally follow Sunnite traditions and adhere to the Shafi'i school of law. There are doubts whether traces of an earlier presence of Shi'ite elements in West Sumatra indicate a significant change of allegiance or are due to fairly recent contacts with Indian Shi'ites brought to the region under the British at the beginning of the 19th century.

Although Islam found a more ready acceptance among (coastal) ethnic groups which had previously had contact with Indian religions, it did not, however, replace these completely. But, just as there are pockets of Hinduism and Buddhism alive in the archipelago and in particular on Java and Bali, so too Islam is to be found beyond the Peninsula – on the mainland in Burma, and among the Cham of Kampuchea and Vietnam who, significantly, speak an Indonesian language. The Cham, like so many Southeast Asian peoples, were converted to Islam through the Malays and are said to have received the faith from Brunei and Aceh. Yet, the importance of strong links with Kelantan in the north of the Peninsula, which appear to be of a more recent date, should not be underestimated. The origins of the small, indigenous Muslim community found in Burma must be sought entirely with Indian immigrants, and a once famous Muslim settlement in 17th-century Ayudhya was probably mainly populated by foreign merchants.

At the beginning of the 21st century, there are about 30 million Muslims living in Malaysia (the home of the great majority), Singapore, Brunei, Southern Thailand (Patani), and the Southern Philippines. Indonesia, with 170 million Muslims, is the country with the largest number of Muslim citizens in the world. There is no comprehensive theory to explain the process of Islamization of the Malay world, which followed a different course in almost every ethnic (and thus linguistic) group in which it occurred in the region. One assumes, however, that traders of various nationalities played an important part and that, at least in its early years, Islam came via the southern part of the Indian subcontinent, totally bypassing Moghul culture in the process. This is an important point, since Islam hardly influenced Southeast Asian sciences or culture in the broader sense, focusing almost exclusively on theology and law. As far as existing forms of art were concerned, it would appear that the acceptance of Islam led to the disappearance of many artistic and creative expressions which were not of an immediately religious nature. Others had to adapt radically in order to survive.

The Trengganu Stone inscription of the 13th century, which perhaps not surprisingly deals with legal matters, is the first example of Malay written in Arabic script and clear proof of the even earlier presence of the religion in the region, yet historical evidence would indicate that a more widely spread Islamization only began from the 15th century onwards. This was also the period when Sufi brotherhoods flourished internationally and when, after the Mongol conquest, Indian Ocean trade reached new peaks of intensity.

Once Islam had reached the archipelago and established a first foothold in the coastal trading cities of Sumatra, the Malay language became its main carrier, and it is not surprising that of the languages of Southeast Asia, it is Malay which has been influenced most by Islamic traditions. At some point, being a Malay even became synonymous with being a Muslim. Through Malay, the religion reached the northern coast of Java and most other islands. By the end of the 19th century, the process of Islamization of the Malay world can be said to have been completed, even though some Indonesian Muslims argue that after the conversion of the body, there still remains the task of converting the soul.

In the process of Islamization, Indian scripts and their derivatives were gradually replaced by a modified Arabic script which is closer to its Persian form. This is called *Jawi* in the Malay world where it is still used widely in preference to 'Roman' script, and *pegon* in Javanese (which otherwise adhered to its original, Indic script), where it is used exclusively for writing Islamic texts. Most significantly, *Jawi* provided for additional letters to convey the sounds of *ch, g, ng, ny,* and *p*, which are not found in standard Arabic.

Arabic also exerted its influence on syntax, morphology, and lexicography. While it is true to say that the influence on syntax and morphology is more clearly felt in the realm of theological literature, Qur'ānic exegesis, grammar, and jurisprudence, the influence of lexicography extended much further and

led to the reception and total absorption of a wide range of words of Arabic and Persian origin, extending well beyond the purely religious sphere. The important concept of traditional (non-Islamic) law and custom, which is seen in opposition to Islamic law, is only known under its Arabic term '*adat*.'

It is interesting, however, that even under the influence of Islam the Indic heritage was not completely suppressed, as is evinced by the survival of a Tamil word such as *lebai* for the mosque official and Sanskrit terms for key Islamic concepts such as the fast – *saum* in Arabic, but Sanskrit *puasa* in most Indonesian languages – and the religious disciple, who is still called a *santri*. Equally interesting is the fact that the planners of modern Indonesian, besides drawing on European languages, turn to Sanskrit rather than Arabic when it comes to the coining of new words and expressions. It is worth remembering, however, in this connection that in the late 20th century the influence on Indonesian of Javanese, which had always been more influenced by Sanskrit, was stronger than that of Malay. In view of the ethnic distribution of Indonesia's population, 60% of whom speak Javanese and only 5% Malay as their first language, this would appear natural, although non-Javanese Muslims find this Javanese influence hard to accept.

Islam in the Former Soviet Union

S Akiner, SOAS, University of London, UK; updated by **D Kurzon** University of Haifa, Haifa, Israel

Some 80 million Muslims (2003) live in the territories of the former Soviet Union, a Muslim population second in size only to those of such countries as Indonesia, Pakistan, Bangladesh, and India. Almost all are Sunni (as are the majority of Muslims in general) of the Hanafi school. There are, however, some Shi'ites in Azerbaijan and several thousand Ismailis, followers of the Aga Khan, in the Pamir mountains of Tadjikistan, in the regions adjacent to Pakistan, Afghanistan, and China.

Taken as a whole, the Muslims amount to some 20% of the total population of the old Soviet territories. However, there is considerable ethnic diversity among them. Some 85% are Turkic; of these, the Uzbeks (22.6 million) are the most numerous, constituting the third largest nationality after the Russians and the Ukrainians. Those belonging to the Iranian family account for 8% the Tadjiks (6 million) are by far the largest nationality in this group. The Caucasian family includes such peoples as the Avars, Laks, Lezgis, and Dargis; none very large in size, they speak languages that are almost wholly mutually incomprehensible.

Muslims are concentrated in three regions: in Central Asia (60%), Transcaucasia (20%), and the Volga region and Siberia (20%). Islam was brought to Central Asia and Transcaucasia by Arab invaders in the 7th century, scarcely 20 years after the death of the Prophet. It gradually gained ascendancy, to become in time the dominant force in those societies. The Tatars and Turkicized Mongols of the Golden Horde, who accepted Islam during the 13th and 14th centuries, carried the religion to the far side of the Urals, along the Volga and Siberia; it remained restricted to the tribes of the Golden Horde, however, and did not spread to the Slav population, who remained Christian.

The power of the Golden Horde began to wane during the 15th century, while that of Muscovy grew ever stronger. The capture of the Tatar strongholds of Kazan (1552) and Astrakhan (1556) by Ivan the Terrible brought Muslims under Russian control for the first time. For much of the next two centuries,

led to the reception and total absorption of a wide range of words of Arabic and Persian origin, extending well beyond the purely religious sphere. The important concept of traditional (non-Islamic) law and custom, which is seen in opposition to Islamic law, is only known under its Arabic term '*adat*.'

It is interesting, however, that even under the influence of Islam the Indic heritage was not completely suppressed, as is evinced by the survival of a Tamil word such as *lebai* for the mosque official and Sanskrit terms for key Islamic concepts such as the fast – *saum* in Arabic, but Sanskrit *puasa* in most Indonesian languages – and the religious disciple, who is still called a *santri*. Equally interesting is the fact that the planners of modern Indonesian, besides drawing on European languages, turn to Sanskrit rather than Arabic when it comes to the coining of new words and expressions. Islam in the Former Soviet Union

S Akiner, SOAS, University of London, UK; updated by **D Kurzon** University of Haifa, Haifa, Israel

Some 80 million Muslims (2003) live in the territories of the former Soviet Union, a Muslim population second in size only to those of such countries as Indonesia, Pakistan, Bangladesh, and India. Almost all are Sunni (as are the majority of Muslims in general) of the Hanafi school. There are, however, some Shi'ites in Azerbaijan and several thousand Ismailis, followers of the Aga Khan, in the Pamir mountains of Tadjikistan, in the regions adjacent to Pakistan, Afghanistan, and China.

Taken as a whole, the Muslims amount to some 20% of the total population of the old Soviet territories. However, there is considerable ethnic diversity among them. Some 85% are Turkic; of these, the Uzbeks (22.6 million) are the most numerous, constituting the third largest nationality after the Russians and the Ukrainians. Those belonging to the Iranian family account for 8% the Tadjiks (6 million) are by far the largest nationality in this group. The Caucasian family includes such peoples as the Avars, Laks, Lezgis, and Dargis; none very large in size, they speak languages that are almost wholly mutually incomprehensible.

Muslims are concentrated in three regions: in Central Asia (60%), Transcaucasia (20%), and the Volga region and Siberia (20%). Islam was brought to Central Asia and Transcaucasia by Arab invaders in the 7th century, scarcely 20 years after the death of the Prophet. It gradually gained ascendancy, to become in time the dominant force in those societies. The Tatars and Turkicized Mongols of the Golden Horde, who accepted Islam during the 13th and 14th centuries, carried the religion to the far side of the Urals, along the Volga and Siberia; it remained restricted to the tribes of the Golden Horde, however, and did not spread to the Slav population, who remained Christian.

The power of the Golden Horde began to wane during the 15th century, while that of Muscovy grew ever stronger. The capture of the Tatar strongholds of Kazan (1552) and Astrakhan (1556) by Ivan the Terrible brought Muslims under Russian control for the first time. For much of the next two centuries,

the Tatars suffered severe repression and religious persecution. It was not until the reign of Catherine the Great (1762–1796) that matters improved. During this period the community revived. A Muftiat was created in Orenburg in 1788 with responsibility for Muslim affairs. Tatars were granted a number of concessions in both religious and secular affairs; the latter included the restoration of the privileges of the Tatar nobility.

In the 19th century, many more Muslims came under Russian rule. Azerbaijan and the Caucasus were incorporated into the empire in the first half of the century, Central Asia in the second. For the most part, however, the Russian colonial administration interfered little in the everyday life of the indigenous peoples. Muslim institutions continued to function as before. Christian missionary activity was minimal.

When the Bolsheviks took power after the 1917 Revolution, one of their first acts was to reassure the "toiling Muslims of Russia and the East" that their beliefs and customs were henceforth "inviolable." Yet by the end of the 1920s, a fierce antireligious campaign had been launched throughout the USSR. In the Muslim regions, mosques were closed, the Qur'ān and other religious works confiscated, Muslim courts and schools abolished, teachers and scholars killed or imprisoned. The Arabic script, used for centuries by all the Muslims of Central Asia, Transcaucasia, Siberia, and the Volga, the visible symbol of Islam and symbolic link with fellow believers throughout the world, was replaced first by the Latin (1930), then the Cyrillic (1940). These changes of script effectively ensured that all forms of pre-Revolutionary literature, secular and religious alike, became inaccessible to future generations, because, quite simply, they became illegible.

During World War II, the Soviet government adopted a more conciliatory attitude toward religion. For the Muslims, four regional Spiritual Directorates were created, each headed by a Mufti, to administer such manifestations of Islam as were now allowed to reappear. The largest and most important Directorate was seated in Tashkent, the capital of Uzbekistan; its Mufti played the role of unofficial ambassador to Muslim communities abroad, acting as a mouthpiece for Soviet views on such matters as the Arab-Israeli conflict. Two *madrasa* (religious colleges) were reopened for the training of Muslim functionaries (in Tashkent and Bukhara), and public worship was permitted in a small number of mosques. Twenty to 30 carefully chosen representatives were allowed to go on the *hajj* (annual pilgrimage to Mecca); a tiny amount of religious literature was printed. Most of these measures were intended to impress Muslims abroad. They were too limited to have any real effect on the life of Soviet Muslims.

Truly fundamental changes did not come until the late 1980s, when the policy of *perestroika* ('restructuring') resulted in more mosques being opened in 1989 than had previously been allowed over several decades. Extensions to the two existing *madrasa* were sanctioned, and two new ones opened in Baku and Kazan. A new edition of the Qur'ān (50 000 copies) was printed in 1989, and translations into the local languages (Uzbek, Kazakh, etc.) were put in hand. A small but growing number of works on Islam are becoming available to the public at large. The Arabic script is being taught in schools (as an optional subject) and in evening classes; in some republics, there is a movement to have it reintroduced as the national script, in place of the Cyrillic script. In Tajikistan, for example, a law passed in the mid-1990s laid down that the Arabic script be used for writing the Tajik (Tajiki) language, but this law has never been implemented. What has happened is the replacement of the Cyrillic by the roman script. In some of the other republics, e.g., Kyrgyzstan, both Russian and the local language written in the Cyrillic script have been retained as official languages, while in others, e.g., Turkmenistan, Russian has been retained with the local language written in roman script as official languages.

The languages of Soviet Muslims underwent considerable change between the 1920s and the 1990s. Language planning policies were introduced in the 1920s. Consequently, new literary languages were consciously developed on the basis of selected dialects for many large and small ethnic groups. Some Muslim groups had had no standard, unified written form of their languages before this period; for others, such as the Uzbeks, the classical literary medium (Chagatai/Old Uzbek) was replaced by a form closer to the vernacular dialects. Large numbers of Russian loanwords (more accurately, Western European loanwords borrowed through Russian) were incorporated into these languages. In some cases, they introduced new concepts (e.g., in the fields of ideology, administration, Western-style science and technology); in others they replaced existing Arabic/Persian terms (e.g., in Uzbek, Arabic *dorilfunun* was replaced by Russian *universitet* 'university'). Occasionally, old and new forms coexisted as synonyms (e.g., in Uzbek, Arabic *iqtisod* and Russian *ekonomika* 'economy' are used as exact equivalents). Toward the end of the 1980s, a growing sense of resentment against the Russification of these languages became apparent. This heralded a move to reinstate the Arabic/Persian elements, parallel to the move to change the script from the Cyrillic back to the Arabic.

After the disintegration of the Soviet Union, the great problem that faces the leaders of Islam is how

to respond to the changed situation: in the past, their principal concern was to preserve the basic functional framework of the religion: now they are able, and indeed encouraged, to take a more active role in society, to help in its moral regeneration. It is not an easy task. They have yet to come to terms with it.

Islam in the Near East

J N Mattock, University of Glasgow, Glasgow, UK

This article is reproduced from the previous edition, volume 4, pp. 1783–1785, © 1994, Elsevier Ltd., with revisions made by the Editor.

While Islam numbers among its adherents speakers of very many languages, it is dominated linguistically by Classical Arabic (*al-lug͟ha al-fuṣḥā* 'the pure language') to an extent that not even medieval Christianity can be said to have been dominated by Latin. The Qur'ān, as the actual word of God, must be read or recited in Arabic. It is widely disputed whether it is permissible to translate the Qur'ān and thus modify, if not pervert, the divine revelation. Many translations have, of course, been made, by Muslims as well as by non-Muslims, and an English translation was authorized in 1984 by the University of al-Azhar in Cairo, the most widely respected repository of Sunni orthodoxy, but the permissibility of translation remains a live issue. The prayers of the five canonical times must also be recited in Arabic. Only the Friday sermon is generally given in the vernacular in non-Arab communities.

Islam and Classical Arabic – A Symbiosis

It may reasonably be argued that it is the universal use of Arabic for religious purposes that largely sustains the very considerable cohesion of the Muslim brotherhood, bridging as it does the gulf between Sunni and Shi'i Islam, and even that between the Ahmadi movement and the rest. However imperfect a Muslim's command of Classical Arabic may be, it has become, as the medium in which the word of God was revealed, part of his heritage, which is to be revered and cherished.

It may also be argued that to an even greater degree, it is Islam that has, reciprocally, sustained Classical Arabic. The idiom of the Qur'ān is not precisely that of the other surviving literature of its period – the pre-Islamic and early Islamic poetry – or of that of later periods. This is inherent in the doctrine of the inimitability (*i'jāz*) of the Qur'ān. It is, however, closer to the language that has survived, with remarkably little change, to become what is now known as 'Modern Standard/Formal Arabic' than are, for example, most 16th-century forms of European languages to their modern counterparts. It is this language that the Arabs use for writing of all kinds, for formal oral communication – lectures, broadcasts, speeches, etc. – and, to some extent, for communication with speakers of 'dialects' that differ greatly from their own. It is the spoken native tongue of no one, and proficiency in its use varies greatly according to the degree of education of the user.

It is still uncertain what the relationship is between Classical Arabic and the various forms of speech (which are not generally represented in writing) that are familiarly referred to as the Arabic 'dialects,' collectively known in Arabic as *al-lug͟ha al-'āmmiyya* 'the common language,' *al-lug͟ha al-dārija* 'the current language,' or *al-lahajāt* 'the idioms, the dialects.' Traditionally, it has been claimed that these are simply offshoots of the classical language that have become differentiated from it and from one another in the course of time. However, the theory has been advanced that a more complicated process of pidginization and creolization among the non-Arab subject peoples of the Islamic empire should be recognized as having taken place. Whatever the answer, the result has been that these 'dialects' are as different from one another as are the various languages of the Romance group. They are, to all intents and purposes, separate languages and might well already have been

to respond to the changed situation: in the past, their principal concern was to preserve the basic functional framework of the religion: now they are able, and indeed encouraged, to take a more active role in society, to help in its moral regeneration. It is not an easy task. They have yet to come to terms with it.

Islam in the Near East

J N Mattock, University of Glasgow, Glasgow, UK

This article is reproduced from the previous edition, volume 4, pp. 1783–1785, © 1994, Elsevier Ltd., with revisions made by the Editor.

While Islam numbers among its adherents speakers of very many languages, it is dominated linguistically by Classical Arabic (*al-lugha al-fuṣḥā* 'the pure language') to an extent that not even medieval Christianity can be said to have been dominated by Latin. The Qur'ān, as the actual word of God, must be read or recited in Arabic. It is widely disputed whether it is permissible to translate the Qur'ān and thus modify, if not pervert, the divine revelation. Many translations have, of course, been made, by Muslims as well as by non-Muslims, and an English translation was authorized in 1984 by the University of al-Azhar in Cairo, the most widely respected repository of Sunni orthodoxy, but the permissibility of translation remains a live issue. The prayers of the five canonical times must also be recited in Arabic. Only the Friday sermon is generally given in the vernacular in non-Arab communities.

Islam and Classical Arabic – A Symbiosis

It may reasonably be argued that it is the universal use of Arabic for religious purposes that largely sustains the very considerable cohesion of the Muslim brotherhood, bridging as it does the gulf between Sunni and Shi'i Islam, and even that between the Ahmadi movement and the rest. However imperfect a Muslim's command of Classical Arabic may be, it has become, as the medium in which the word of God was revealed, part of his heritage, which is to be revered and cherished.

It may also be argued that to an even greater degree, it is Islam that has, reciprocally, sustained Classical Arabic. The idiom of the Qur'ān is not precisely that of the other surviving literature of its period – the pre-Islamic and early Islamic poetry – or of that of later periods. This is inherent in the doctrine of the inimitability (*i'jāz*) of the Qur'ān. It is, however, closer to the language that has survived, with remarkably little change, to become what is now known as 'Modern Standard/Formal Arabic' than are, for example, most 16th-century forms of European languages to their modern counterparts. It is this language that the Arabs use for writing of all kinds, for formal oral communication – lectures, broadcasts, speeches, etc. – and, to some extent, for communication with speakers of 'dialects' that differ greatly from their own. It is the spoken native tongue of no one, and proficiency in its use varies greatly according to the degree of education of the user.

It is still uncertain what the relationship is between Classical Arabic and the various forms of speech (which are not generally represented in writing) that are familiarly referred to as the Arabic 'dialects,' collectively known in Arabic as *al-lugha al-'āmmiyya* 'the common language,' *al-lugha al-dārija* 'the current language,' or *al-lahajāt* 'the idioms, the dialects.' Traditionally, it has been claimed that these are simply offshoots of the classical language that have become differentiated from it and from one another in the course of time. However, the theory has been advanced that a more complicated process of pidginization and creolization among the non-Arab subject peoples of the Islamic empire should be recognized as having taken place. Whatever the answer, the result has been that these 'dialects' are as different from one another as are the various languages of the Romance group. They are, to all intents and purposes, separate languages and might well already have been

recognized as such but for two factors, which are partly interconnected.

The first of these factors is Arab nationalism. This, although fostered by those who have had an interest in so doing, has never proved particularly powerful and is indeed somewhat specious; the great majority of those who consider themselves Arabs have little enough direct link with the original Arab conquerors of the 7th century. The second is the importance that the Arabic language has for Islam. It is this that has, on the one hand, preserved it virtually in its pristine form and, on the other, given it a status that has caused its offspring to be regarded, even by those who speak them, as inferior. The 'dialects' are referred to in terms of greater or lesser 'purity' according to the degree to which they diverge from the classical norm. That this is attributable to the influence of Islam is suggested by the case of Maltese; here one finds a descendant of Arabic that has developed in an entirely non-Muslim environment over more than seven centuries, has adopted its own Romanized system of writing, and has been recognized as a language in its own right. Elsewhere, non-Muslim speakers of various 'dialects' have formed minorities within territories under Muslim domination.

Classical Arabic, then, is in effect a hieratic language for Muslims, although it is hardly recognized as such by those who consider themselves Arabic speaking. The extent to which the vernaculars are permeated with classical expressions, largely of a religious nature, perhaps tends to disguise the fact. Thus, the frequent citation of verses from the Qur'ān and the Hadith of the Prophet, exclamations such as *al-ḥamdu li-Lāh* 'praise be to God!', *bismi l-Lāhi r-Raḥmāni r-Raḥīm* 'in the name of God, the Compassionate, the Merciful', *a'ūdhu bi-l-Lāh* 'I take refuge in God (i.e., God forbid!)', and even the customary exchange of greetings, *as-salāmu 'alaykum* 'peace be upon you!' – *wa-'alaykumu s-salām* 'and upon you be peace!', in all of which the inflections of the classical language, absent from the vernaculars, are generally retained, strengthen the belief that other features of everyday speech represent a falling short from a classical perfection. On a secular level, the predilection of the educated for quoting medieval classical poetry, in which the inflections are necessary for the meter, also reinforces this. Thus, although Classical Arabic is not a natural medium for them, 'Arabic-speaking' Muslims do not feel it to be so divorced from their own native speech as, for example, Russian speakers regard Old Church Slavonic. For non-Arab Muslims, of course, Arabic is a hieratic language. Since, however, in many cases their familiarity with it is exclusively in a religious context – whether simply as used in worship or also as encountered in the study of secondary theological literature – they may not be in a position to differentiate between 'varieties' of 'Arabic.' In addition, they are disposed to follow the Arabs in regarding 'Arabic' as one language, proficiency in which is attained by different people to different degrees. Thus, although it is to them a hieratic language, it is not one that is equally remote from all believers; their Arab coreligionists have the enviable advantage of possessing it as their native medium of communication.

Other Islamic Languages

There is no documentation extant for the evolution of Pahlavi into Islamic Persian during the first three centuries after the Arab conquest; all Persians apparently wrote in Arabic, even though they presumably still spoke some form of their native tongue. When Persian emerged, it was heavily arabicized. A large proportion of its vocabulary was borrowed directly, and Arabic phrases were also adopted wholesale – not merely pious expressions and other religious idioms, but ordinary secular elements as well. It was at first still possible to use a less arabicized version, as can be seen in Firdawsi's epic the *Shāhnāmah*, in which, since it is concerned with preconquest history, Arabic phraseology would clearly be inappropriate. This, however, appears to have been regarded as deliberate archaizing, and although the *Shāhnāmah* has always remained immensely popular, no subsequent writers followed Firdawsi's example. The degree to which the language of individual authors was consciously arabicized, however, differs greatly; in general, prose is more affected than verse, and the more orotund the style adopted, the more Arabic it appears.

Oddly enough, some items of Persian religious terminology survive, used interchangeably with their Arabic equivalents, and sometimes in preference to these, for example, *namāz* 'prayer' (Arabic *salāt*), *payghāmbar* 'messenger, prophet' (Arabic *rasūl, nabī*), and *Khudā* 'God' (Arabic *Allāh*). Arabic, however, was a dominant influence; sometimes even Persian syntax seems to be approximating to Arabic. Persian and Arabic words were readily compounded, as in *khidmatgar* 'servant' (Arabic *khidma* 'service' + *-gar*, a Persian suffix indicating 'one who does something'), and *dawlat-bar-andāz* 'revolutionary' (Arabic *dawla* 'state' + *bar-andāz*, a participial form from the Persian verb *bar-andākhtan* 'to cast down'); Persian plural endings were attached to Arabic singular nouns, side by side with Arabic plurals, e.g., *ḥālathā* (Persian plural suffix *-hā*, for inanimate objects) and *ḥālāt* as plurals of *ḥāla* 'state/condition' and *ghulāmān* (Persian plural suffix *-ān*, generally for animate beings) and *ghilmān* as plurals of *ghulām* 'boy/slave'.

It appears possible that the Persian word *musulmān* 'Muslim' may have come into existence through a misreading of such a hybrid, *muslimān* 'Muslims' (*muslim* + plural suffix -*ān*), requiring the formation of a further plural *musulmānān*.

The languages that appeared somewhat later on the Islamic scene, such as Turkish and Urdu, borrowed largely from Persian, taking over in the process the Arabic borrowings already naturalized there. Persian itself, from about the 15th century, came to replace Arabic as the principal cultural, if not religious, language of Eastern Islam. It continued to enjoy this position until the last century; of the poetry of Muhammad Iqbal, the celebrated Urdu poet, a sizable proportion is in Persian.

Attempts have been made to 'purify' both Turkish and Persian by replacing the 'alien' elements with 'native' ones. Atatürk's efforts in the 1920s to do this for Turkish had some success; modern Turkish contains a great deal less Arabic and Persian vocabulary than Ottoman Turkish, although much remains, some of it, no doubt, unrecognized as such. The last Shah, Muhammad Reza, became an enthusiastic propagandist for the 'Aryan' character of Persian civilization, and accordingly encouraged the resurrection of Persian terms to replace Arabic; thus, 'agriculture' became *kashāvarzī* instead of *zirā'at* and 'student' *dānish-jū* (literally, 'knowledge seeker') instead of *ṭālib*. How much of this linguistic engineering will survive the Islamic revolution, with its inevitable emphasis on Arabic, remains to be seen. In fact, both the Turkish and the Iranian initiatives may be regarded as moves in campaigns of secularization. In Atatürk's case, the campaign was overt and acknowledged; in Muhammad Reza's case, it was covert, but nevertheless real, consequent upon the opposition that both his and his father's policies of modernization had encountered from the Iranian religious leaders.

The Arabic Script

The Arabic script, with various modifications, was almost universally adopted for other languages of the Muslim world; this remained the case until earlier this century, constituting a further bond between Muslims. The respect in which it was held amounted almost to reverence. The art of calligraphy was highly valued, and the Arabic script, often in highly ornate and fantastic forms, became one of the principal features of all the decorative arts. Poetry abounds in metaphors and similes taken from the shapes of the letters.

It has been retained for Persian, Urdu, and Pashto, all three of which are, of course, the languages of regions in which Islam is particularly strong. With some qualifications, it is reasonably well suited to these languages, although the absence of short vowels means that they cannot be read aloud by someone who does not know them. Turkish abandoned the Arabic script in 1928. It was not well suited to a language with a sophisticated vocalic system, but this reform was also a further step in Atatürk's attempt to diminish the influence of Islam in Turkey; it distanced the newly literate both from the Qur'ān and associated Arabic writing and from the corpus of Islamic Turkish and Persian literature. The modified Latin orthography of modern Turkish works well, but it does tend to disguise the Arabic and Persian borrowings in its reproduction of their Turkish pronunciation: the elements *ajzā'* 'components, drugs' (plural of Arab *juz'*) and *khānah* 'house, shop' (Persian) are barely recognizable in *eczane* 'chemist's shop'; *fevkalâde* 'extraordinary' appears somewhat far removed from its Arabic original *fawq al-'āda*. Kurdish, which is, somewhat distantly, related to Persian, has modified the Arabic script in such a way that short vowels can be represented; this expedient also disguises the shape of the Arabic, Persian, and Turkish elements, but it appears to have had no antireligious origin.

Island Constraints

A Carnie, University of Arizona, Tucson, AZ, USA

The Phenomena

Chomsky (1964) observed that there was a restriction on the family of displacement operations collectively known as A-bar movement or extraction (including topicalization, wh-movement, relative clause formation, and others), such that given two noun phrases (NPs), one embedded inside the other, only the topmost NP can be displaced. Ross (1967) suggested that this phenomenon is part of a larger pattern of constraints on movement that limit movement from certain kinds of constituents. In Ross's terminology, a syntactic constituent that disallows movement from within itself is known as an 'island.' The constraints that govern this behavior are known as 'island constraints.'

As a point of contrast, consider the following pair of grammatical sentences, where the second is taken to be a question version of the first:

(1a) I said [$_{\text{CP}}$ that John wanted [$_{\text{TP}}$ Mary to ask Bill [$_{\text{TP}}$ to bake **a cake**.]]]
(1b) **What** did you say that John wanted Mary to ask Bill to bake *t*?

Movement of the wh-word (*what*) that is the object of the verb *bake* is allowed to cross a large amount of structure. Now consider movement out of a similar sentence, but one where the starting place of the wh-word is in a clause that is inside an NP. Sentence (2) shows an example where the embedded clause is a complement to the noun; sentence (3) shows an example where the embedded structure is a relative clause:

(2a) I concealed [$_{\text{NP}}$ the fact [$_{\text{CP}}$ that John baked **a cake**].
(2b) ??**What** did you conceal the fact that John baked *t*?

(3a) I saw [$_{\text{NP}}$ the man [$_{\text{CP}}$ who baked **that cake**]]
(3b) ***Which cake** did you see the man who baked ***t***?

The sentences in (2b) and (3b) are subject to what Ross called the '*Complex NP Constraint*' (CNPC), and are known as (complex) NP-islands. This constraint simply says that extraction out of a clause within an NP is ungrammatical.

NPs are not the only island, however; Ross observes that any element (including clauses) in subject position is also an island for extraction. This can be seen in (4); (4a) and (4b) show a pair where we are extracting an object out of a tensed clause in subject position. (4c) and (4d) show the same thing with a nonfinite subject clause.

(4a) [$_{\text{CP}}$ That the police would arrest **several rioters**] was a certainty.
(4b) ***What** was that the police would arrest *t* a certainty?
(4c) [$_{\text{TP}}$ To read ***Great Expectations*** in peace] was all he wanted.
(4d) *What was to read ***t*** in peace all he wanted?

This is Ross's *Sentential Subject Constraint* (SSC).

Closely related to the CNPC and SSC is Ross's *Left Branch Condition* (LBC), which restricts movement of an NP that is the left branch of a larger NP.

(5a) I liked [$_{\text{NP}}$ [$_{\text{NP2}}$ **John**]'s friend].
(5b) ***Whose** did you like ***t*** friend?

Finally, Ross also proposed the *Coordinate Structure Constraint* (CSC), which disallows extraction of either member of a conjunction:

(6a) I liked **Mary** and **John**.
(6b) *Who did you like Mary and ***t***?
(6c) *Who did you like ***t*** and John?

In addition to Ross's islands, a number of other island types have been proposed, including negative islands (Schafer, 1995) and wh-islands (Chomsky, 1973). The latter are perhaps the most important kind of island. Wh-islands involve displacement of two wh-elements. One movement is to the front of the embedded clause; the second crosses over the first, and puts the wh-element at the beginning of some higher clause. (7a) represents a declarative clause. (7b) and (7c) show that movements of both the embedded NPs are acceptable independent of one another. (7d) shows that movement of both NPs together results in ungrammaticality.

(7a) Bill said [$_{\text{CP}}$ **Mary** loves **pineapples**.]
(7b) Bill asked [$_{\text{CP}}$ **what**$_i$ Mary loves t_i.]
(7c) **Who**$_j$ did Bill say [$_{\text{CP}}$ t_j loves pineapples.]
(7d) *Who$_j$ did Bill ask [$_{\text{CP}}$ what$_i$ t_j loves t_i]

The Subjacency Condition

In the government and binding theory of the late 1970s and 1980s, an attempt was made to capture all of the island phenomena (or a significant portion thereof) with one formal constraint. The most successful attempt at this came in the form of the *Subjacency Condition* (Chomsky, 1973; Koster, 1978; Rizzi, 1982); this constraint limited wh-movement by specifying dominating categories as ***bounding nodes***. Crossing too many bounding nodes in one swoop

resulted in ungrammaticality. A typical formalization of the subjacency condition is given in (8):

(8) A-bar movement may not cross two or more bounding nodes. Bounding nodes are NP and TP (= S).

In order to see how this accounts for islands, it is worth showing how it allows for long distance wh-movement as in (1). The underlying idea is that movement is *cyclic*. Although the movement in (1) appears to be long distance, it actually happens in shorter hops. Each hop lands in the specifier of a CP. As such, most cases of movement will only cross one bounding node (a single TP). This can be seen in (9) below, where each bounding node is circled. Each step in the movement crosses only one bounding node.

(9a) [$_{CP}$ did [$_{TP}$ you think [$_{CP}$ what$_i$ that [$_{TP}$ Millie said t_i]]]]?

move #1

(9b) [$_{CP}$ What did [$_{TP}$ you think [$_{CP}$ t_i that [$_{TP}$ Millie said t_i]]]]?

move #2

Contrast this with an NP-island, such as (2b), the structure of which is given in (10):

(10) ?? [$_{CP}$ **What** did [$_{TP}$ you conceal [$_{NP}$ the fact [$_{CP}$ that [$_{TP}$ John baked *t*]]]]]?

Successive cyclic movement will allow the first movement of the wh-word to cross only a single bounding node, which is acceptable:

(11) ?? [$_{CP}$ did [$_{TP}$ you conceal [$_{NP}$ the fact [$_{CP}$ what that [$_{TP}$ John baked t_i]]]]]?

move #1

However, subsequent movement to the highest CP specifier will result in a Subjacency violation, crossing both the NP node and the higher of the two TP nodes:

(12) ?? [$_{CP}$ What did [$_{TP}$ you conceal [$_{NP}$ the fact [$_{CP}$ *t* that [$_{TP}$ John baked t_i]]]]]?

**move #2*

A similar account can be given to wh-islands: movement of the first wh-word does not violate the constraint:

(13) *[$_{CP}$ did [$_{TP}$ Bill ask [$_{CP}$ what$_i$ [$_{TP}$ who loves t_i]]]]

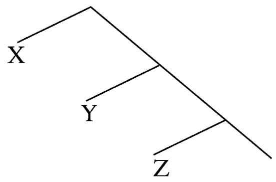
move #1

Movement of the other wh-word will necessarily result in a Subjacency violation, because it will not be allowed to stop in the embedded specifier of the CP (which is occupied by *what*), so it will cross two TP bounding nodes:

(14) *[$_{CP}$ who$_j$ did [$_{TP}$ Bill ask [$_{CP}$ what$_i$ [$_{TP}$ t_j loves t_i]]]]

**move #2*

The subjacency constraint also explains the left branch condition, the sentential subject constraint, and some cases of the coordinate structure constraint (although not all). An important outgrowth of the research into subjacency was the observation that there was crosslinguistic variation in what counted as a bounding node. For example, Rizzi (1982) observed that CPs (S′) and not TPs (S) in Italian were bounding nodes. This kind of observation was influential in the development of casting crosslinguistic variation in terms of narrow parameters.



The Empty Category Principle and the Condition on Extraction Domains

Huang (1982) observed that extraction from adjuncts and specifiers was consistently worse than that of extraction of complements. Huang proposed the *Condition on Extraction Domains* (CED), which limits grammatical extraction to positions that are governed. (Roughly, government corresponds locally c-commanded by a lexical [theta role-assigning] head or by an antecedent.) The heart of this idea is contained in Chomsky's (1981) *Empty Category Principle* (ECP), which requires that the traces of A-bar movement be governed. Chomsky (1986) attempted to unify the ECP, subjacency, and other locality conditions (such as the binding conditions) in a system called *Barriers*. At the time of the writing of this entry, Barriers is widely considered to have been a failure.

Relativized Minimality

Rizzi (1990) first observed that every kind of movement (A-bar movement, A-movement (or NP-movement) and head movement) has some kind of locality constraint on the relationship between the displaced item and its starting position or trace. In each case, the moved item must c-command the position it moves to; and there can be no potential intervening candidate for the element at the top of the movement chain. In other words, given a structure such as (15), where Y and X are of a like type of category (wh-element, or NP or head), then a movement chain formed between X and Z is ungrammatical.

(15)

This differs from previous approaches where what was at stake in locality conditions was the nature of the categories that dominate the trace. Here, what is of relevance is the nature of the categories and positions that c-command the trace.

Island Constraints in the Minimalist Program

The relativized minimality approach has been very influential in the formulation of constraints on island phenomena in the minimalist program. In the earliest versions of the program (e.g., Chomsky, 1994), island effects were captured by making reference to a version of relativized minimality, whereby there are economy constraints that compare derivations of sentences and look for the most economical. One such constraint is *Shortest Move* (SM). This constraint gives preference to derivations where each movement moves to the closest potential landing site. Skipping that landing site (for example, because it is filled with another wh-word) will result in a dispreferred derivation. In later versions of the program (e.g., Chomsky, 1995), SM is replaced by an absolute condition that is part of the definition of the movement operation (known as ATTRACT). This condition is the *Minimal Link Condition*, which for any given landing site always prefers the closest potential filler. Refinements to this approach can be found in Collins (1997), and criticisms can be found in Johnson and Lappin (1999). In the most recent version of the minimalist program (Chomsky, 2000), known as *phase theory*, island effects reduce to the way in which the syntactic tree is derived. Very small, local structures (known as *phases*) are generated piece by piece from the bottom of the tree. Operations may only apply within these phases, or from the topmost position within the phase (the phase edge); this ensures that each step in the movement will be limited to occur either within a given phase or between adjacent phases, giving rise to successive cyclicity.

Approaches to Island Effects in Other Theories

Outside of Chomskyan linguistics, other approaches to syntax have attempted to capture some of the same results. Following the work of Gerald Gazdar (1981) in generalized phrase structure grammar, proponents of head-driven phrase structure grammar (HPSG) make use of the fact that the theory relies on licensing constraints on subtree structures (similar in many ways to the licensing constraints that hold of minimalist phasing). In HPSG, island conditions are at least partly stated as conditions on these licensing constraints. For example, the CSC falls out from the requirement that the rule which licenses coordination stipulates that neither conjunct may contain a gap (see Sag *et al.* [2004] for a textbook treatment, and Johnson and Lappin [1999] for a more in-depth analysis). In lexical functional grammar, long-distance dependencies are expressed in terms of the notion of functional uncertainty, whereby functional relations such as FOCUS (which governs wh-questions) search for a potential variable to satisfy their features. There are conditions on the search, called inside-out constraints, which limit the search space within the f-structure (see Falk, 2001 for an accessible introduction to these ideas). In the functionalist literature, the most common approach is to try to explain subjacency as a processing or memory constraint. For example, Pritchett (1991) suggests that subjacency reduces to the desire of the parser to match up displaced elements and gaps. When too many choices are available, the parser crashes. For a critical review of such approaches, see Lasnik (1999).

Isle of Man: Language Situation

Editorial Team

Official languages on this self-governing crown dependency (estimated inhabitants: 77 655) of the United Kingdom are English and Manx. Manx Gaelic, a Goidelic language, was widely used earlier, but became extinct with the death of its last speaker in 1974. Thanks to a scholarly revival by enthusiasts, Manx has been formally taught in schools since 1992 and is now the second language of several hundred people. Government departments use English and Manx titles on all official documents, correspondence, and vehicles, and Manx is also used on town and road signs and increasingly by commercial businesses.

Isolated Language Varieties

C Dannenberg, Virginia Tech, Blacksburg, VA, USA

The term 'isolation' and its corollary 'mobility' have continued to be key factors in the determination of the actuation, embedding, and trajectory of linguistic change. Although isolation has rarely been studied in and of itself as an independent linguistic variable (Chambers, 1995), dialectologists have been irresistibly drawn to isolated communities (and to isolated speakers for that matter) for their import descriptively and theoretically, since Gauchat's (1905) cornerstone study of the community of Charmey in the Swiss Alps. Such communities yield vital evidence into earlier stages of various dialects, including African American Vernacular English, Appalachian English, and even mainstream American English, to name a few. Additionally, insular and postinsular communities allow for rigorous investigation into language variation and change, particularly with respect to those language communities that are moribund – that is, those that are in danger of dying out within a generation or two. The case of Faetar, a Franco-Provençal dialect spoken in the villages of Gaeto and Celle in southern Italy and historically brought to the region by French immigrants in the 14th century, is such an example of a moribund language variety. Analysis of the phonological system of Faetar, particularly the phonological status of the schwa (absent in standard Italian), has provided rich data on the specifics of how language contact affects each of the languages in the contact situation (Nagy, 2001).

Quite recently, though, the concept of isolation and the assumed affects of isolation on dialect

Isolated Language Varieties

C Dannenberg, Virginia Tech, Blacksburg, VA, USA

The term 'isolation' and its corollary 'mobility' have continued to be key factors in the determination of the actuation, embedding, and trajectory of linguistic change. Although isolation has rarely been studied in and of itself as an independent linguistic variable (Chambers, 1995), dialectologists have been irresistibly drawn to isolated communities (and to isolated speakers for that matter) for their import descriptively and theoretically, since Gauchat's (1905) cornerstone study of the community of Charmey in the Swiss Alps. Such communities yield vital evidence into earlier stages of various dialects, including African American Vernacular English, Appalachian English, and even mainstream American English, to name a few. Additionally, insular and postinsular communities allow for rigorous investigation into language variation and change, particularly with respect to those language communities that are moribund – that is, those that are in danger of dying out within a generation or two. The case of Faetar, a Franco-Provençal dialect spoken in the villages of Gaeto and Celle in southern Italy and historically brought to the region by French immigrants in the 14th century, is such an example of a moribund language variety. Analysis of the phonological system of Faetar, particularly the phonological status of the schwa (absent in standard Italian), has provided rich data on the specifics of how language contact affects each of the languages in the contact situation (Nagy, 2001).

Quite recently, though, the concept of isolation and the assumed affects of isolation on dialect

maintenance and change have come under considerable scrutiny, and this criticism has led to dynamic definitions of isolation itself as well as the formulation of comprehensive principles by which to measure the influence of insular and postinsular communities on language change.

The Concept of Isolation

Categories of Isolation

Sociolinguists use the term 'isolation' to indicate relative degree of separation of a particular language community from surrounding contact varieties. Categories of separation may include (Montgomery 2000: 44–45).

- Physical (involving proximity to other communities, especially towns)
- Sociological (involving the frequency and variety of contact with other communities)
- Economic (involving the exchange of goods, services, and ideas with other communities)
- Psychological (involving the orientation and affinity of one community toward others, attachments to one's own culture, and openness to change)
- Cultural (involving the maintenance of distinctive practices and beliefs)
- Technological

Crucially, these categories are not discrete. In fact, each one may be dependent on, connected with, or reinforced by another. For example, sociological isolation, where speakers are separated in their day-to-day contact from surrounding communities, may be directly predicated by the community's physical remoteness. An example is the community of Smith Island, Maryland, where the islanders are quite socially isolated. Smith Island is not a tourist spot or an ideal place for retirement. Moreover, the island does not attract newcomers who are looking for a place to settle. In fact, the population of Smith Island is declining quickly, down from 650 in 1970 to 350 today. Certainly, the community's physical remoteness has played a role in this social isolation, as it is not and more than likely will never be accessible by bridge from the mainland, and the island is only accessible by day via private ferry service (see more discussion of Smith Island below).

Additionally, a particular community's isolation may be a compound of several factors, such as economic practices as well as access to the media or technology. Or, a group of speakers' psychological isolation might be dependent on the extent of its cultural isolation. Take, for example, the Lumbee Indians of Robeson County, North Carolina, who are discussed in more detail below.

This community of speakers has struggled to maintain a distinctive American Indian culture since the 1835 passage of the Revised State Constitution of North Carolina, which mandated that people of color did not have the rights and privileges afforded those who were white. This legislation effectively deprived the Lumbee of their ethnic identity as American Indians since the Lumbee no longer had a discrete identity in the eyes of the government; instead, they were grouped with other people of color.

Such a classification has had an essential effect on how they have defined themselves in relation to other groups. In an important sense, the Lumbee historically have been caught between whites and blacks, and such an indeterminate status has served to foster a sense of otherness apart from both white and black.

In addition to physical or geographic remoteness, sociological or dense, multiplex networks, and economic autonomy, supplemental classifications of isolation, such as community size and historical continuity have also been offered. Isolated communities, indeed, tend to be small in population size (e.g., a few hundred); however, this is not a categorical qualification. For example, the insular community of Lumbee Indians of Robeson County consists of upwards of 45 000 members.

Further, even though many isolated communities may have had significant out-migration and some in-migration over the course of their histories, the historical continuity of the communities tend to remain constant at their core. Most isolated communities have a central core of members who are able to trace back their family lineage to the local inception of the community. More than that, however, true membership of these isolated communities is often tied to such lineage (i.e., whether a speaker's parents, grandparents, and great-grandparents were raised in the area).

While general categories for isolation are critical in the classifications of insular language varieties, the picture is even more complex. With respect to sociological isolation, for example, it is equally important to investigate the various types of contact that are involved as it is to identify the levels of contact facing an insular community (Schilling-Estes, 2002). So, for example, is the contact related to personal associations (e.g., friends, social clubs) or business or economic factors (i.e., work)? Is that contact passive or active (e.g., one-on-one communication or television); mandatory (e.g., one is required by commitment) or optional (e.g., because of personal choice)? Additionally, where does that contact take place?

Is the contact within or outside of the particular community in question?

Types of Isolated Communities

In addition to the classifications that are associated with isolated communities, there are also varying types of isolated communities. That is, open vs. closed and endocentric vs. exocentric communities. Andersen (1988) maintains that it is not unusual for open communities (e.g., those that allow in-migration) to be attitudinally closed, or for closed communities to be open in terms of a wider view of the world. Endocentric communities, however, tend to remain focused on their own internal norms, whereas exocentric communities may be aware of norms outside of their own community reference. Increasing contact with isolated communities, then, may exacerbate or blur lines of distinction depending on psychological factors (Wolfram, in press). As Andersen (1988: 74–75) states, "It may be primarily an attitudinal shift from endocentric to exocentric which changes the course of development of a local dialect when it becomes part of a wider socio-spatial grouping [i.e., when it becomes more open] and not just the opening up of new avenues of interdialectal communication."

Criticism of the Concept of Isolation

Isolation, in whatever way it is categorized, is not a dichotomous classification. In other words, communities are not simply either isolated or nonisolated. Rather, isolation is relative over time, geography, and social space, even in the most extreme dialectical situations.

However, criticism has been leveled at linguists both from within the linguistics discipline and from outside (e.g., historians of Appalachia – see Montgomery, 2000) pertaining to the validity of isolation as a descriptive classification or as an explanatory tool. Many sociolinguists feel that adequately describing the sociohistorical and sociocultural context of a particular community is enough to satisfy an understood set of qualities related to isolation. However, such *ipso facto* classifications can miss the crucial differences that classify very different sociocultural isolated communities. Take, for example, Tristan da Cunha (Shreier, 2003). The island of Tristan da Cunha is located along the maritime mountain ridge, which divides the Atlantic Ocean longitudinally. The closest settlement to the island is Jamestown, St. Helena, about 1400 miles away. There have been periods in this island's history where there was no mail service at all for at least a decade, and today, while they have more contact with the outside world than they ever had (e.g., satellite telephone, television, Internet), this contact is relatively new – since the mid-1990s.

Such isolation is self-evident for this community and has unique linguistic consequences. For example, *useta* + past tense verb (*I useta came*), is a structure distinctive to this community of speakers, created in the learning process of English in a multicontact community. However, this feature has become a dynamic, surviving construction precisely because of the island's fertile isolation.

Similarly, it has been suggested that the extraordinarily high density of discrete languages in Papua New Guinea is at least partly due to the very rugged terrain and historical isolation of speech communities there. For other communities, such as Appalachia, where mountainous regions and pockets of remoteness less clearly separate its speakers from surrounding language varieties, though, such descriptors of isolation may be deceptive and assume a solidarity of the region and stagnancy of the language that does not exist.

Those in favor of rigorously re-investigating the properties of isolated communities assert that sociolinguists have fallen into a trap of treating all isolated communities as the same without regard to the situated context of those communities within the wider scope of language contact. In other words, linguists have not typically asked the question of isolation as compared to what? Why should one community be more isolated than another? Furthermore, under close examination, are all those communities labeled as isolated truly that isolated after all?

Despite critical investigation into the premise and usefulness of isolation as a linguistic construct, however, the role of isolation (or conversely mobility) in dialect development, maintenance, and change has been continually reinforced in a wide array of research.

The Role of Isolation in Language Change

Two principles have historically worked together to situate and describe isolated dialect situations. They are the founder principle and the relic assumption. The founder principle (Mufwene, 1996, 2001) maintains that the linguistic characteristics of a particular speech community are determined by the language that was originally brought into the region. Thus, Appalachian English, for example, is strongly influenced by the language(s) of its original inhabitants (e.g., the Scots-Irish). Likewise, in the case of African American Vernacular English, the issue of donor dialects is still under considerable investigation. The relic

assumption (Andersen, 1988) presumes that isolated dialects will be conservative in their trajectory of linguistic change and will actually remain relatively unchanged after they are clearly formed.

Although there is undeniable and copious support for both of these principles, emerging evidence of isolated communities dampens the principles' associated underlying assumptions:

1. that isolated communities are stagnant with respect to change;
2. that as isolated communities come into contact with surrounding varieties, those communities' distinctiveness disappears;
3. that isolated communities progress on the same trajectory of language change in the midst of outside contact.

The Study of Lumbee English Perfective *Be*

The example of Lumbee English perfective *be* – that is, forms of *be* that are used in aspectual contexts where current varieties of English typically use the perfective form *have*, as in sentences such as *I'm been there before* for *I've been there before* or *You're got my number* for *You've got my number* – yields strong contradiction to the assumptions that isolated communities are stagnant and that they lose their distinctiveness as language contact increases.

The Lumbee Indian Community of Robeson County, North Carolina, have lived in a tri-ethnic situation for close to two centuries with African and Anglo-Americans in Robeson County, NC, located in the southeast corner of North Carolina along Interstate 95 by the South Carolina border.

The county's ethnic populations are near equal proportions, with the Lumbee comprising the largest population of upwards of 45,000. Although no one knows the exact relationship between these three ethnic groups in the earliest contact of the county area, we do know that for well over a century, the ethnic groups have remained separate and distinct. *De facto* segregation exists even beyond the most recent effort to integrate the groups, which involved the desegregation of the county schools in the early 1970s.

The ancestral languages(s) of the Lumbee – as with many American Indian peoples – is unrecoverable: there are no vestiges of American Indian source language features in their current variety of English. Sociohistorical and archaeological evidence does, however, suggest that northern Iroquoian (primarily Tuscarora), Siouan, and Algonquian languages may have had a formative influence. Indeed, it is quite possible that the Lumbee are descendants of a multitribal and/or multiethnic contact situation rather than members of one exclusive native tribe.

Reportedly, the Lumbee were speaking English in their first contact with European immigrants who began inhabiting the Robeson County area around 1730. Where the Lumbee learned their English is still a matter of speculation. Highland Scots (who migrated along the Cape Fear River and spoke varieties of Scottish Gaelic and English) and Ulster Scots (who filtered down into the Piedmont of North Carolina from Pennsylvania and Virginia and spoke a Scots-Irish variety of English) were the principal European language groups of the Robeson County area. However, African-Americans – reportedly brought into the area as slaves by the European groups – were also a significant group in the county.

The current language profile of the Lumbee demonstrates selective alignment of language features with regional and ethnic contact varieties of English, such as general Southern, Appalachian English, and African American Vernacular English. At the same time, however, the Lumbee maintain a few relic features that reflect earlier versions of their English contact varieties. One such feature is perfective *be*.

Perfect *be* is exclusively used by the Lumbee in the context of Robeson County, making the form a localized marker of ethnicity for this group. The use of perfect *be* is widespread in the Lumbee community, spanning all age groups, including both the perfect uses of *is* and *are* (Dannenberg, 2003).

The perfect uses of *be* do not appear to be lexically restricted to co-occur with specific verbs or restricted to particular phonological contexts. Syntactically, perfect *be* may appear in an assortment of contexts, including in embedded clauses (e.g., *I don't know whether I'm still got it or no* or *When you got people, you're got resources*), which demonstrates its flexibility. At the same time, however, perfect *be* is syntactically obligated to occur immediately after the subject in its conjugated forms, and that subject tends to be the first person singular pronoun *I*. Although perfect *be* does, albeit rarely, occur with noun phrases as with other pronominal subjects, such as *we* and plural *you*.

Perfect *be* is a robust form in Lumbee English. Thus, it is not surprising that there are extended and analogous uses of *be* in this variety. For example, there are instances where the perfect *be* actually marks as simple past construction, as in *That's what we're called it, Baby Ruth* – i.e., *That is what we called it when we were little*. In addition to the simple past context, there are also cases where the nonconjugated form of perfect *be* is used in perfect and

simple past constructions, as in *He don't know I be went up to the courthouse and took me some papers out on him* and *I told her don't get it cause Mama be got it*, respectively. Lastly, there are cases of perfect *be* where a hypothetical and/or counterfactual context is marked. For example, when the construction, *They be take their honeymoon there* was uttered, the couple had not married yet, nor had they decided a honeymoon destination. In another example, *We bout be bought all of them for $50 dollars*, the buyers had not actually purchased the items for the sum listed.

Perfect *be* for Lumbee English is a relic form, a retention of an earlier form offered by early contact varieties of English, but relic, here, does not connote static. Indeed, the case of perfect *be* reflects the complexity of a language system as it has configured and reconfigured itself over time.

The Study of Smith Island, Maryland

As the case of Lumbee use of perfective *be* disputes the notion that isolated communities are stagnant with respect to language change, so does the case of Smith Island. Smith Island is located off the coast of Maryland, approximately 10 miles from the mainland Delmarva Peninsula. Schilling-Estes (2002) reports that the island is only accessible by day via a private ferry service, and that the community is largely homogenous. The historical continuity of the residents of Smith Island is also indisputable, with many residents able to trace back their family's lineage to the 1600s. Moreover, Smith Island residents have been able to subsist autonomously in maritime-related activities, although that is changing at present. At the same time that residents are being forced to seek jobs outside of the community (and off the island), the islanders "continue to remain highly focused socially and attitudinally on their local ties" (Schilling-Estes, 2002: 66). Islanders, who sought a high-school education, at one time stayed on the mainland during the school week, as there was no high school on the island. Today, the children are being shuttled to and from the mainland for school on a daily basis.

Smith Island is by all classifications an isolated community, even though current islanders are coming into more and more contact with mainlanders, and in their 1999 study, Wolfram and Schilling-Estes examined two variables in order to demonstrate the level of change in the community over time. The two variables in question were raised /ay/ (as in r*oi*ght for r*i*ght) and glide-fronted /aw/ (as in s*ai*nd for s*ou*nd) (Wolfram *et al*., 1999).

Investigating generational uses (those born between 1899 and 1932, those born between 1942 and 1961, and those born between 1965 and 1971) of both variables from interviews conducted in 1983, Schilling-Estes and Wolfram found that both the raised /ay/ and the glide-fronted /aw/ had increased quite significantly over the three generations. Crucially, they found that these variables actually increased when used in the younger generations; in fact, older speakers had low levels of these features. Thus they concluded that raised /ay/ and glide-fronted /aw/ were not relic features, retained from earlier vestiges of the language, but rather innovative uses that demonstrated dialect concentration rather than dissipation as this community came into more contact with surrounding mainland varieties.

This pattern of concentration holds true for Smith Island with respect to morphosyntactic variables as well. An example is the past *be* paradigm (that is, for negative contexts, leveling to *wasn't* or *weren't* as in *I wasn't/weren't there* and for positive contexts, leveling to *was*), examined in Schilling-Estes (2002). The data illustrate that there was a complete shift of *wasn't* and *was* leveling from the earliest generation studied, where the be paradigm use reflected the typical pattern of usage in vernacular American varieties, to the third generation, where there was categorical *weren't* use for negative contexts (that is, 100%) and some regularization to *was* in positive contexts (22%). As Schilling-Estes (2002) reports, gender differences in the uses of past *be* exacerbate the differences between the generations. In fact, although it took women three generations to switch to categorical usage of *weren't* in negative contexts, the men reached the shift in only two generations. This rapid shift from one usage to the next for male Smith Islanders may be tied to outside contact: men had wider networks than women on the island.

Thus, with the case study of Smith Island, we have further seen that isolated communities can indeed be quite innovative and dynamic with respect to language change. Moreover, in the case of the Lumbee and Smith Island, we have also seen that communities can remain distinctive, even in the face of language encroachment. The Lumbee have selectively carved out a distinctive niche in the context of a tri-ethnic environment and successfully negotiated their identity over time and social space with respect to perfect *be*. Smith Islanders have not only remained unique in the midst of increasing contact with outside communities, but have actually increased their distinctiveness through the concentration of phonological and morphological features. But what do we make of the other assumption that isolated language communities progress on the same trajectory of language change in the midst of outside contact? As the case studies of African American Vernacular English in

Beech Bottom and Hyde County, North Carolina, directions of language change in isolated communities can be quite disparate. Focusing on these two separate case studies in North Carolina highlights that even in a specific geographic region, trajectories of language change may be quite different.

The Case of Hyde County, North Carolina

Hyde County, North Carolina, is located on the eastern seaboard of North Carolina and encompasses coastal mainland as well as the Outer Banks barrier islands. Mainland Hyde County, the geographical region of the study is a long-term biracial community that has been historically one of the lowest populated counties in the state. Currently, there are more than 5000 residents in the county. The terrain of the county is marshy wetlands and the county has been socially detached – in fact, many African adults interviewed reported that they had not left the county until adulthood. In their 2002 investigation into the properties of African American Vernacular English (AAVE) use in Hyde County, Wolfram and Thomas (2002) examined several features well-documented in other studies of AAVE as well as European contact varieties in the Pamlico dialect area in order to situate Hyde County AAVE within regional and wider contact norms. They examined r-lessness (e.g., *cah* for *car*), several phonological variants – including /ai/ (*tide*), /au/ (*house*), /o/ (*boat*), /u/ (*boot*), /e/ (*day*), /ɔ/ (*bought*) – third person s-marking (*The dogs barks*), copula absence (*She going nuts* or *They going nuts*), and past tense *be* regularization (negative *weren't* and positive *was*).

Analysis of each of these features shows a mixed alignment. Clearly, older African-Americans within the county tend to align with their European American cohorts in the county. Older African-American speakers' rates of postvocalic r-lessness and the vowel systems of the speakers solidify this alignment. At the same time, though, younger speakers within the county appear to be moving away from the more traditional vowel systems and aligning with the wider AAVE norm, even though they still show vestiges of the local norm. For example, r-lessness is on the increase from the older generations to the younger generations, but the youngest group still has lower frequency of r-lessness as compared to general AAVE. Moreover, fronted /o/ among younger African-American Hyde County speakers continues to mark them as separated from other AAVE communities.

With respect to the morphosyntactic variables, the alignment is less clearcut. The use of verbal -s, where typically third person -s attaches to plural subjects that tend to be noun phrases as opposed to pronominals, indicates that elderly African-American speakers preferred verbal -s attachment, regardless of subject type, while Hyde County European speakers followed the general pattern, selecting verbal -s with noun phrases. The absence of verbal -s on third person verbs is a well-established descriptive feature in general AAVE. The contrast between European and African-American speakers with respect to this feature is quite clear. All generations of African-American speakers in Hyde County regularly delete third person -s where European American speakers do not.

Copula absence delineates a similar pattern. Among African-American speakers, we would expect a high rate of the copula with *is* as well as a high rate with *are* as per the typical pattern of copula absence in AAVE. Further, we would expect that European American speakers would have some *are* absence, while we would not expect *is* absence. Wolfram and Thomas (2002) report that African-American copula absence in Hyde County is distinctive to that group. Indeed, European Americans in the county do not even have copula absence to a limited degree.

Leveling to *was* and *weren't* in Hyde County patterns are much the same as the above phonological variables. Older African-Americans level to *was* in positive contexts and *weren't* in negative contexts, mirroring European contact variety norms. However, young African-American speakers level to *was* in both positive and negative contexts, much more in line with current varieties of AAVE.

The case study of Hyde County illustrates that in this isolated community, younger African-American speakers are aligning with an outside norm, diverging from their European American cohorts in the region. This trajectory of change is quite different from another African-American community of Beech Bottom, North Carolina.

The Case of Beech Bottom, North Carolina

Beech Bottom is a very small community of self-reported multiethnic speakers (speakers claim European and mixed African-American, European American, and American Indian status) in the southern Appalachian mountain range in Avery County. The community is geographically detached from larger towns and cities and the mountainous terrain hinders access to locations outside of the immediate region. The community is closely knit, and there are only a half-dozen long-term residents of the area. The isolation of this community is certainly without question.

Like the Hyde County study, the investigation of Beech Bottom examines several variables in order to situate speakers within the wider context of local and regional contact norms. Among those features studied were 3rd person plural -s absence and attachment, copula absence, copula absence and past tense *be* regularization, consonant cluster reduction (as in *wes*' for *west*), r-lessness, /ai/ glide reduction (as in *tahm* for *time*), and an overall analysis of the vowel system of representative speakers.

Overall with respect to -s attachment, (Mallinson and Wolfram, 2002) reports that African-Americans and European Americans basically are aligned. Although there are subtle differences in some constraint orders, it appears that -s attachment is declining for both groups over time. At the same time -s attachment demonstrates alignment, 3rd person -s absence illustrates ethnic disparity among the older generations: older European American speakers have a low rate of absence while older African-American speakers have much higher rates of absence. Younger generations of African-American speakers, however, appear to have much lower rates of absence, suggesting a movement toward the local European American variety.

Past *be* also indicates alignment between the groups, with both leveling to *was* in both positive and negative contexts, which is typical of the Appalachian region. Further, regarding r-lessness, the groups are quite similar – that is, both have a high incidence of rhoticity, and both groups reduce the glide on /ai/, both of which are also characteristic of Appalachian varieties.

Conversely, copula absence illustrates dissonance between the groups: African-Americans show much higher rates of absence that their European cohorts. The same holds true with consonant cluster reduction where there is a strong ethnolinguistic divide between the European American and the African-American speakers.

Thus, in this isolated, dwindling community of speakers, African-American speakers are moving toward local European American norms. This movement is clearly contradictory to the Hyde County example, where African-American speakers are on a path of change toward wider AAVE norms. In two isolated communities, then, there are very disparate trajectories of change in the face of contact and change.

Accounting for Relative Variation of Isolated Communities

With obvious differences in the patterns of language variation, maintenance, and change from one isolated community to another, are there common properties that sociolinguists can draw on with respect to concepts of isolation and its effect on language change? Toward an understanding of the complexities and relativity of the concept of isolation, Wolfram (in press) outlines seven principles that may apply to isolated dialect communities:

1. The Principle of dialect exclusion. This principle is designed to account for those dialects that are separated from continuing dialect diffusion among socially dominant groups. Through exclusion, such isolated dialects may have selective retention of features and/or independent language change.
2. Principle of selective change. Under this principle, dialects may exploit dialect structures that may result in divergence. These dialects may be conservative with respect to change or the changes could be accelerated.
3. Principle of regionalization. While independent language change takes place in peripheral dialect communities, isolated dialects may converge with or diverge from other isolated dialects as well as from core dialect communities. This process leads to regionalization.
4. Principle of social marginalization. This principle states that when nonmainstream dialects are marginalized, then those dialects occupy a low status in comparison to socially ratified dialects. Thus, the features of those dialects will be socially stigmatized.
5. Principle of vernacular congruity. There are natural linguistic properties, such as analogical leveling, regularization, and generalization that facilitate language change. Given that those communities that are socially disenfranchised will presumably have less pressure to preserve irregular structures that are socially preferred, such change may unite otherwise disparate communities.
6. Principle of peripheral community heterogeneity. This principle suggests that small communities are quite heterogeneous with respect to intracommunity variation. Such variation may be correlative of the specified ethnic or social boundaries of the community, or the variation could be a result of systematic individual variation. Regardless, small communities can tolerate substantial, long-term variation.
7. Principle of localized identity. Above all, speakers tend to embrace distinctive symbolic tokens of local identity, resulting in the perpetuations of dialect features beyond the enclave community. This perpetuation may be in the form of dialect focusing or intensification.

Isolated language varieties are complex entities of sociolinguistic study. How to precisely identify, categorize, and systematize these kinds of communities of study is still a matter of considerable debate. Out of this debate, however, have come several clear classifications of what isolated dialects actually are and formative principles by which to measure the efficacy of isolated communities as areas of study. Despite controversy along the way, isolated language varieties are the window into lingering questions pertaining to language actuation, embedding, maintenance, and change.

Israel: Language Situation

M Amara, Bar-Ilan University, Ramat-Gan, Israel

In 2003, the population of Israel was 6 748 400 (77% Jewish, 19% Arabs, and 4% other minorities). About half of the Jewish people are Ashkenazi and half are Sephardi. The literacy rate is 95% (population percentage over age 15 with ability to read and write). Israel is a highly multilingual country. The *Ethnologue: languages of the world* (see Grimes, 2000) lists 36 languages for Israel; of these, 33 are living languages and 3 are extinct. Israel is a country based on immigration, which partly explains its language diversity.

Hebrew and Arabic are the two official languages of Israel. It is estimated that 4 500 000 Israelis have functional competence in Hebrew, as opposed 2 000 000 who are competent in Arabic (Spolsky and Shohamy, 1999). Hebrew is the dominant language in all walks of life. It is taught as a mother tongue in most of the Jewish schools (except in some ultra-orthodox schools, where Yiddish is the language of instruction) in all stages of education. Hebrew is also learned by all of the minorities as a second language from the 3rd grade on. Modern Hebrew is the national language of the Jews.

Israel is a country based on immigration, therefore the dialects in Israel depend on the origin of parents, and not on geographical location. Israelis who came from Oriental countries before or during the 1950s spoke a distinctly Sephardic (Oriental) variety of Hebrew. However, most second- or third-generation Israelis from these origins shifted to the Ashkenazi Hebrew, so that the Oriental dialect is disappearing except as a socially marked variety.

Arabic is the mother tongue and the main national language of more than 1 million Arab citizens of Israel. Arabic is likewise a community language of hundreds of thousands of Sephardic Jews. Arabic in Israel is a minority language and is legally recognized as a second official language. Arabic is taught as mother tongue in all Arab schools in Israel, from the 1st to the 12th grades, and in several institutes for teacher training. It is also learned by hundreds of thousands of Jews as a foreign language (Amara, 2002; Amara and Mar'i, 2002).

Though Hebrew and Arabic are recognized official languages in Israel, the state of Israel and its society are not publicly bilingual. The status accorded to Arabic in Israeli law is still devoid of any practical significance in Israeli public life. For all intents and purposes, Hebrew is virtually the only language of Israeli civic life. By and large, this is the language in which the Israeli public domain 'speaks'. It is the language of bureaucracy, of higher education, and almost exclusively of the domestic electronic media, and, most importantly, it is the language of those sectors of the labor market that are open to the minority population. The main significance of the status of Arabic in Israel appears, then, not in regard to the society as a whole, but to be the extent of the protection it affords to the internal life of the minority population, especially in regard to the right to education in the minority tongue (Saban and Amara, 2002).

English is the most commonly used foreign language in Israel. It is spoken in both public and private domains (e.g., higher education, electronic media, street signs, and shop signs). The country's laws are also published in English translation, with some delay. English is a compulsory subject from the 3rd or 4th grade on. English is the mother tongue of more than 100 000 Israelis. French is taught optionally as a second foreign language from 5th to 12th grades. Because of the special status of French in the world for political, commercial, social, and cultural reasons, French may be chosen as the second language in place of Arabic.

Immigration remains a major influence on the Israeli language landscape. Recent immigrants, mainly the million Russians and 75 000 Ethiopians, still use their immigrant languages in the home and in the immediate neighborhood. Russian is offered as an optional language for new immigrants through the system. Many established immigrants maintain their own languages (e.g., Polish, Romanian, French, German, Arabic, or Turkish) in their homes and in community settings.

The many Jewish languages that flourished in the Diaspora (such as Ladino, Yiddish, and Judeo-Arabic, with many varieties) are losing ground to the dominant language of the country. Except for Yiddish, maintained in some ultra-orthodox communities, Jewish languages are disappearing in Israel.

In addition to Arabic, which is the major minority language, several minority languages used by non-Jews are reported in Israel. The prominent ones are Armenian, Domari (Nawari), and Adyghe.

Non-Israelis, tourists, and foreign workers (e.g., Thai, Chinese, Filipino, and Romanian) use their own languages, and when they cannot use them or Hebrew, they try to use English as a substitute. Pidginized Hebrew is reported among foreign workers (Elhanan-Granik, 2001).

Italian

A L Lepschy and G Lepschy, University College London, London, UK

Italian is the official language of the Republic of Italy. It is spoken in Italy (including the Republic of San Marino and the Vatican City), and outside Italy, in the Canton Ticino (it is one of the official languages of the Swiss Confederation) and, with different degrees of vitality, in areas such as those of Nizza, the Principality of Monaco, Corsica, Istrian and Dalmatian towns, and Malta. It also survives in Eritrea, and where there are large communities of Italian emigrants, particularly in the United States (about four million speakers), and in Canada, Argentina, Brazil, and Australia (about half a million each).

Number of Speakers

The inhabitants of the Italian Republic numbered about 57 million in 2002. The number of speakers of Italian is, however, more difficult to establish, mainly because there is no simple way of relating the use of the Italian language with Italian ethnic origin or cultural allegiance, in the case of emigrants, and even with Italian citizenship in the case of the residents of Italy. For the latter, the problem is posed not so much by the linguistic minorities within the boundaries of the Italian republic (speakers of German, ca. 280 000, mainly in South Tyrol; of Occitan and Franco–Provençal, ca. 115 000; of Slovene, ca. 53 000; of Serbo–Croatian, ca. 3000; of Albanian, ca. 100 000; of Greek, ca. 30 000; of Catalan, ca. 15 000), but rather by the presence of the so-called 'Italian dialects.'

Genetic Relationships

The term 'dialect,' in the Italian tradition, is used to refer not to different varieties of the same language but, rather, to 'siblings' of Italian. Italian is based on the literary Tuscan (more specifically Florentine) of the fourteenth century. This in turn derives from Spoken Latin and is therefore a Romance language. But Latin during the period from the sixth to the ninth century gave origin, in Italy, to a myriad of Romance languages, which can be classified into over 15 major groups (broadly coinciding with the Italian regions) such as Piedmontese, Lombard, Venetian, Ligurian, Emilian, and so on. These Italian 'vernaculars', in Italian 'volgari' (a term used to designate the living languages, in the Middle Ages, as opposed to Latin, which was no longer native to any group of speakers, but was the standard written language) in their modern forms constitute the Italian dialects (Sardinian and Friulian are sometimes classified as Italian dialects, sometimes as separate Romance languages). The differences between these dialects can be very pronounced. Speakers of Bolognese and of Neapolitan find each other's dialects as unintelligible as would, say, speakers of French and Spanish.

Genetic Relationships

The term 'dialect,' in the Italian tradition, is used to refer not to different varieties of the same language but, rather, to 'siblings' of Italian. Italian is based on the literary Tuscan (more specifically Florentine) of the fourteenth century. This in turn derives from Spoken Latin and is therefore a Romance language. But Latin during the period from the sixth to the ninth century gave origin, in Italy, to a myriad of Romance languages, which can be classified into over 15 major groups (broadly coinciding with the Italian regions) such as Piedmontese, Lombard, Venetian, Ligurian, Emilian, and so on. These Italian 'vernaculars', in Italian 'volgari' (a term used to designate the living languages, in the Middle Ages, as opposed to Latin, which was no longer native to any group of speakers, but was the standard written language) in their modern forms constitute the Italian dialects (Sardinian and Friulian are sometimes classified as Italian dialects, sometimes as separate Romance languages). The differences between these dialects can be very pronounced. Speakers of Bolognese and of Neapolitan find each other's dialects as unintelligible as would, say, speakers of French and Spanish.

History

External History

Literary Florentine, as used by the great Tuscan writers of the fourteenth century, Dante, Petrarch, and

Boccaccio, was gradually accepted as the national standard language and finally codified as such at the beginning of the sixteenth century. The '*Questione della lingua*' (question of the language) was a central concern for the culture of the time with ideological and political, as well as linguistic and literary, implications. Against the proposers of contemporary Tuscan, and of a supraregional '*lingua cortegiana*' (language of the courtiers), the solution that prevailed was the one defended by the Venetian humanist, Pietro Bembo. The model he upheld was archaic Tuscan, which did not imply subservience to any of the rival modern political powers in Italy and was consistent with the principles of classicism and imitation then prevailing.

This had important consequences for the linguistic history of Italy. On the one hand Italian appears to be exceptionally 'conservative': it must be almost unique, among modern national languages, in having changed so little through eight centuries of documented history, and in allowing a twentieth-century reader to approach thirteenth-century Tuscan texts with minimum effort. On the other hand (and this is perhaps the condition for such stability) this language remained a standard written model, accessible only through literacy, like Latin, rather than acquired as a native language. The vast majority of the people, who were illiterate, did not have access to the literary language, and in speech used exclusively their native dialect. It has been calculated that at the moment of political unification in 1860 the number of the inhabitants of the country who could use Italian was at most about 10%, perhaps as low as 2.5%. In 2005, after 145 years of existence of a unified Italy, Italian was assumed to be known to all Italians, but statistics indicated that almost one-half of the population still preferred to use a dialect rather than the national language.

Internal History

The main points to be mentioned in the change from Latin to Italian include the following.

Phonology The opposition of long and short vowels in Latin was replaced by a distinction determined by stress and syllable structure: long vowels are obligatory in free stressed nonfinal syllables, short vowels in other conditions (i.e., in checked stressed, free stressed final, and all unstressed syllables). In stressed syllables the five Latin vowel qualities became seven, with long *ē* and *ō* giving midhigh [e] and [o], short *Ĕ* and *Ŏ* giving midlow [ɛ] and [ɔ] (these broke into [jɛ] and [wɔ] in free syllables). In unstressed syllables only five vowels are used: [i], [e], [a], [o], [u]. The consonant system undergoes the following main changes: assimilation (e.g., [kt] > [tt], as in *factum* > *fatto*); palatalization and assibilation before front vowels (as in *cenam* [keːnam] > *cena* [tʃena]); *hodie* > *oggi*, *medium* > *mezzo*); sonorization, which applies unsystematically, as in *stratam* > *strada*, but *amatam* > *amata*. Initial *h* and final consonants (apart from nasals and liquids in proclitics: *un*, *per*, *il*, etc.) are dropped.

Morphology The case system of the Latin declension disappears and prepositions are used instead: *di uomo* replaces Latin *hominis*. The neuter gender disappears. The Latin verb pattern is basically preserved, with the introduction of 'analytical' or compound forms for the passive (*è amato* for *amatur*), the future (*amare ho*, whence the new synthetic *amerò*, for *amabo*), the perfect (*ho amato* for *amavi*, although this survives as *amaï*), and so on.

Syntax The freedom of Latin word order is reduced, as syntactic function is signaled by linear position rather than case endings: for 'Paul saw Peter' the only normal and unequivocal structure in Italian is '*Paolo vide Pietro*,' whereas in Latin *Petrum Paulus vidit* would be equally clear in any of the six theoretically possible combinations of these three words.

Written Records

The first dated text in an Italian vernacular is found in the account of a court case in Campania in the year 960 A.D. (the *Placito capuano*). The original record in Latin has been preserved; it includes the statement repeated by some witnesses in the vernacular: *sao ko kelle terre per kelle fini que ki kontene trenta anni le possette parte sancti Benedicti* ('I know that those lands within those boundaries which here are contained, for 30 years the party of St Benedict owned them'). Several, mostly short vernacular texts, are found subsequently until the thirteenth century, when 'Italian' literature proper begins, with religious compositions, the poetry of the Sicilian School, and finally Tuscan poetry.

The vernacular must have been used in speech for a long time before the document of 960. There are several texts that appear to represent an attempt to fix in writing a kind of vernacularized Latin by lowering it toward the spoken language, or raising the latter to conform to the conventions of written Latin. One of the best-known documents of this 'compromise' is a riddle apparently jotted down in Verona, at the beginning of the ninth century on a page of a prayer book; it refers to the act of writing, under the guise of describing the work of a farmer: '*se pareba*

boues alba pratalia araba & albo uersorio teneba & negro semen seminaba' (a plausible rendering, among many which have been proposed: 'he was driving oxen, he was plowing white fields and he was holding a white plow, and he was sowing black seed'); some features appear more Latin than vernacular (e.g., *-b-* for *-v-* in the imperfects, final *-n* in *semen*, etc.); others are more vernacular (e.g., fall of final *-t* in the imperfects, *e* in *negro*, etc.). However, many traits present in dialects are attributed to the substratum of pre-Latin idioms spoken in Italy at the time of Romanization. For instance, a Neapolitan feature such as *-nn-* for *-nd-* belongs to Oscan and is found in the Latin graffiti of Pompeii, preserved under the ashes from the eruption of Vesuvius in 79 A.D. This, however, does not entitle us to suggest that Neapolitan was spoken in the first century A.D.

Writing System

The Italian writing system derives from the Latin one. It uses the Roman alphabet as it was adapted for the vernacular during the Middle Ages. Palatalization created some problems, which are solved in the Italian spelling conventions, by using – in front of *i* and *e* – *c*, and *g* for the palatals [tʃ] and [dʒ], and *ch* and *gh* for the velars [k] and [g]. But the system does not render all the oppositions of Tuscan phonology. In particular there are individual letters that correspond to contrasting sounds: *e* to [e] and [ɛ], *o* to [o] and [ɔ], *s* to [s] and [z], *z* to [ts] and [dz]; the last two alveolar affricates, which are always long intervocalically, are represented in spelling sometimes by *z* and sometimes by *zz*. These points leave a trace in the history of the language. As Italian was adopted as a national language in its written rather than spoken form, it became established, in different parts of Italy, with phonological counterparts, for these 'ambiguous' letters, which may be different from the Tuscan ones. Considering that contemporary Tuscan does not constitute an undisputed standard, Tuscan pronunciations like *b*[ɛ]*ne*, *ca*[s]*a*, or [ts]*io* are not felt, in present-day Italian, to be more correct than Northern ones like *b*[e]*ne*, *ca*[z]*a*, or [dz]*io*.

Individual Characteristics

Among the Romance languages Italian would appear to be typologically more similar to Spanish than to French.

For syntax, one frequently noted feature is that it is a 'pro-drop' language (i.e., it does not need to express the pronominal subject of a verb and that, consistently, it can put the subject after the verb). The adjective has two positions: postnominal if it is restrictive, and prenominal otherwise.

Morphology is conservative within a traditional Indo–European pattern; adjectives, nouns and verbs are subdivided into classes, without apparent semantic justification. An adjective may behave like *ross-o* (MASC SG), *ross-a* (FEM SG), *ross-i* (MASC PL), *ross-e* (FEM PL); or like *verd-e* (MASC and FEM SG), *verd-i* (MASC and FEM PL); or like *par-i* (MASC and FEM SG and PL). A noun may behave like *la cas-a* (FEM SG) *le cas-e* (FEM PL); or *il poet-a* (MASC SG) *i poet-i* (MASC PL); or *il libr-o* (MASC SG), *i libr-i* (MASC PL), and so on. A verb may behave like *cant-are*, or *ved-ere*, or *dorm-ire*. Each conjugation has a vast array of different forms according to person (*canto*, *canti*, *canta*), number (*canta*, *cantano*), tense (*canto*, *canterò*, and, with aspectual distinctions, *cantava*, *cantò*), and mood (*lui canta*, *che lui canti*). There is a complex pattern of agreement for gender and number that involves nouns, articles, adjectives, and past participles: *è arrivata una ragazza alta, è arrivato un ragazzo alto*. A notable feature in Italian derivational morphology is the productivity of evaluative suffixes (often called 'alteration'): the following forms are based on *libro*: *librone, libretto, librino, libruccio, libraccio*, etc.

Phonology

The rhythm of Italian is syllable timed. There are seven vowels, very similar to the cardinal ones: /i/, /e/, /ɛ/, /a/, /ɔ/, /o/, /u/. In unstressed syllables the opposition of midhigh and midlow vowels is neutralized, the quality of the other vowels remains distinct. There are two semiconsonants: /j/ and /w/, and 21 consonants: /p/, /b/, /t/, /d/, /k/, /g/, /ts/, /dz/, /tʃ/, /dʒ/, /f/, /v/, /s/, /z/, /ʃ/, /m/, /n/, /ɲ/, /l/, /ʎ/, /r/. Typologically uncommon is the systematic opposition of long to short consonants, which applies to all the items listed apart from six: /z/ is always short, and /ts/, /dz/, /ʃ/, /ɲ/, and /ʎ/ are always long intervocalically.

Illustration

Here follows a sentence (1) quoted for illustration:

(1) *A Venezia è più facile che si senta parlare il dialetto che l'italiano.*
'In Venice it is easier to hear people speaking dialect than Italian.'

Phonemic transcription: /a vve'nɛttsja ɛ ppju f'fatʃile ke ssi 'sɛnta par'lare il dja'lɛtto ke ll ita'ljano/. Note that this sentence is pronounced in Venice without 'syntactic doubling' (i.e., the lengthening of initial consonants in specified conditions) and with some of the variations mentioned above in the section,

'Writing System': /a ve'nɛtsja ɛ pju 'fatʃile ke si 'senta par'lare il dja'letto ke l ita'ljano/. In the local dialect this would be: /a ve'nɛsja ze pju 'fasie ke se 'seŋta par'lar el dja'eto ke l ita'ljaŋ/.

Note the gender and number agreement between articles and nouns; the use of the subjunctive governed by *facile che*; the interesting construction with *si*, which can be interpreted as an impersonal (with *si* acting as the indefinite subject of *senta*: 'one hears'), or as a passive, with the infinitive clause (*parlare*) acting as sentential subject ('speaking is heard'). Also, the subject of the infinitive need not be specified: '*si sente parlare*' 'one hears [someone] speak.' There is no dummy subject for *è* ('it is'), and the sentential subject clause introduced by *che* comes after the verb. The first *che* acts as a complementizer, and the second *che* as a conjunction within the comparative structure (*più* ... *che*).

Sociolinguistic Points

As mentioned above, in Italy there are many linguistic enclaves in which 'foreign' languages are spoken, and in some cases their use is 'protected' by special legislation. For the majority of Italians the traditional situation was one of diglossia (with the local dialect used in speech, and literary Italian in writing. After political unification, and particularly as a consequence of far-reaching social changes, such as internal migration (mostly from the south to northern industrial conurbations) and the influence of the mass media, Italian has been widely adopted in speech as well. Regional differentiation is clearly marked in phonology, identifiable in lexis, and less clearly noticeable in grammar. A colloquial variety of the language has developed that has been called 'popular Italian'; this appears to be gaining acceptability, and some of its features are penetrating into the standard written language (e.g., *gli* is now frequently found in writing for 'to them,' and sometimes even for 'to her,' as well as for the traditional 'to him'). The dialects have been diagnosed often as terminally ill and on the point of demise. In fact, they have proved remarkably resilient in ordinary usage, and sometimes they appear to be taken up by people (including the young) as a way of reasserting their own group identity and reacting against an alienating process of national equalization. There has also been a striking vitality in dialect poetry, often using very local, individual forms of the dialect, rather than a generalized, regional variety.

Descendants

Italian played an important part in the formation of the lingua franca used in the past in the Mediterranean. Since the Renaissance there have also been varieties of '*lingua zerga*' employed by vagrants. A level of 'slang' is generally thought not to be popular in Italian because its functions were filled by the dialects. A curious form of English slang, called 'parlyaree' or 'polari,' traditional among sailors, actors, and gays (and now surviving in the form of lexical relics) was based on Italian. Italian-based creoles seem to exist or to have existed in Eritrea, Argentina, and Brazil (Harris and Vincent, 1987: 20).

Languages Influenced

The influence of Italian has been mainly felt, in all the major European languages, at the level of high culture, in the lexis of music and the figurative arts. In the Renaissance, and for a long time subsequently, an acquaintance with Italian was thought to be part of the cultural equipment of educated people in most European countries.

History of Linguistic Investigation

More than for other European languages, linguistic awareness and a discussion of linguistic matters (the *Questione della lingua*) has always been very relevant for Italian intellectuals. During the Renaissance the description and codification of the language was an important part of national culture, and the *Vocabolario* (1612) of the Accademia della Crusca was the first of the great national dictionaries to be published. Less important was Italy's contribution to linguistic studies (including the historical investigation of the Italian language and dialects) during the nineteenth and twentieth centuries.

Italian as a Fusional Language

C Iacobini, Università di Salerno, Salerno, Italy

In a fusional language words are inflected (and derived) by using affixes whose boundaries are difficult to identify due to the tendency of affixes to fuse with one another and with the root. The numerous occurrences of allomorphy and the tendency of morphs to simultaneously encode several meanings result in the fact that there is no one-to-one correspondence between morphs and morphemes, thus making linear segmentation difficult.

Other terms are sometimes used instead of *fusional*: *flectional, inflectional*, or *inflecting, inflective*. The term *fusional* should be preferred to others referring to inflection because both agglutinating and polysynthetic languages can be highly inflectional.

Morphological Typology

The fusional type is one of the main morphological types. The classification of languages by morphological types is part of the standard terminology of linguistics, but it is also strongly criticized by the majority of typologists for three main reasons: (1) because the classification criteria are rather vague and difficult to apply in a consistent way; (2) because the morphological type is defined in terms of mutual favorability of properties rather than of implicational correlations, resulting in a low predictive power; and (3) because morphological typology has a holistic background.

The vagueness of the classification in morphological types is shown by the lack of consensus on both the number of types and the number of parameters identifying them (the three most-used parameters are (1) the ratio of morphs to word forms, (2) the number of morphemes to morphs, and (3) the degree of word-internal modification of morphs (Greenberg, 1954).

Modern linguistics has disavowed the ideological prejudice dating back to the 19th century, according to which the fusional morphological type was regarded as being superior to other types. Just like these, the fusional type is a combination of functionally interconnected features, which – as a whole – form an ideal construct characterizing (the whole, or some aspects of) the morphology of languages. Languages are rarely pure types; they usually mix elements of different types. Assigning a language to a specific type depends on the preponderance of features considered significant (the quantification of such features is a difficult problem to solve from a practical point of view).

Despite criticism, the classification by morphological types is convenient and widely used to rapidly identify a number of features that tend to cooccur in the morphology of a language, and also to assess the extent to which a language moves away from such ideal constructs, both in a synchronic and in a diachronic perspective (some authors argue that languages tend to move toward a typological goal (Dressler, 1985).

The Fusional Type

The best-known attempt to establish a list of features that cooccur in morphological types is the one made by Skalička (1966). The features that tend to cluster in languages displaying fusional morphology can be listed as follows:

1. Words are formed by a root and (one or more) inflectional affixes, which are employed as a primary means of indicating the grammatical function of the words in the language. Agreement is widely employed.
2. High degree of modification of internal morpheme boundaries, with a consequently difficult linear segmentation.
3. Tendency to cumulate morphological meanings in a single affix (with consequent asymmetry between the semantic and formal organization of grammatical markers).
4. Word-class distinction is maximal. Inflection is rich, regarding both the number of inflectional classes and the extension of paradigms.
5. Stem suppletion; many cases of both homonymy and synonimy among affixes; clear distinction between inflectional and derivational affixes.
6. A slight correlation with syntax can be seen in the relatively free word order (but there are also fusional languages with a fairly fixed word order).

The fusional type is differentiated from the isolating type by the use of bound morphs and the clear-cut distinction between word classes; it is differentiated

Italian as a Fusional Language

C Iacobini, Università di Salerno, Salerno, Italy

In a fusional language words are inflected (and derived) by using affixes whose boundaries are difficult to identify due to the tendency of affixes to fuse with one another and with the root. The numerous occurrences of allomorphy and the tendency of morphs to simultaneously encode several meanings result in the fact that there is no one-to-one correspondence between morphs and morphemes, thus making linear segmentation difficult.

Other terms are sometimes used instead of *fusional*: *flectional, inflectional*, or *inflecting, inflective*. The term *fusional* should be preferred to others referring to inflection because both agglutinating and polysynthetic languages can be highly inflectional.

Morphological Typology

The fusional type is one of the main morphological types. The classification of languages by morphological types is part of the standard terminology of linguistics, but it is also strongly criticized by the majority of typologists for three main reasons: (1) because the classification criteria are rather vague and difficult to apply in a consistent way; (2) because the morphological type is defined in terms of mutual favorability of properties rather than of implicational correlations, resulting in a low predictive power; and (3) because morphological typology has a holistic background.

The vagueness of the classification in morphological types is shown by the lack of consensus on both the number of types and the number of parameters identifying them (the three most-used parameters are (1) the ratio of morphs to word forms, (2) the number of morphemes to morphs, and (3) the degree of word-internal modification of morphs (Greenberg, 1954).

Modern linguistics has disavowed the ideological prejudice dating back to the 19th century, according to which the fusional morphological type was regarded as being superior to other types. Just like these, the fusional type is a combination of functionally interconnected features, which – as a whole – form an ideal construct characterizing (the whole, or some aspects of) the morphology of languages. Languages are rarely pure types; they usually mix elements of different types. Assigning a language to a specific type depends on the preponderance of features considered significant (the quantification of such features is a difficult problem to solve from a practical point of view).

Despite criticism, the classification by morphological types is convenient and widely used to rapidly identify a number of features that tend to cooccur in the morphology of a language, and also to assess the extent to which a language moves away from such ideal constructs, both in a synchronic and in a diachronic perspective (some authors argue that languages tend to move toward a typological goal (Dressler, 1985).

The Fusional Type

The best-known attempt to establish a list of features that cooccur in morphological types is the one made by Skalička (1966). The features that tend to cluster in languages displaying fusional morphology can be listed as follows:

1. Words are formed by a root and (one or more) inflectional affixes, which are employed as a primary means of indicating the grammatical function of the words in the language. Agreement is widely employed.
2. High degree of modification of internal morpheme boundaries, with a consequently difficult linear segmentation.
3. Tendency to cumulate morphological meanings in a single affix (with consequent asymmetry between the semantic and formal organization of grammatical markers).
4. Word-class distinction is maximal. Inflection is rich, regarding both the number of inflectional classes and the extension of paradigms.
5. Stem suppletion; many cases of both homonymy and synonimy among affixes; clear distinction between inflectional and derivational affixes.
6. A slight correlation with syntax can be seen in the relatively free word order (but there are also fusional languages with a fairly fixed word order).

The fusional type is differentiated from the isolating type by the use of bound morphs and the clear-cut distinction between word classes; it is differentiated

from the agglutinating type by the kind of juncture between morphemes and the nonbiunivocal correspondence between morphs and morphemes. In the synthetic vs. analytic distinction, the fusional type tends toward the synthetic end.

The fusional type is largely represented in Indo–European languages, especially the most conservative ones. Latin, Slavonic, and Romance languages are the ones that are most often mentioned as good representatives of this morphological type. The main features identifying the fusional type will be described hereafter using examples drawn from Italian.

Affixal Inflection and Agreement

Italian makes wide use of inflectional affixes (nouns, verbs, adjectives, pronouns, articles are usually inflected, whereas adverbs are invariable). Inflection is obtained by replacing the word ending.

The two following sentences show an example of agreement in the singular and in the plural:

quell-a buon-a ***tort-a*** *è finit-a, l-a avrei mangiat-a volentieri*
'that good pie is finished, I would have eaten it with pleasure'
quell-e buon-e ***tort-e*** *sono finit-e, l-e avrei mangiat-e volentieri.*

All the underlined elements agree in number and gender with the feminine noun in bold, the auxiliary agrees only in number, the adverb is invariable; it should be noted that agreement also affects the pronoun and the participle in the second clause.

Cumulative Exponence in Adjectival Inflection

The main adjectival inflectional class has four endings

bell-o 'nice' (sing MASC)
bell-i (PL MASC)
bell-a (sing FEM)
bell-e (PL FEM)

Each affix codes two grammatical meanings at the same time (i.e., gender and number). Regarding adjectival inflection, the Italian language is more fusional than other Romance languages. In Spanish, for example, the gender and the number are expressed by two separate morphs, and the morph for the plural is the same for the two genders:

hermos-o (sing MASC)
hermos-o-s (PL MASC)
hermos-a (sing FEM)
hermos-a-s (PL FEM)

The other important inflectional class employs two affixes: *-e* for the singular, *-i* for the plural. Homonymy is therefore observed between the affixes from the two classes (*-e* can signify both PL FEM and sing MASC or FEM; *-i* can signify both PL MASC or FEM). Compared with Latin, Italian has lost the ability to form the comparative through affixation (the few affixal comparatives in use are instances of fused exponence: in *migliore* 'better' and *minore* 'minor' it is not possible to segment the lexical base from the comparative suffix), whereas the superlative form is productively obtained by using the suffix *-issimo* (*bello/bellissimo* 'very beautiful').

Noun Inflection and Affixal Homonymy

A recent classification of Italian nominal inflection proposed by D'Achille and Thornton (2003) – superseding the very unsatisfactory traditional classification based on the endings of the singular form of nouns – distinguishes five inflectional classes (defined as a set of lexemes whose members each select the same couple of endings for singular and plural), plus a sixth class consisting of invariable nouns (the bottom line of Table 1 shows the percentage of types of each class in the Italian basic vocabulary).

Class 1 consists of masculine nouns in the overwhelming majority (*libro/-i*), with very few feminine exceptions (*mano/-i*). Class 2 is made up of feminine nouns only. Class 3 consists of masculine nouns by approximately 45% (*fiore/-i*), of feminine nouns by the same percentage (*siepe/-i*), and of ambigeneric by 10% (*cantante/-i* may be used both for a male or a female singer). Class 4 is mostly composed of masculine nouns (*poeta/-i*) but includes a couple of feminine nouns as well (*ala/-i*); in class 5 nouns are masculine in the singular and feminine in the plural (*uovo/-a*); all the nouns ending in a stressed vowel or in a consonant (class 6) are invariable, but class 6 also includes invariable nouns ending in each of the four vowels used as inflectional endings, except for /a/ in feminine nouns (MASC: *cinema, golpe, kiwi, stereo*; FEM: *consolle, ipotesi, radio*). Although there seems to be a tendency to express the singular by

Table 1 Nominal inflectional classes and percentage of types of each class in the Italian basic vocabulary

Nominal Inflectional Class	*1 sing/PL*	*2 sing/PL*	*3 sing/PL*	*4 sing/PL*	*5 sing/PL*	*6 sing/PL*
Endings	-o/-i	-a/-e	-e/-i	-a/-i	-o/-a	invariable
%	41.2%	30.3%	20.6%	1.2%	0.2%	5.4%

means of back vowels (*o* MASC, *a* FEM) and the plural by means of front vowels (*i* MASC, *e* FEM), the cases of affixal homonymy are quite numerous (remember that class 3 uses front vowels both for the singular and for the plural, and it includes masculine and feminine as well as ambigeneric nouns). Although on the one hand, the recent trend toward an increase of invariable nouns ending by a vowel curbs the ratio of inflected nouns, on the other it decreases the degree of correlation between form and inflectional class. The low predictability of both the inflectional class and gender is clearly shown in Table 2, which refers to singular (Thornton, 2001).

Traces of Case in Pronouns

Italian has lost a fusional feature that characterizes Latin nominal inflection: the case. However, one can detect traces of case in the Italian pronominal system. The choice of the correct form of certain pronouns (Table 3) demands a decision that depends on whether pronouns express a subject, a direct, or an indirect complement.

The system of stressed pronouns distinguishes three persons for the singular and three for the plural. The third-person singular has distinct forms on the basis not only of gender, but also of the feature ± human. The third-person plural subject differentiates gender but not the ± human feature. In the spoken language, the pronouns *lui, lei*, and *loro* tend to broaden their functional scope and are frequently used both as subject and nonsubject, even for nonhuman referents.

The Table 4 shows clitic pronouns with the function of direct and indirect complement.

The use of such pronouns is complicated by rules of reciprocal ordering as well as by allomorphy: all clitic pronouns that end in *–i* replace the vowel with /e/ if followed by another clitic.

ti racconto una storia '[I'll] tell you a story'
te la racconto'[I'll] tell it to you'
te lo porto '[I'll] bring it to you'
portaglielo 'bring it to him/her'

The pronoun *le* (singFEM) becomes *gli* when followed by another clitic, which results in homonymy and consequent breakdown of gender distinctions:

mostrale la stanza 'show her the room'
mostragli la stanza 'show him the room'
mostragliela 'show it to her/him'

Homonymy occurs also with other unstressed forms (*ci* and *vi* are also locative adverbs; *lo, la, gli*, and *le* articles) and with stressed pronouns in postverbal position (*te lo prendi con te* 'you take it/him with you').

Verb Inflection

The verb is the word class with the richest inflection both in number of forms and variability (many high-frequency verbs have irregular inflection). Tense, mood, person, and number are expressed affixally.

The most relevant features of the fusional type appear even within regular inflection. Grammatical meanings can be expressed as fused in a single morph (in the form *amo*, 'I love,' there is no other overt expression than the ending-*o* to code indicative mood, present tense, first-person, singular), as well as realized through a combination of several affixes, with complex exponence relations holding between morphs: in *canterébbero* '[if] they would sing' three morphemes (conditional, third person and plural) are signaled by the entire termination-*rébbero* as a whole. A linear segmentation is not possible because -*bb*- occurs only with forms that are both third person and conditional. The final -*ro* expresses plural and again third person, the stressed -*e*- occurs consistently only in conditional forms, and the -*r*- occurs with futures and (again) conditionals (Matthews, 1970).

A suprasegmental modification (stress on the last syllable) suffices to distinguish between two regular verb forms like *tème* (INDIC PRES 3sing) and *temé* (INDIC preterit 3sing).

Table 2 Low predictability of gender distinction on the basis of the singular ending of nouns

-o	prevailing MASC, but also FEM (*mano, foto*)
-a	prevailing FEM, but also MASC (*papa, clima*)
-e	equally divided between MASC (*fiore, cantante*) and FEM (*siepe, cantante*)
other	equally divided between MASC and FEM

Table 3 Stressed personal pronouns

Stressed Pronouns	*1 sing*	*2 sing*	*3 sing*	*1 PL*	*2 PL*	*3 PL*
Subject	io	tu	+hum: egli (MASC) ella (FEM) −hum: esso (MASC) essa (FEM)	noi	voi	essi (MASC) esse (FEM)
Nonsubject	me	te	+hum: lui (MASC) lei (FEM) −hum: esso (MASC) essa (FEM)	noi	voi	loro

Table 4 Clitic personal pronouns

Clitic Pronouns	*1 sing*	*2 sing*	*3 sing*	*1 PL*	*2 PL*	*3 PL*
ACC	mi	ti	lo (MASC) la (FEM)	ci	vi	li (MASC)le (FEM)
DAT	mi	ti	gli (MASC) le (FEM)	ci	vi	-

Table 5 Indicative present regular inflection of the three traditional verbal classes

INDIC PR	*Class-a-sing*	*PL*	*Class-e-sing*	*PL*	*Class-i-sing*	*PL*
1	cànt-o	cànt-iàmo	tèm-o	tem-iàmo	àpr-o	apr-iàmo
2	cànt-i	cànt -à-te	tèm -i	tem-é-te	àpr-i	apr-ì-te
3	cànt-a	cànt -ano	tèm -e	tèm -ono	àpr-e	àpr-ono

Table 5 shows instances of regular inflection of indicative present for the three traditional classes on the basis of the thematic vowel (accent marks have been added, even though not in use in normal orthography). Noteworthy, are the cumulative expression of more meanings by means of a single ending, and the omission of the thematic vowel with the exception of the second plural.

Table 6 Indicative imperfect inflection of regular class -a- verbs

INDIC Imperfect class -a-	*sing*		*PL*
	1	cant-à-v-o	cant-a-v-àmo
	2	cant-à-v-i	cant-a-v-àte
	3	cant-à-v-a	cant-à-v-ano

The thematic vowel may also undergo some allomorphies: in class *-a-* it is replaced by /e/ in the indicative future (*amerò*) and the present conditional (*amerei*), in class *-i-* by /e/ in the present participle (*aprente*) and in the gerund (*aprendo*), in class -e- by /u/ in the past participle (*voluto*), and by /i/ in the derivation of deverbal nouns and adjectives (*temibile*, *spremitura*).

The indicative imperfect is the tense that least identifies with the fusional type, for it shows the best correspondence between morphs and morphemes in Italian conjugation (Table 6). But also in the imperfect the categories of person and number, as well as those of mood and tense, merge in a single morph. The person–number affixes largely overlap (even though not entirely) with those of the present, whereas the morph *-v-* has no other use in the conjugation.

Besides synthetic forms, there are also analytic forms resulting from the combination of an auxiliary and a past participle. The main auxiliary verbs are *essere* 'to be' and *avere* 'to have'; both are highly irregular

INDIC PRES *sono, sei, è, siamo, siete, sono*
INDIC preterit *fui, fosti, fu, fummo, foste, furono*
INDIC IMPERF 1PERS *ero*, INDIC FUT 1PERS *sarò*; PP *stato*

The auxiliary expresses tense, mood, person, and number, whereas the past participle can either agree in gender and number or be employed in the citation form (singMASC), whereas the agreement between participle and subject is systematic with verbs whose auxiliary is *essere* (*i ragazzi sono partiti* 'the boys have left'/*la ragazza è partita* 'the girl has left'), in verbs whose auxiliary is *avere* the agreement is with the object, and it occurs only within limited contexts (*hai comprato le pere? sì le ho comprate* 'have you bought the pears? Yes, I have bought them').

The indicative future and the present conditional are interesting from a typological point of view. They have stemmed from an analytic origin to reach a fusional state.

Many verbs have an irregular conjugation. The majority belong to the *-e-* class, some others to the *-i-* class, only three to the *-a-* class. The traditional classification does not allow to catch the similarities between *-e-* and *-i-* classes. Dressler *et al.* (2003) classify Italian verbs in two macroclasses based on the productivity criterion, as well as on formal correlations that allow us to also take into account the subdivisions within each class.

It would be neither possible nor helpful to mention here all the instances in which the verbs depart from the regular conjugation model. Idiosyncrasies occur primarily in the present (indicative and subjunctive), the preterit, and the past participle.

Pirrelli and Battista (2000) show that in the irregular conjugations the modifications of the stems range along a continuum from minor phonological processes to clear suppletion instances.

Table 7 Examples of stem modifications in the indicative present inflection of some very frequent irregular verbs

	nascere	*'be born'*	*udire*	*'hear'*	*sedere*	*'sit'*	*finire*	*'finish'*	*dovere*	*'must'*	*andare*	*'go'*
	sing	*PL*	*sing*	*PL*	*sing*	*PL*	*sing*	*PL*	*sing*	*PL*	*sing*	*PL*
1	'nasko	na'ʃːamo	'ɔdo	u'djamo	'sjɛdo	se'djamo	fi'nisko	fi'njamo	'devo	do'bːjamo	'vado	an'djamo
2	'naʃːi	na'ʃːete	'ɔdi	u'dite	'sjɛdi	se'dete	fi'niʃːi	fi'nite	'devi	do'vete	'vai	an'date
3	'naʃːe	'naskono	'ɔde	'ɔdono	'sjɛde	'sjɛdono	fi'niʃːe	fi'niskono	'deve	'devono	'va	'vanno

Table 8 Examples of stem modifications in the indicative preterit inflection of some very frequent irregular verbs

	venire 'come'		*perdere 'lose'*		*fondere 'melt'*	
	sing	*PL*	*sing*	*PL*	*sing*	*PL*
1	vénni	venìmmo	pèrsi	perdémmo	fùsi	fondémmo
2	venisti	veniste	perdésti	pérdéste	fondésti	fondéste
3	vénne	vénnero	pèrse	pèrsero	fùse	fùsero

Table 7 displays the phonetic transcription of indicative present conjugation of six irregular verbs that exhibit a number of stem alternations: palatalization before a front vowel (*nascere*), ablauting of root vowel (*udire*), diphthongization (*sedere*), *-isc-* insertion and palatalization (*finire*), ablauting, consonant labialization and lengthening (*dovere*), and stem suppletion (*andare*).

Two things are noteworthy here. The first is that phonological phenomena responsible for the stem modifications are synchronically inoperative. The second is that these different phenomena are distributed according to a recurrent pattern – which is visible also in the stress position within the regular conjugation: on the one hand 1,2,3sing 3PL on the other 1,2PL (Vincent, 1988).

The most common irregular modifications of preterit stems concern lengthening of final consonant (*venire*), replacing of final consonant with /s/ (*perdere*), and other more complex phenomena that include ablauting of root vowel and deletion/insertion of consonants (*fondere*). Even in the preterit a morphological pattern of stem alternation is detectable, which distinguishes 1,3sing 3PL vs. 2sing 1,2PL (see Table 8).

Even though the majority of alterations were originally phonologically motivated, their present distribution is morphological in nature and paradigmatically governed.

Affixes

Obligatoriness, higher systematicity in mutual relationships, and degree of productivity clearly distinguish inflectional from derivational affixes in fusional languages. Yet the number of productive Italian derivational affixes and the variety of meanings they express are fairly high (Grossmann and Rainer, 2004). Whereas derivation employs both suffixes and prefixes, inflection employs suffixes only. In productive processes the degree of phonological fusion between the stem and derivational affixes is rather low. A higher degree of phonological integration is present instead with interfixes. Some interfixes are semantically void (*congress-<u>u</u>-ale* 'concerning congresses'), the majority express connotative value when combined with evaluative suffixes (*test-<u>ol</u>-ina* 'nice small head'). Words containing interfixes are rather difficult to be segmented. This is because interfixes occupy an intermediate position between the root and the suffix, and generally their morphemic and syllabic boundary does not coincide.

The clear-cut difference between affixes and roots characterizes Italian as a fusional language and distinguishes it from agglutinating languages, which grant affixes greater autonomy (Plungian, 2001). In Italian the coordination between bound elements referring to a same root is marginal (*micro- e macroeconomia* 'micro- and macroeconomy'); moreover, there is no use of a single affix referring to a coordinated group (cf. Spanish *afirmativa o negativa<u>mente</u>* 'affirmatively or negatively'). Another fusional trait of Italian derivation is the signaling through the change of inflectional class of derivatives formed by means of conversion, which belong to the same word class as the base (*banana* FEM, PL *-e* 'banana'-> *banano* MASC, PL *-i* 'banana tree').

Word Order Mobility

The Italian basic word order (SVO) is more flexible than what we encounter in less-fusional languages.

Agreement (in gender and number) provides cohesion among words within phrases, and a certain degree of mobility freedom for the phrases themselves. Instead, single words are less free to move compared to words in more inflecting languages, such as Latin, for instance, (Simone, 1993). Whereas in Latin, the use of cases allows to signal on each word its relational syntactic functions, thus rendering it relatively autonomous within the phrase, in Italian the analytic expression (through prepositions) of syntactic relations demands the proximity and the reciprocal ordering of words within the phrases. Thus, order variation occurs primarily at the level of the reciprocal ordering of phrases (many instances of topicalization, cleft sentences, postverbal subject position). Adjectives stand out from other word classes for a higher degree of movement freedom within the phrases. Even though the unmarked position of the qualifying adjective is postnominal (according to the basic order SVO), this may vary, which at times effects a change in meaning (cf. *famiglie numerose* 'large families' and *numerose famiglie* 'several families').

Italian Lexicography

A Alonge, University of Perugia, Perugia, Italy

The birth of Italian monolingual lexicography can be traced back to the end of the 15th century, when the first lists of vernacular words were compiled. The first printed monolingual inventory, *Le tre fontane* by Niccolò Liburnio, was published in Venice some time later, in 1526. Partly following Bembo's proposals with respect to the *querelle de la langue* (according to which Petrarch's language should have been the model for poetry and Boccaccio's language for prose), Liburnio lists and defines terms taken from the works of Dante, Petrarch, and Boccaccio. Other dictionaries published in those years had the same purpose, to encode and define the lexicon of the 14th-century Tuscan classics, to be imitated by those aspiring to linguistic elegance: e.g., Lucilio Minerbi's *Vocabulario* (Venice, 1535); Francesco Alunno's *Le Osservazioni sopra il Petrarca* (Venice, 1539; 1550), and *Le ricchezze della lingua volgare sopra il Boccaccio* (1543).

The *Vocabulario di cinquemila Vocabuli Toschi* by Fabricio Luna (Naples, 1536) has been described as the first true Italian dictionary, ordered alphabetically and listing 5000 terms taken from the works of various authors of different cultural and geographical origins, but also from contemporary usage. Alberto Acarisio's *Vocabolario, grammatica, et ortographia de la lingua volgare* (Cento, 1543) is interesting both for the richness of data encoded for each lemma (compared to other works of the time, Acarisio's work pays more attention to scientific terminology

Italian Lexicography

A Alonge, University of Perugia, Perugia, Italy

The birth of Italian monolingual lexicography can be traced back to the end of the 15th century, when the first lists of vernacular words were compiled. The first printed monolingual inventory, *Le tre fontane* by Niccolò Liburnio, was published in Venice some time later, in 1526. Partly following Bembo's proposals with respect to the *querelle de la langue* (according to which Petrarch's language should have been the model for poetry and Boccaccio's language for prose), Liburnio lists and defines terms taken from the works of Dante, Petrarch, and Boccaccio. Other dictionaries published in those years had the same purpose, to encode and define the lexicon of the 14th-century Tuscan classics, to be imitated by those aspiring to linguistic elegance: e.g., Lucilio Minerbi's *Vocabulario* (Venice, 1535); Francesco Alunno's *Le Osservazioni sopra il Petrarca* (Venice, 1539; 1550), and *Le ricchezze della lingua volgare sopra il Boccaccio* (1543).

The *Vocabulario di cinquemila Vocabuli Toschi* by Fabricio Luna (Naples, 1536) has been described as the first true Italian dictionary, ordered alphabetically and listing 5000 terms taken from the works of various authors of different cultural and geographical origins, but also from contemporary usage. Alberto Acarisio's *Vocabolario, grammatica, et ortographia de la lingua volgare* (Cento, 1543) is interesting both for the richness of data encoded for each lemma (compared to other works of the time, Acarisio's work pays more attention to scientific terminology

and to phraseology) and for an attempt to encode many lemmas that are not found in the works of the 14th-century classics. Other prominent lexicographical works of the time are Alunno's *Fabrica del mondo* (Venice, 1548), which is divided into 10 sections and may be considered the first methodical Italian dictionary, and Giacomo Pergamini's *Memoriale della lingua*, first published in Venice in 1602 and then reprinted various times.

The first *Vocabolario degli accademici della Crusca* was published in Venice in 1612 and became a model for monolingual European lexicography. It conformed to new and scientific criteria: orthographical and grammatical norms were stated, more coherent modes of defining entries were used, and various standardizing expedients were adopted. Again, the main aim of the work was to indicate the best linguistic norm, by referring to the three main 14th-century writers, but also to other texts written in Florence in the same period, following proposals put forward by Leonardo Salviati. The *Vocabolario* was enlarged and republished many times until 1923 and, although criticized because of the limits it imposed on contemporary language use, it contributed substantially to the definition and diffusion of a national language. A new project, initiated in 1965, aims at historical documentation and is now realized by the *Opera del Vocabolario Italiano*, an institute of the C.N.R. (*Consiglio Nazionale delle Ricerche*).

Various dictionaries were compiled in the 17th and 18th centuries aimed at contesting the primacy of the Tuscan language, while other works followed fundamental principles which had inspired the *Crusca* dictionary, indicating possible additions and innovations to it.

In the 19th century, while the *querelle de la langue* was still engaging personages like Alessandro Manzoni and Graziadio Isaia Ascoli, new dictionaries were produced that included new technical terms, referred to new sources and took into account current colloquial usage. However, the most important work of the time is the *Dizionario della lingua italiana* (Torino, 1861–1879) by Niccolò Tommaseo and Bernardo Bellini: notwithstanding some limitations of the work (e.g., etymologies are often ill-founded), the richness of examples still makes it a useful lexicographical tool.

Among the many dictionaries of Italian published from the beginning of the 20th century up to now, we find both large scholarly dictionaries and more practical ones. The *Grande Dizionario della lingua italiana* (1961–2002), founded by Salvatore Battaglia, is an unsurpassed historical dictionary (UTET, Turin) comprising 21 volumes. The *Lessico Universale Italiano* (Istituto dell'Enciclopedia Italiana, Rome, 1968–1981), in 24 volumes, has qualities of both an encyclopedia and a dictionary. Another great dictionary is the *Grande dizionario d'uso della lingua italiana* directed by Tullio De Mauro and containing 263 000 lemmas: first published in 1999 (UTET), it was updated in 2003, when the seventh volume was published. Among the many practical dictionaries, just two examples may be mentioned: Nicola Zingarelli's *Vocabolario della lingua Italiana*, first published in 1917, then reprinted and updated many times up to the present day, most recently by Miro Dogliotti and Luigi Rosiello (Zanichelli, Milan, 2004); and the *Dizionario della lingua italiana* by Giacomo Devoto and Gian Carlo Oli, first printed in 1967 and also republished many times: the 2004–2005 edition is by Luca Serianni and Maurizio Trifone (Le Monnier, Florence). While electronic versions of these and other contemporary dictionaries are also published, pioneering work has been carried out (notably at the ILC-CNR [*Istituto di Linguistica Computazionale-Consiglio Nazionale delle Ricerche*], Pisa) to produce online lexical resources, first of all the *Dizionario-macchina dell'italiano*. Another lexical online resource recently developed (*ILC*, 1996–2001) is *ItalWordNet*, a thesaurus-like resource, basically structured in the same way as *WordNet,* a system whose design is inspired by current psycholinguistic theories of human lexical memory, developed at the Cognitive Science Laboratory at Princeton University in the United States.

Beside monolingual dictionaries, other lexicographical works are worthy of mention: etymological dictionaries (e.g., the one by M. Cortelazzo and P. Zolli, recently republished in 1999 by Zanichelli); frequency lexicons (LIF [*Lessico italiano di frequenza]*, by U. Bortolini, C. Tagliavini, and A. Zampolli, for Garzanti-IBM, Milan, 1972; LIP [*Lessico di frequenza dell'italiano parlato],* T. De Mauro, F. Mancini, M. Vedovelli, M. Voghera, for Etas, Milan, 1993); regional dictionaries (a notable example is the *Vocabolario Siciliano*, founded by G. Piccitto and subsequently directed by G. Tropea, 1977–2002).

Italy: Language Situation

A L Lepschy
G Lepschy

This article is reproduced from the previous editions, volume 4, pp. 1792–1793, © 1994, Elsevier Ltd.

It is traditionally taken for granted that Italy is basically a monolingual state, and that Italian is the national/official language, used not only in literature but also in government, administration, newspapers, and of course as the medium of instruction in schools and universities.

The reality is different. It is useful to consider two distinct sets of facts. One concerns the existence of so-called minority languages within the Italian territory. There are enclaves in which foreign languages are spoken; this may result from an earlier immigration of communities that preserved their language through the centuries – as is the case in villages in central and southern Italy, where the inhabitants speak Albanian (ca. 100 000), Greek (ca. 30 000), Catalan in Alghero (ca. 15 000), and Serbo–Croatian (ca. 3000); or it may result from the inclusion within the Italian boundaries of populations speaking foreign languages – as in the case of German in South Tyrol (ca. 280 000), Occitan and Franco-Provençal in Piedmont (ca. 115 000), and Slovene in the Veneto (ca. 53 000).

The second set of facts concerns the use of so-called Italian dialects. These are separate and, on the whole mutually unintelligible, Romance languages, classifiable into 15 or so regional groups (Ligurian, Piedmontese, Lombard, Venetian, Tuscan, etc.); they are cognates (rather than varieties) of literary Italian, which is itself based on Tuscan. Many linguists consider Sardinian, Ladin, and particularly Friulian, as separate languages. Here the situation is complicated by the difficulty of establishing how widespread the use of dialect is. It was calculated that at the time of unification only a small minority (suggested figures range between 2.5–10%) of the inhabitants of the new state knew Italian. It appears that in the 1980s, about half of all Italians still used a dialect at home and with friends (this applies particularly to southern Italy and the Veneto). The novelty is that even dialect speakers are mostly bilingual with Italian. Although traditionally the dialect was used in all circumstances (some speakers employing it even in the context of high culture), diglossia seems to prevail, Italian being the high variety (used in public life, in official contexts, and for elevated topics), and dialect the low variety (used in the home and for personal, everyday exchanges).

The status of minority languages was, until World War II, mostly unrecognized. Successively the regions of Trentino–Alto Adige and of the Valle d'Aosta have obtained full recognition for the use of German and French, respectively, in education and in public life. This also applies, to a lesser extent, to Sardinia and Friuli–Venezia Giulia. Political pressure is mounting to extend similar recognition to other 'foreign' minority languages, and even to some of the regional dialects, such as Lombard or Venetian.

Complex linguistic problems are posed by new waves of immigration, mainly from Africa, in the late 1980s and early 1990s. As for foreign languages studied in schools, French, which was dominant until World War II, has since lost its primacy to English.

Ivory Coast: Language Situation

F Ahoua, Université de Cocody, Abidjan, Côte d'Ivoire

Ivory Coast, officially named Côte d'Ivoire, is situated in West Africa, approximately between Latitude 8° 00′ N and Longitude 5° 00′W. The country has an area of 322 460 km^2 and a population density of 50 inhabitants/km^2. The country is bordered on the south by the Atlantic Ocean, on the west by Guinea and Liberia, on the north by Mali and Burkina Faso.

The population is currently estimated at 17 327 724. The official census of 1998 (*Récensement Général de la Population et de l'Habitat*) estimated the literacy rate at 45%. The percentage of males is about 57% while that of females is about 43% (2003 estimate). The percentage of foreign immigrants is believed to be close to 26%, which has consequences for the migrant languages spoken in Ivory Coast (mainly Moore [Mòoré], Fulfulde, Soninke, Maninkan [Maninka], Bambara [Bamanankan], Krahn, Glio [Glio-Oubi]).

Number of Languages and Language Families in Côte d'Ivoire

The French colonial borders – that were established from 1893 to 1960 and definitely remained – did not take into consideration the actual ethnic and language boundaries and used political and geographic criteria. This has resulted in the splitting of the language groups that lie along the borders (see also Kropp-Dakubu 2000a,b,c).

For instance, the languages Anyi and Nzema are spoken both in Ghana and Ivory Coast, across the political borders of today. Speakers of the Senoufo and Manding language families stretch beyond the borders of Ivory Coast, into Mali, Sierra Leone, Guinea, and Burkina Faso. Dan and Guere are spoken in Ivory Coast and Liberia as well. The languages were spoken in these areas long before the colonial boundaries were established. This situation is different from most recent cases of immigration, involving the use of a language in the already established borders by the French and British.

The heterogeneity and the relatively large but so far often inaccurate number of languages of Ivory Coast raise the question of the criteria of language identification (as opposed to dialects), mutual intelligibility, genetic classification, relationship between social status and levels of usage, and political or cultural importance of the languages. The issue impels one to clarify which criteria are necessary or sufficient, and in many cases go beyond mere linguistic criteria. For example, earlier works on Ivorian languages (Delafosse, 1904) equated language with ethnicity, while even more recent sources often (Ethnologue, 1988) do not distinguish between local languages and recent foreign languages.

The following list presents the indigenous languages of Ivory Coast in alphabetical order based on most recent linguistic criteria:

- Abbey (Abé)
- Abidji
- Abron
- Abure
- Adiukru (Adioukrou)
- Aizi, Aproumu
- Aizi, Mobumrin
- Aizi, Tiagbamrin
- Alladian
- Anyin
- Attié
- Avikam
- Baule (Baoulé)
- Beng
- Bété, Daloa
- Bété, Guiberoua
- Beti (Eotile)
- Dan (Yacuba)
- Dida, Lakota (Dieko, Gabo, Satro, Guébie, Brabori, Ziki)
- Dida, Yocoboué
- Dioula (Jula)
- Ebrié (Cama)
- Ega (Diés, Egwa)
- Esuma (Essouma)
- Gagu (Gagou, Gban)
- Godié
- Guéré, Central (Wé, Southern)
- Guro (Kweni)
- Kodia (Kwadia, Kwadya)
- Kouya (Kowya, Sokya, Kuya)
- Krobu (Krobou)
- Krumen
- Kulango, Bondoukou
- Kulango, Bouna
- Mwan (Muan, Mona, Mouan, Muana, Mwa)
- Neyo (Gwibwen, Towi)
- Nyabwa (Nyaboa, Niaba,Nyédébwa)
- Nzema (Appolo, Nzima)
- Senoufo, Cebaara (Senari)
- Senoufo, Djimini
- Senoufo, Niarafolo-Niafolo (Senoufo, Nyarafolo)
- Senoufo, Palaka
- Senoufo, Shempire
- Senoufo, Tagwana

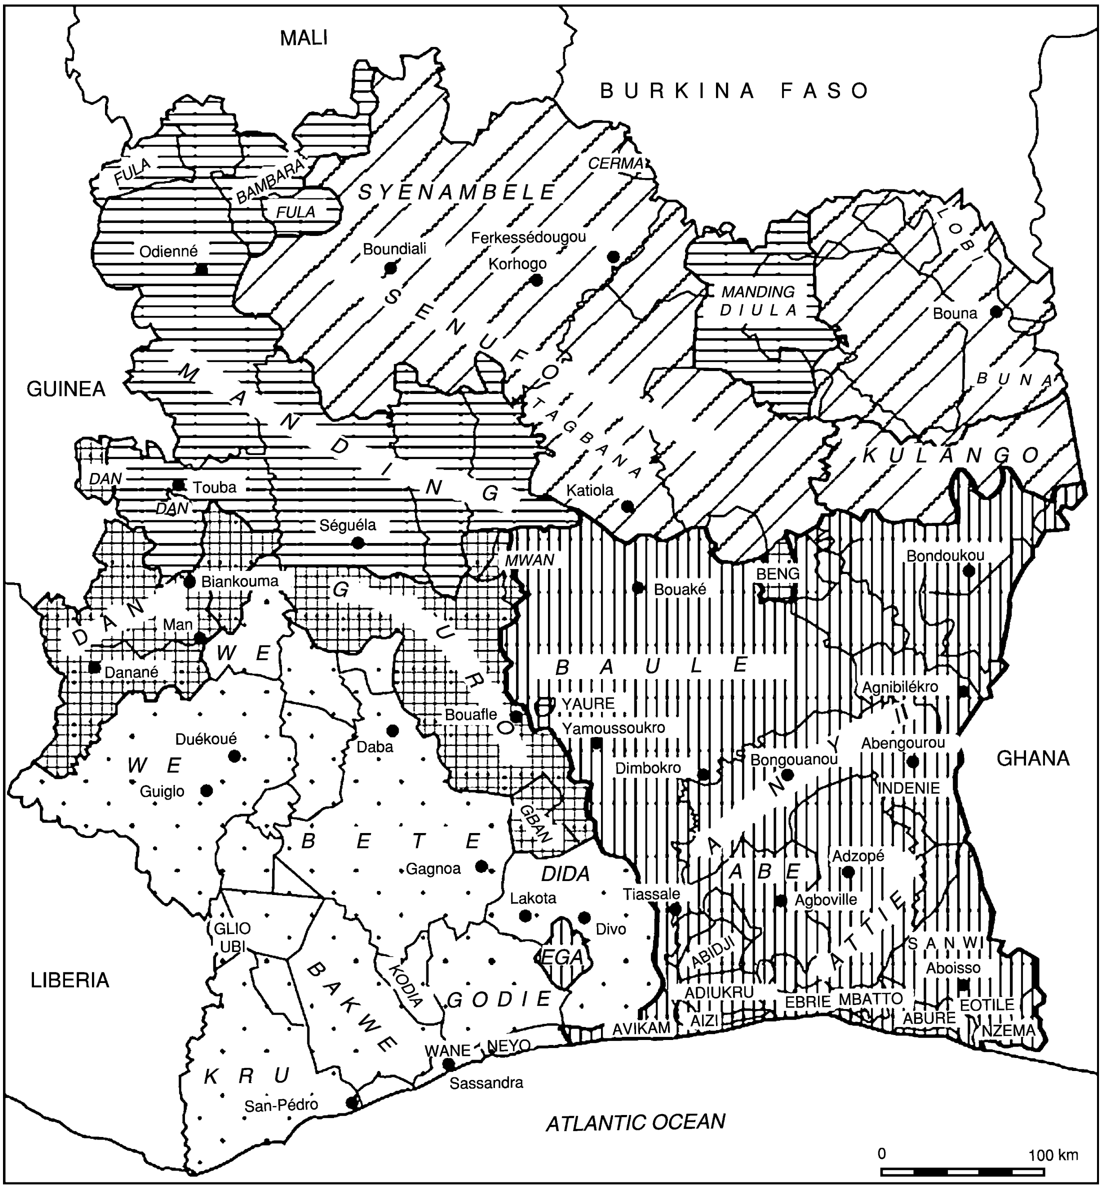
- Tééń
- Toura
- Wan
- Wané
- Wobe (Wɛ̃, Northern)
- Yaouré

Despite the large diversity of the ethnic groups, it is possible to group the Ivorian languages into four greater families by using linguistic criteria: Mande, Kru, Akan, Voltaic or Gur (cf. map below, Figure 1). The name 'Voltaic' has long been used in the francophone area but is being abandoned for the name 'Gur,' which means 'language' (Gurma, Gurunsi).

1. The Mande group is located in the northeast of Côte d'Ivoire, and covers the Manding (Delafosse's Malinke, Bambara, Dioula) and the southern Mande. In the western central part of the country live the Dan in a mountaneous area, surrounding the city of Man (cf. Braconnier *et al*., 1983; Tera, 1986).
2. The Kru group: The central-western and south-western areas are occupied by the Kru or Maguwe, of which the major ethnic group is the Bete.
3. The Gur group contains Senufo as a set of diverse languages including Lobi, Tagbana, Cebaara, and is geographically located in the north.
4. The Kwa group covers the east, center, and south-east of Ivory Coast. The most numerous sub-group is the Baule language with about 60 dialects. Sixteen languages compose the Kwa group in the Ivory Coast: Baule, Agni (Anyin), Abron, the lagoon languages (Ebrié, Abouré, Esuma, Adiukrou, Abidji, Avikam, Alladian, Eotile, Abbey, Mbatto or Ngula (Mbato or Gwo), Nzema, Abidi (Abidji)), and three isolates: Ega, Attie, Krobu.

An official census conducted in 1998 provides the following percentages of the individual ethnic groups: Akan 42.1%, Gur 17.6%, Northern Mande 16.5%, Kru 11%, Southern Mande 10%, others 2.8% (including only 130 000 Lebanese and 14 000 French). If that census is to take into account all the African and other ethnic groups, one has to revise the percentages by computing the approximate 26% that constitute one-third of the total population of Ivory Coast.

The non-Ivorian population includes people from Malba Birifor, Bissa (63 000), Dogoso, Maasina Fulfulde (1200), Glaro-Twabo, Eastern Karaboro (5000), Khe, Mòoré, Nafaanra, Sìcìté Sénoufo, Siamou, Southern Toussian, Turka, Vietnam, Burkina Faso (3 000 000), Mali (754 000), Guinea (238 000), Liberia (200 000) and others (345 000) (1993). Ghanaians approach almost 500 000, Europeans almost 20 000 (the number includes French, binationals, Germans, and Belgians). Syro-Lebanese are estimated at 100 000.



The geographic distribution of the ethnic groups is as follows in the north Senoufos (9.7%), Dioulas (3.4%), Malinkes (8.5%); in the center Guros (3.6%) and Baules (6.6%); in the west the Dans or Yacubas (5.9%), Betes (5.7%), Gueres (3.4%), Wobes (1.7%), Krumen-Didas-Bakwes-Godies (2.1%); in the south, the Ebriés (Cama) -Mbatos (Gwas) (0.7%), Adiukrus-Abidjis-Alladians-Avikams (1%), and Nzemas, Abbeys (1.4%).

The largest individual (first) language in Ivory Coast is Baule, because the Senufos use different languages. In practice, the language that is most used as a second language in markets and for commercial, cultural, and religious activities is Dioula. The list of the languages in Table 1 is not comprehensive, but includes the 17 most widely distributed languages. Though the list indicates 1.2% native Dioulas, the number of users may be about 14.5%. Investigations made on conversations in the markets estimate that 88% of the verbal exchanges in such environments are performed in Dioula.

Multilingualism and Diglossia

The national or official language, the *lingua franca* is French. French still remains the official language, widely used in schools, sometimes at different school levels, and is the obligatory language for administration and the major language of the media. Because of the contact situation, a local indigenous French has emerged, including new variants, one of which is called 'nouchi,' a slang or a secret language derived from French and the Ivorian languages, used as in daily communication and in popular songs.

Multilingualism is the most common factor among all the minority languages. The issue is not how perfect the second language is under control but how often it is used. Second languages are frequently used on a daily basis. For instance, all the Manding (formerly Malinke) use Dioula as a second language in religious, commercial, and cultural activities. This situation is valid for all the Senufos. The Ega use Dida in everyday life, but their own Ega language in the family, though the situation is more complex, because exogamy favors marriage with the Dida women, so that Ega children grow up with Dida. All the Eotile speak Anyi, Abure, and Nzemas at the respective ethnic borders where the Eotile villages are located in enclaves. All the Aizi perfectly speak Adiukru, a major, more commercially and culturally powerful

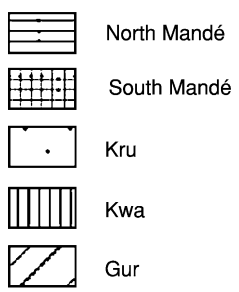

Figure 1 Language use in Ivory Coast.

Table 1 Language use in Ivory Coast

Language	*Number of Speakers*	*Percentage*	*Linguistic Affiliation*
1. Baule	2 130 000	14.8%	Kwa
2. Senufo	1 245 500	8.7%	Gur
3. Dan	800 000	5.5%	Mande
4. Anyi	610 000	4.2%	Kwa
5. Attie	381 000	2.6%	Kwa
6. Guere	317 688	2.2%	Kru
7. Bete	280 000	1.9%	Kru
8. Dioula	179 000	1.2%	Mande
9. Abbey	170 000	1.1%	Kwa
10. Mahou	169 100	1.1%	Mande
11. Wobe	156 300	1.0%	Kru
12. Lobi	155 800	1.0%	Gur
13. Kulango	142 000	0.9%	Kru
14. Brong (Abron)	131 700	0.9%	Kwa
15. Dida	101 600	0.7%	Kru
16. Adiukru	100 000	0.6%	Kwa
17. Soninke	100 000	0.6%	Mande

ethnic group. The Krobu in general speak Adiukru and Abbey very fluently, and sometimes Baule. The Mbatto generally speak Attie or Abure as second languages.

The Wan speak Guro and Baule-Kode and the Nguin speak Baule as a second language. The Mau generally use Dioula as a second language but only older Mau people speak Dan fluently, in specific cases of trade with the Dans. The Yaure speak Guro and Baule as second languages, respectively at the Guro and Baule borders; the Gagu use Baule and Bete as second languages, respectively at the Baule and Guro borders. The Brong and Kulango use each other languages as second languages, and the Tagbanas are generally bilingual with Baule.

In all cases of multilingualism in Ivory Coast, specific situations determine whether the speakers prefer one type of language or the other, suggesting a strong case for diglossia. The typical language that is used for religious and commercial cases is Dioula, at the market (about 70%), and secondly Ivorian French and Baule (30%) in proportion with dominance of Dioula in trade activities. French is definitely used for administration and the local native languages are used at home.

Ivorian French and Argots

It is estimated that 36% of the population up to six years old use a variant of French called 'Français Populaire Ivoirien' (cf. Djite, 1989a,b). More than 1 million of the illiterate population use a pidgin French called 'Français de Moussa' or 'Francais de Dago,' which is more or less similar to 'Français de petit nègre,' difficult to understand for non-Ivorian Francophones.

A number of researchers and most recent studies have established a Standard Ivorian French used in the official newspapers and in the public media (radio and television) and by students (cf. Boutin, 2002; Hattiger, 1981; Lafage, 1989).

Though Kouadio (2000) suggests that there are three types of variants, a high, middle, and lower class level, in practice, there may be also three registers: formal, informal, and popular or pidgin that are used by all classes, according to the situation and the speakers. The formal register is used in the public media, schools and universities, the second in informal situations, and the last by illiterate people.

Variants of French used by illiterates, called Moussa or Dago French (pidgin types according to Kokora 1980, 1983a,b) as mentioned above, are quite well known and have been often stigmatized in the newspapers or on the TV and radio.

Nouchi is a secret language that has been made popular, thanks to well known music groups (Zuglu) and local reggae musicians (Serges Kassy).

Language Policy and Use

There has been no clear policy for the development of local languages. Many projects have set French as the priority standard language. The reason is that, contrary to other West African Francophone countries, there is no national language such as Wolof in Senegal, Bambara in Mali, Moore in Burkina Faso, Gen-Mina in Togo, Fon (Fon-Gbe) in Benin, and Akan in Ghana. Though the Baule and Anyi block are the dominant languages, they are not the dominant trade languages as is Dioula, which is a favorite for a national language because of its widespread use all over the country (cf. Djite, 1988; Tera 1986).

Nevertheless, there were attempts to introduce local languages, such as Dan, Cebaara, and Attie, until the CE1 or CM2 (that is, from Grade I to Grade 5) in some very restricted projects. But although such projects proved to be successful for the teaching of sciences and Maths, they never acquired a national status due to their often detrimental effects on the acquisition of spoken French.

Most descriptive work on Ivorian languages, especially with respect to the Atlases (cf. Hérault 1983 on Kwa, Marchese 1983 on Kru, Mensah and Tchagbale 1983 on Gur, Halaoui *et al.* 1983 on South-Mande, Braconnier *et al.* 1983 on North-Mande) were carried out by the Institute of Applied Linguistics which was created by Law no. 66–375 of September 8, 1966. Further additions regarding teaching reforms were introduced in 1977 and extended by Law no. 96–696 of

September 7, 1995. The closest collaborator for the Atlases was the Summer Institute of Linguistics.

The Bible Society has also contributed to translation of the Bibles into the following languages: Abbey, Abidji, Adiukru, Alladian, Anyi, Attie, Avikam, Baule, Bete, Birifior, southern Bissa, Cebaara, Cerma, Dan, Dida, Ebrie, Fula, Macina (Fulfulde, Massina), Gban, Guro, Guere, Diula, Karaboro, Kulango, Krumen, Southern Lobiri, Nyabuwa, Nzema, Senufo, Djimini, Tagbana, Teen, Tura and Wobe.

As reported by Kouadio (2000), 20 hours out of 168 hours per week of radio broadcasting are given in 14 languages, that is: Abbey, Adiukru, Attie, Baule, Bete, Dida, Dioula, Ebrie, Guere, Krumen, Kulange (Kulango, Bondoukou), Senufo, Dan, and Moore. The National Television broadcasts 3 hours out of 81 per week in local languages.

A number of Ivorian languages are isolated among different other larger language groups, for example, Beng (Ngain, Nguin, Gan) with 17 000 speakers, Aizi Mobumri, Wan (Mona), and Gagu, Yaure. Some of these languages are endangered, and documentation on them would benefit the linguistic and the speaker community. Two examples of endangered languages in Ivory Coast are Mbre (Bre, Bere, Pré Pisia), a recently discovered language of unknown affiliation in central Ivory Coast spoken by about 200 speakers the Bondosso and Nitanbo villages, for which only sketchy descriptions exist, and the last remaining dialect of Eotile (Beti, Betibe), a Kwa language whose other dialects are extinct, but whose remaining dialect is used by a fishing community on Aby Lagoon.

Iyer, L. Vishwanatha Ramaswami (1895–1948)

F Britto, Sophia University, Tokyo, Japan

L. Vishwanatha Ramaswami Iyer (also Aiyar) was born on October 25, 1895, in Thrissur, Kerala. He did his Intermediate (pre-university) studies as a State Scholar at Maharaja's College, Ernakulam. He received his B.A. (1914) in geology as a student of Presidency College, Chennai, and his B.L. (1916) in law, as a student of Law College, Chennai. After a brief period of legal practice and high school teaching, he earned an M.A. in English language and literature, and he joined his alma mater Maharaja's College on November 29, 1922, as an assistant professor of English. He spent the rest of his life at Maharaja's as a teacher and researcher, and died – aged only 52 – on January 31, 1948, in Thrissur, while on sick leave.

Known to his acquaintances as LVR, Iyer made lasting contributions to Dravidian Linguistics, even though he had no formal education in linguistics and his job required no mastery of Dravidian matters. With a flair for languages and a passion for linguistics, he learned as many as 18 languages (Indian and non-Indian, literary and non-literary), read avidly all the linguistics publications available to him, and refined his linguistics skills through personal contacts with several leading linguists, such as Suniti Kumar Chatterji. He preferred to write articles and monographs rather than lengthy books and published them in a wide variety of Indian and international journals. Limiting himself to Dravidian linguistics, he wrote – according to an estimate – nearly 200 articles on language evolution, word derivation, language reconstruction, phonetics, phonology, morphology, etymology, syntax, and semantics. His primary interests were Malayalam, Tamil, and Tulu, but he also wrote on and drew on many other languages such as Greek, Kannada, Telugu, Kui, Kuvi, Kurukh (Kurux), Gondi, and Brahui. He penned numerous book reviews and translated books and articles, including Romain Rolland's life of Gandhi from French to English.

The most noteworthy of Iyer's works are those he wrote on (1) *Lilatilakam*, a grammatical treatise of the 14th century, and its relation to Malayalam and Tamil; (2) the phonetics, phonology, morphology, and evolution of Malayalam; (3) the Dravidic Sandhi; (4) the language of ancient Tamil literature; (5) the Dravidian – especially Tamil – verbs; (6) the language features of Tulu, Kui, and Kurukh; and (7) comparative Dravidian and the evolution of Dravidian languages. His works are treasured even today for the abundant data they contain and for the creative ways in which Iyer manipulates them. Since no other linguist had explored Dravidian languages as thoroughly as he did, he was a pioneer in many areas of Indian linguistics, and he was acknowledged, even during his lifetime, as a leading authority on Indian philology. Linguists concerned with India, such as Murray B. Emeneau, Jules Bloch, and Thomas Burrow, have held Iyer's works in high esteem, and Kamil V. Zvelebil, another eminent Dravidolgist, says of Iyer's writings that they "contain rare insights, valuable data, and path-breaking ideas."

There exists no published compilation of all the articles that Iyer wrote, and his few books (e.g., Iyer, 1925, 1936, 1944) are out of print and hard to get. A volume edited by Subramoniam and Nair (1978) brings together the essays of five Dravidian linguists on the contributions and limitations of Iyer. It also has a large bibliography of Iyer compiled by Gopala Pillai.

J

Jaberg, Karl (1877–1959)

S N Dworkin, University of Michigan, Ann Arbor, MI, USA

Trained in Zurich under Emile Freymond and at the *École des Hautes Études* in Paris where he studied with Jules Gilliéron, Karl Jaberg spent his entire university teaching career (1907–1945) at the University of Bern. Dialect geography, lexical history, and semantics constitute the main components of his research and were masterfully combined in many of his historically slanted lexical studies. His dissertation (1901) dealt with the evolution of pejorative meanings in French, and his *Habilationsschrift* (1906) examined verbal inflection in a Franco-Provençal dialect. Unlike his teacher Gilliéron, Jaberg's work involved diachronic and comparative analysis of the synchronic distribution of lexical items. He was codirector (with Jakob Jud) of the *Sprach und Sachatlas Italiens und der Südschweiz* and the author of many studies on individual lexical items written from the perspective of diachronic onomasiology, *Wörter und Sachen*, and cultural history. In addition, Jaberg wrote on the broader methodological issues of dialect geography (see especially, Jaberg 1908, 1936; Jaberg and Jud, 1928). Questions concerning the psychological side of language as well as its affective and expressive use as a communicative instrument and how these characteristics could affect the formal development of a word also attracted Jaberg's attention. Toward the end of his career, he became interested in the effects on lexical history of popular beliefs and superstitions, e.g., his study on the Romance terms for the birthmark (Jaberg, 1957), his only piece published in English (original German version in Jaberg, 1965: 282–322).

Selections of Jaberg's essays have been collected in Jaberg (1937, 1965). Complete bibliographies of his writings are available in the supplement to Heinimann (1958: 9–18) and in Jaberg (1965: 325–334). Detailed discussion of his life and work can be found in Heinimann (1958), Malkiel (1959), Terracini (1959), Boléo (1960), and Hilty (1997).

Jackendoff, Ray S. (b. 1945)

J-M Fortis, C.N.R.S.– University of Paris 7, Paris, France

Ray S. Jackendoff was born on January 23, 1945, in Chicago (Illinois, USA). As a student of Chomsky, his work on syntax adopts the generativist framework. However, his interest for semantics has set him at the junction of multiple theoretical trends (generative grammar, cognitive science and semantics, philosophy of mind). He is now a professor at Brandeis University, near Boston.

In his first book (1972), he argued against specifying semantic conditions on transformations or representing semantic information in deep structure. Jackendoff defends a strict separation of syntactic processes and of semantic rules. He ascribes to the semantic component the function of relating deep structure to a semantic decomposition of lexical items and clauses and of providing rules of interpretation for anaphora, pragmatic structure, and arguments in modal contexts.

His activity veered thereafter toward syntactic matters. The outcome was a theory of phrase structure (1977), the X-bar syntax, in which all lexical categories were described as instantiating a common hierarchical pattern with three levels of constituency. X-bar syntax has since been incorporated in government and binding theory.

The idea that semantic generalizations must be formulated independently from syntactic ones was pursued in his *Semantics and cognition*. In this book, propositional representations ('conceptual structures' or CS) built out of semantic primitives clearly form a kind of *lingua mentalis*. Semantics, it is claimed, must ultimately reduce to cognitive psychology. CS also function as a *sensus commmunis*. Thus, visual and linguistic informations are said to communicate through CS. Most importantly, CS representing spatial relations are regarded as providing the machinery with which other fields (such as time or possession) can be conceptually organized and rendered expressible. The theory of CS is considerably elaborated in Jackendoff's 1990 book, which dealt with a number of semantic issues such as the conceptual representation of thematic roles, the description of different semantic fields (motion and causation), and the composition of CS of lexical items with those of adjuncts.

Since the 80s, Jackendoff's activity aims toward a description of the functional architecture of the language faculty and its interaction with other cognitive processes. His approach has remained remarkably consistent: the language faculty is segmented into three rule systems (on the phonological, syntactic, and conceptual levels) that communicate, through interface rules, with each other and with other processing systems (such as the perceptual systems). Two topics have been particularly explored: the relation of processing levels to conscious awareness (1987) and the interface with visual representations (notably the cerebral and cognitive constraints on the linguistic expression of spatial relations).

Jackson, Kenneth Hurlstone (1909–1991)

G Mac Eoin, National University of Ireland, Galway, Ireland

Kenneth Jackson was born in Surrey on November 1, 1909 to a business family. Having been educated locally, he was elected a scholar of St John's College, Cambridge, from which he graduated in 1931 in Classics. However, he switched to Celtic in the new department of Anglo-Saxon, Norse, and Celtic and graduated in 1933 with the Allen Research Student Scholarship, which was awarded to him again the following year. He spent his first year as a Research Student at the University of Bangor, North Wales, where he attended the lectures of Ifor Williams and Thomas Parry. The second year of his Research Studentship was spent in Dublin, where he studied under Osborn Bergin. He spent a month each year in Wales and in the Blasket Islands off the coast of County Kerry, Ireland. In both of these places, he began his publishing career with 'Coracle Fishing Terms' from Wales and '*Dhá Scéal ón mBlascaod*' from Kerry, which were published in 1933. He transcribed stories from Peig Sayers, the well-known storyteller of the Blaskets, in the International Phonetic Alphabet. He published during those years two books, *Early Welsh gnomic poems* and *Studies in early Celtic nature poetry* (both in 1935). On returning to Cambridge, he was elected Fellow of St John's College and appointed Lecturer in Celtic. In 1939, he was appointed Lecturer and later Associate Professor and Professor of Celtic at Harvard. During the war, he acted as censor on behalf of the British and American authorities in Bermuda. In 1950, he was appointed Professor of Celtic in Edinburgh, where he was to spend the rest of his life. By 1953, he had completed the work that was to bring him fame, *Language and history in early Britain*. This was an examination of the changes that took place in the early languages of Britain, in Anglo-Saxon, Irish Gaelic (Irish), Latin, and Welsh, from the 5th to the 7th centuries, their historical significance, and how they could be dated. It is a monumental work of scholarship. Jackson's next great work was *A historical phonology of Breton* (1967), an attempt to establish "a framework in which all the chief historical problems are raised and discussed." Again, it was a book of immense learning, but it has not received the same attention as *Language and history*, probably because of the limited number of scholars who study Breton in English-speaking countries. In addition to these works, Jackson edited a number of Irish and Welsh texts, principally *The Gododdin* (1969), *The Gaelic notes in the Book of Deer* (1972), and *Aislinge Meic Con Glinne* (1990), this last text containing the notes on Middle Irish that Jackson contributed as a replacement for the historical grammar of Irish that he had projected. Add to these a lecture that has led to much controversy, *The oldest Irish tradition: A window on the iron age* (1964), in which he claimed that the earliest Irish tales provide us with a vivid picture of life in the Iron Age, a claim hotly disputed. He died on February 20, 1991.

Jacobsen, Lis (1882–1961)

F Gregersen, Frederiksberg, Denmark

Elisabeth (Lis) Jacobsen, born on September 1, 1882 in Copenhagen, was a Danish runologist, language historian, lexicographer, and entrepreneur. Lis Jacobsen was born into the prominent Danish family of Jewish origins, the Rubins. Her cousin was the celebrated professor of psychology Edgar Rubin. While she was a student he and she joined a discussion group that included, among others, Niels and Harald Bohr. She was first educated as a teacher, but having married the philologist Jacob Peter Jacobsen in 1903, she began to study Nordic philology at the University of Copenhagen with his encouragement and was awarded the gold medal for a prize essay in 1908. She took her magister degree in 1908. In 1910 she was awarded the degree of doctor of philosophy for her dissertation on the sources of the Danish

Jackson, Kenneth Hurlstone (1909–1991)

G Mac Eoin, National University of Ireland, Galway, Ireland

Kenneth Jackson was born in Surrey on November 1, 1909 to a business family. Having been educated locally, he was elected a scholar of St John's College, Cambridge, from which he graduated in 1931 in Classics. However, he switched to Celtic in the new department of Anglo-Saxon, Norse, and Celtic and graduated in 1933 with the Allen Research Student Scholarship, which was awarded to him again the following year. He spent his first year as a Research Student at the University of Bangor, North Wales, where he attended the lectures of Ifor Williams and Thomas Parry. The second year of his Research Studentship was spent in Dublin, where he studied under Osborn Bergin. He spent a month each year in Wales and in the Blasket Islands off the coast of County Kerry, Ireland. In both of these places, he began his publishing career with 'Coracle Fishing Terms' from Wales and '*Dhá Scéal ón mBlascaod*' from Kerry, which were published in 1933. He transcribed stories from Peig Sayers, the well-known storyteller of the Blaskets, in the International Phonetic Alphabet. He published during those years two books, *Early Welsh gnomic poems* and *Studies in early Celtic nature poetry* (both in 1935). On returning to Cambridge, he was elected Fellow of St John's College and appointed Lecturer in Celtic. In 1939, he was appointed Lecturer and later Associate Professor and Professor of Celtic at Harvard. During the war, he acted as censor on behalf of the British and American authorities in Bermuda. In 1950, he was appointed Professor of Celtic in Edinburgh, where he was to spend the rest of his life. By 1953, he had completed the work that was to bring him fame, *Language and history in early Britain*. This was an examination of the changes that took place in the early languages of Britain, in Anglo-Saxon, Irish Gaelic (Irish), Latin, and Welsh, from the 5th to the 7th centuries, their historical significance, and how they could be dated. It is a monumental work of scholarship. Jackson's next great work was *A historical phonology of Breton* (1967), an attempt to establish "a framework in which all the chief historical problems are raised and discussed." Again, it was a book of immense learning, but it has not received the same attention as *Language and history,* probably because of the limited number of scholars who study Breton in English-speaking countries. In addition to these works, Jackson edited a number of Irish and Welsh texts, principally *The Gododdin* (1969), *The Gaelic notes in the Book of Deer* (1972), and *Aislinge Meic Con Glinne* (1990), this last text containing the notes on Middle Irish that Jackson contributed as a replacement for the historical grammar of Irish that he had projected. Add to these a lecture that has led to much controversy, *The oldest Irish tradition: A window on the iron age* (1964), in which he claimed that the earliest Irish tales provide us with a vivid picture of life in the Iron Age, a claim hotly disputed. He died on February 20, 1991.

Jacobsen, Lis (1882–1961)

F Gregersen, Frederiksberg, Denmark

Elisabeth (Lis) Jacobsen, born on September 1, 1882 in Copenhagen, was a Danish runologist, language historian, lexicographer, and entrepreneur. Lis Jacobsen was born into the prominent Danish family of Jewish origins, the Rubins. Her cousin was the celebrated professor of psychology Edgar Rubin. While she was a student he and she joined a discussion group that included, among others, Niels and Harald Bohr. She was first educated as a teacher, but having married the philologist Jacob Peter Jacobsen in 1903, she began to study Nordic philology at the University of Copenhagen with his encouragement and was awarded the gold medal for a prize essay in 1908. She took her magister degree in 1908. In 1910 she was awarded the degree of doctor of philosophy for her dissertation on the sources of the Danish

national norm. Typically, she argued that the language of the secular administrative body of the royal chancellery was more important for the creation of a Danish orthographical norm than was the bible translation of Christian III (1550). The work was intended to be the first volume in a comprehensive history of the Danish language, but Jacobsen soon realized that the sources needed for such a project were not available yet. In 1911 she consequently founded the Danske Sprog-og Litteraturselskab (DSL) as a society for the edition of dictionaries and early Danish texts. The DSL soon became, and has since then remained, the primary purveyor of critical editions of central Danish works as well as dictionaries based on a thorough examination of the available sources. Jacobsen never attained the affiliation with the university for which she was obviously qualified, but probably served the interests of the national linguistic scene better by creating her own power base outside the traditional institutions.

It takes a rather rare combination of fund-raising talents, organizational powers, and philological knowhow to be a linguistic entrepreneur on the grand scale, but Jacobsen had it all. She was vital in securing the establishment and quick completion of the great standard Danish dictionary *Ordbog over det danske Sprog* (*ODS*), published in 28 volumes from 1915 to1956, being its administrator and organizer from the beginning. She continued this line with the much smaller popular version *Nudansk ordbog* (*NO*), published in two volumes in 1952 and 1953, with a number of later editions. As a runologist, she completed the two-volume edition of L. F. A. Wimmer's *Danske Runeindskrifter* (with E. Moltke, 1941–1942) and wrote a classic paper on the interpretations and misinterpretations of runic inscriptions, 'Wimmers landmandsstene' (1926).

During the German occupation of Denmark she had to escape to Sweden, where she lectured on Danish and paved the way for the postwar Nordic cooperation between the national language boards. Jacobsen's vision of a history of Danish was meanwhile accomplished by her colleague Peter Skautrup in his five volumes on the history of the Danish language, *Det danske Sprogs Historie* (1942–1968), which was deeply and avowedly inspired by her sociolinguistic viewpoint and was published by the DSL. Nordic cooperation was also the key to the grand *Kulturhistorisk leksikon for nordisk middelalder* (1956–1978), which was conceived and planned by Jacobsen.

Jacobsen was first and foremost an organizer and entrepreneur, but she was also a linguist and philologist with a conception of language that united historical and sociolinguistic perspectives while respecting the traditional role of dialects in the Danish philological milieu. She ranks among the best linguistic authors with her refined style and her superb talent for fruitful polemics. She died on June 18, 1961.

Jagić, Vatroslav (1838–1923)

M N Dedaić, West Haven, CT, USA

Vatroslav Jagić was a famous Croatian philologist and a leading voice in Slavic philology during the late 19th and early 20th centuries. Jagić was born in the northern Croatian town of Varaždin on July 6, 1838, to a shoemaker's family. The trajectory of his professional life began when he left his hometown for Vienna to study classical philology and Slavic languages with Franc Miklošič, a famous teacher whom Jagić would succeed 25 years later. After graduation, he taught for nine years at a Gymnasium (high school) in Zagreb, Croatia, and after receiving a doctorate in philosophy from Leipzig University in Germany, Jagić was appointed Professor of Comparative Linguistics in Odessa, Ukraine. Three years later, in 1874, Jagić moved to Berlin, where he taught Slavic philology and revitalized interest for this discipline

national norm. Typically, she argued that the language of the secular administrative body of the royal chancellery was more important for the creation of a Danish orthographical norm than was the bible translation of Christian III (1550). Jagić, Vatroslav (1838–1923)

M N Dedaić, West Haven, CT, USA

Vatroslav Jagić was a famous Croatian philologist and a leading voice in Slavic philology during the late 19th and early 20th centuries. Jagić was born in the northern Croatian town of Varaždin on July 6, 1838, to a shoemaker's family. The trajectory of his professional life began when he left his hometown for Vienna to study classical philology and Slavic languages with Franc Miklošič, a famous teacher whom Jagić would succeed 25 years later. After graduation, he taught for nine years at a Gymnasium (high school) in Zagreb, Croatia, and after receiving a doctorate in philosophy from Leipzig University in Germany, Jagić was appointed Professor of Comparative Linguistics in Odessa, Ukraine. Three years later, in 1874, Jagić moved to Berlin, where he taught Slavic philology and revitalized interest for this discipline

among scholars. After six years in Berlin, Jagić spent another six years teaching at the university in Saint Petersburg, Russia, and in 1886 moved to Vienna as the successor to his teacher Miklošič. In that era, Vienna was the center of philology; Jagić's home, where he continued teaching Slavic seminars after retirement, was a gathering place for the most famous Central and East European Slavists of the time. In his later days, Jagić was appointed member of the Upper House of the Austrian Parliament.

Jagić's understanding of philology was manifested in the journal *Archiv für slavische Philologie* (*Archives for Slavic Philology*), which he established in 1875 with the intention to make it the principal forum for Slavic philology. Jagić's aim was to widen the borders of philology to include, besides language itself, linguistic and literary artifacts such as old scripts and monuments, as well as Slavic folklore and culture. Jagić was faithful to this goal during his 45-year editorial reign. At the time when Croatia was part of the Austro-Hungarian monarchy, Jagić embraced the political ideas and views of Bishop Josip Juraj Strossmayer, who believed that raising the level of a nation's culture is the only way to freedom. With Franjo Rački, Ivan Kukuljević, and others, Jagić worked on preserving Illyrian traditions under the South Slavic (Yugoslav) name. This orientation was exemplified by Jagić's interest in the life and work of Juraj Križanić (1618–1683), a Dominican priest who was known for his promotion of pan-Slavism and cooperation of the Catholic and Orthodox Churches. Jagić's most important publications (among about 600 attributed to him) are *Historija književnosti naroda hrvatskoga ili srpskoga* (*History of the literature of the Croatian or Serbian people), Tajni jezik u Slavena (Secret language among Slavs),* and *Prilozi slavenskoj sintaksi (Contributions to Slavic syntax)*. His studies of Old Church Slavonic argued that it did not originate in the central plains of Pannonia as most experts claimed, but rather in southern Macedonia. Jagić was also famous for his commentaries on mediaeval Slavic texts and correspondence of famous Slavic philologists (Dobrovski and Kopitar, among others). Jagić was influential as a literary critic, as he argued for realistic depiction of life in literature. He died on August 5, 1923, in Vienna, Austria.

Jakobson, Roman (1896–1982)

N Kerecuk, London, UK

Roman Jakobson (Figure 1), an American philologist and linguist of Russian Jewish descent, was born in Moscow. He moved to Prague in 1920 and to the United States during World War II. He graduated from Moscow University and participated in the Russian avant-garde movement in literature. When he moved to Prague, he pursued his doctorate at the University of Prague. From 1933 to 1939, he taught at the Massaryck University, Brno, but left Czechoslovakia during the Nazi occupation. He then traveled to Uppsala in Sweden, to Denmark, and to Norway before leaving for New York in 1941. He taught at the École Libre de Hautes Études, a French/Belgium free university accommodated by the New

Figure 1 Roman Jakobson (1896–1982).

School for Social Research in New York. He then taught at Columbia University (1943–1949) before becoming a professor at Harvard in 1949 and at MIT in 1957. In 1982, Jakobson died in Boston, Massachusetts.

He was a prolific author, and much of his work was dedicated to literary studies, but his role in the development of structural linguistics is also important. There have been many studies of his publications in English, in particular through the twentieth century, but significantly less of what he published in Russian has been examined. Most of these primary sources are now available for research.

In Moscow, Jakobson, along with the other young intellectuals, and G. O. Vinokur and P. Bogatyrev in particular, were involved in the creation of the Moscow Linguistic Circle, taking part in the debates that began to be developed in the second half of the nineteenth century on Slavic philology, poetics, dialectology, and folklore in the Old Russian Empire. After the death of F. E. Korsh (1843–1915), Jakobson chaired the Moscow Linguistic Circle until his departure for Prague. Traditionally, F. F. Fortunatov's Moscow School advocated a formal, logical approach to language study. A somewhat different treatment of the same themes predominated in St. Petersburg, where the OPOIAZ – Society for the Study of Poetic Language – was created in 1916 (it ceased to exist in 1923). Jakobson was a member of OPOIAZ, along with V. Shklosky, I. Tynianov, and B. Eikhenbaum. In St. Petersburg, the 'Kazan' School of J. Baudouin de Courtenay (1845–1929) and his disciples predominated. Both the Moscow Linguistic Circle and OPOIAZ are usually referred to as the Russian Formalists. However, influential studies in language, linguistics, and literature were not limited to these two centers in the Old Russian Empire and the Soviet Union: the city of Kharkiv, with its university, was fundamental, as was the legacy of O. O. Potebnia, with his disciples, in Moscow, St. Petersburg, and elsewhere, and the activities of the Historical-Philological Society (created in 1876).

After moving to Prague, Jakobson met Prince Nikolai Trubetzkoy (1890–1938) at a time when Prague was a hub of intellectual activity enabled by the intellectual climate fostered by T. G. Massaryk. Jakobson's main interests in the period continued to center on Slavic philology and literary studies. He was one of the founding members of the Prague Linguistic Circle, along with V. Mathesius (who was president until his death in 1945) and N. Trubetskoy, S. Karchevskii, and J. Murařosvký, among others. The Prague and Copenhagen centers became known as schools of structural linguistics. The former benefited from the Jakobson's move to the United States, where he promoted it.

The focus of Jakobson's writings during his Moscow and Prague periods is primarily aimed at literature, new art aesthetics, and philology (rather than linguistics), including Slavic philology, comparative philology, sound patterns and phonemics, literary language, the influence of folk literature on literature, folk songs, Futurism, aesthetics, poetics, versification, Russian and Slavonic culture and comparative mythology. It was after his arrival in the United States that Jakobson increased his output in phonology and, later, in linguistics, but he continued to describe himself as a Russian philologist.

There is still much research to be pursued on the evolution and sources of his ideas. For example, during the Moscow/Prague period, Jakobson wrote on literary themes and authors such as Trediakovsky (1915), Khlebnikov (1920, using his pen name R. A. [Roman Aljagrov] and for his own poetry), Maiakovsky (1931), Pushkin (1937), and Pasternak (1935).

Some of Jakobson's writings were dedicated to specific languages: Russian and its dialects, Czech, Bulgarian, and others. He also wrote on a number of linguists/philologists such as Durnovo (1926), Mathesius (1932), Shakhmatov (1920), and Peshkovskii (1933) (the latter two were disciples of O. O. Potebnia).

With P. Bogatyrev, he wrote on Slavic philology in Russia during the period of 1914–1921 (1922–1923). In the late 1920s, he produced two articles on phonetics and the phonological history of Slavonic languages. In 1931, he published a paper on the principles of historical phonology and entries on

'phoneme' and 'linguistics' for a Czech scientific dictionary in 1932 and 1935.

Jakobson was interested in identifying universals in languages, and he consequently disregarded relevant crucial differences. The idea of shared grammatical features as opposed to shared origin was part of his theory of universals. On the same basis, he postulated a development of the Slavonic verbal system (1932) based on a single stem. In 1936, he also published an article on the Russian/Slavonic case system based on the same idea. In 1938, he presented a paper on his theory of phonological affinities at the Fourth International Congress of Linguists in Copenhagen. In 1939, he wrote an article on the structure of phonemes. These pieces were the beginning of his work on phonology and linguistics.

In addition, in the 1920s and 1930s, Jakobson also had an interest in the sociology of language and national self-determination. These topics appeared in his papers in 1920–1921 and 1931. The latter year focuses on the proposed Eurasian linguistic union within the Eurasian ideological movement proposed by Russian émigrés in the 1920s and 1930s, characterized by an idiosyncratic linguistic and cultural approach.

His 1941 *Kindersprache, Aphasie und allgemeine Lautgesetze* (Jakobsen, 1971a: 328–401) has generated much research, as it suggests that there might be a universal order in the acquisition of speech sounds. His cooperation with N. Trubetskoi resulted in the furthering of the theory of distinctive features for the phonemes – the components of sounds. A phonetic feature distinguishes one phoneme from another (e.g., voiced/voiceless). The presupposition in this theory is that a set of features is applicable to distinguish phonological differences in all languages.

The concept of distinctive features, along with other concepts related to sound patterns, sound, and meaning, were expanded after Jakobson arrived in the United States. The Technical Report for the MIT Acoustics Laboratory, *Preliminaries to speech analysis* (1952) was jointly published with G. Fant and M. Halle. With Morris Halle, in 1956, in *Fundamentals of language*, the authors put forward the idea that a set of 12 binary oppositions, a bundle of 12 features, would be sufficient to give an account of all of the distinctions in all languages. The languages differ only in the manner that they combine these features. This contributed to the subsequent developments in phonological theory. For instance, A. Martinet outlined his views on Jakobson's phonology in his 'Substance phonique et traits distinctifs' (1957–1958).

Jakobson promoted the application of linguistics to literature. Some of the concepts that he used were those of iconicity, markedness, metaphor and metonymy, and communicative functions. He created a model of communicative functions based on the work of Karl Bühler and others. He argued that a shared code was not sufficient, but a context was essential in the communicative function. The components of communication are the addresser and the addressee and context, message, channel, and code. Therefore, depending on the focus of the component of communication, the functions are emotive (focuses on the addresser's attitude to his or her own message; e.g., interjections and emphatic speech), conative (focuses on the addressee; e.g., vocative), referential (refers to the context), phatic (refers to the contact/channel of communication between two speakers), metalinguistic (refers to the code itself, language about language; i.e., metalanguage), and poetic (refers to the additional component of a message apart from content). Each piece of discourse requires an analysis to identify which of the above functions predominate.

The seven volumes of Jakobson's *Selected writings* (1962–1984) offer an outline of the main areas of Jakobson's many interests. The correspondence of Jakobson with Trubetskoi and others in the interwar period (Toman, 1994) offers interesting insights into both the circulation of ideas and the characters of the personalities.

The acquaintance with C. Levi-Strauss has generated another strand of interaction and influence. The 1980 *Dialogues* with Krystyna Pomorska (his last wife) is another source. *The sound shape of language* with L. Waugh in 1986 represents another element in the history of Jakobson's thoughts. There are many publications on his life and works. Equally there is a great deal of comment about his works by Jakobson himself. Indeed, the accounts of intellectual histories in language sciences and the other areas that interested Jakobson are selective and have not been sufficiently researched. His eleven essays edited by K. Pomorska and S. Rudy (1985) *Verbal art, verbal sign, verbal time* are meant to be mainly an introduction to his works in poetics but also have relevance to his linguistic ideas.

Jakobson, Roman: Theory of the Sign

M Danesi, University of Toronto, Toronto, Canada

Introduction

Roman Jakobson (1896–1982), the Moscow-born linguist and semiotician who carried out most of his work in the United States, is perhaps best known for his model of communication (Jakobson, 1960) – a model that is based on a social-dynamic theory of the sign. A student of Russian linguist Nikolai Trubetzkoy (1890–1939), Jakobson was a founding member of the Prague Linguistic Circle in 1920 (Koch, 1981: 225–226). Most of his writings on semiotics were published in the 1960s and 1970s, during his professorship at Harvard University (e.g., Jakobson, 1960, 1966, 1970, 1971, 1974, 1978, 1985).

Theory of the Sign

Jakobson argued that the Saussurean view of the sign as an arbitrary structure – that is, one that has no motivation for being as it is through resemblance or simulation to its referent – was ultimately a useless one (*see* **Saussure: Theory of the Sign**). Taking his cue from Otto Jespersen (1860–1943), Jakobson saw signs as 'shifters' pointing to the cause and context of an utterance. Shifters are indicators of place (*here*, *there*), time (*now*, *then*), and specificity (*this*, *that*) that are context-sensitive.

The notion of shifter led to his model of communication, which has become widely used in both semiotics and linguistics. This consists of six constituents:

1. An addresser who initiates a communication;
2. A message that he or she wishes to convey and which he or she recognizes must refer to something other than itself;
3. An addressee who is the intended receiver of the message;
4. A context that provides the framework for encoding and decoding the message – e.g., the phrase 'Help me' takes on a different meaning depending on whether it is uttered by someone lying motionless on the ground or by someone in a classroom who is working on a difficult math problem;
5. A mode of contact (face-to-face, phone, etc.) by which the message is delivered between an addresser and an addressee;
6. A code (such as language, gesture, etc.) providing the signs for encoding and decoding messages.

Jakobson then pointed out that each of these constituents determines a different communicative function:

1. **Emotive**. This is the intent of the addresser in the communication act.
2. **Conative**. This is the effect the message has (or is intended to have) on its receiver.
3. **Referential**. This is any message that is constructed to convey information ('Main Street is two blocks north of here').
4. **Poetic**. This is any message constructed to deliver meanings effectively, like poetry ('I like Ike').
5. **Phatic**. This any message designed to establish, acknowledge, or reinforce social relations ('Hi, how's it going?').
6. **Metalingual**. This is any message that refers to the code used ('The word noun is a noun').

Conclusion

Jakobson's model suggests that sign use goes well beyond the function of simple information transfer. Signs are shifters that determine who says what to whom, where and when it is said, and how and why it is said; that is, sign use is motivated and shaped by the setting, the message contents, the participants, and the goals of each interlocutor. In-depth assessments of Jakobson's importance to semiotics can be found in Waugh (1976), Krampen (1981), and Eco (1985).

Jakovlev, Nikolaj Feofanovič (1892–1974)

O Molchanova, Uniwersytet Szczecinski,
Szczecin, Poland

Nikolaj Feofanovič Jakovlev was born in the village of Bulgarin (in the Saratov region of the Russian Federation) on May 19, 1894, and died in Moscow on December 30, 1974. A Russian linguist, he was one of the founders of the Moscow School of Phonology and a specialist in Caucasian languages and the theory of orthography.

Jakovlev graduated from Moscow University in 1916. He became a professor in 1946 and obtained his Ph.D. in 1947. He held various posts at the Institute of Linguistics of the USSR Academy of Sciences in Moscow from researcher (1936) to Head of the Caucasian Languages Department at the same Institute (1942–1950). Jakovlev was also a member of the All-Union central committee of a new alphabet.

Phonology in Russia dated back to the 1870–1880s and was founded by Baudouen de Courtenay. However, its general theory was formulated by Ščerba, Jakovlev, Trubeckoj, and Jakobson half a century later.

Since 1920 Jakovlev has organized and led fieldwork trips to the Caucasus to study Caucasian languages that did not have written tradition and were used only for oral communication.

In 1923, on the basis of a linguistically consistent theory of a phoneme worked out by him, Jakovlev devised a mathematical formula for inventing systems of characters with which Caucasian languages could be written. It opened up new horizons for 70 Caucasian peoples for whom a new alphabet was first introduced on the basis of Latin and later Cyrillic.

He has also shown serious interest in fundamental linguistic problems of Caucasian languages concerning their grammatical structure and lexicon, which led Jakovlev to writing a grammar of the Kabardian-Cherkes language (1948). During his fieldwork in the Caucasus he gathered materials for the Kabardian language dictionary and got it published in 1927.

Jamaica: Language Situation

P L Patrick, University of Essex, Colchester, UK

Jamaica's 2.6 million people mostly speak the English-lexified Jamaican Creole, known locally as Patwa. (The Ethnologue name, Southwestern Caribbean Creole English, is used by neither Jamaicans nor creolists.) Patwa is a language of strong ethnic and national identification, spoken abroad in Canada, the UK, and the United States by well over 500 000 people. (On distinctive British varieties, see Sutcliffe, 1982; Sebba, 1993.) Patwa constitutes the basilect and mesolect of a Creole continuum (DeCamp, 1971); it is largely unintelligible to nonJamaicans. The widely-spoken acrolect, Standard Jamaican English, has emerging written/standard norms (Shields, 1989; Sand, 1999); though native to a small minority, education is largely in English. Patwa has increasingly penetrated broadcast and print media since independence in 1962. Jamaican Sign Language, apparently related to ASL but with some BSL-derived signs, is used in deaf schools.

Patwa arose from British colonialism, African slavery, and the plantation economy (Le Page, 1960). It developed between 1655, when English soldiers captured Jamaica, and 1750 – a century of massive increase in the African population – though some important features are not attested for another century (Lalla and D'Costa, 1990). Standard Jamaican is a recognized national variety of English, genetically descended by normal transmission from British dialects. Basilectal Patwa differs radically from English grammar, and emerged from profound language

Jakovlev, Nikolaj Feofanovič (1892–1974)

O Molchanova, Uniwersytet Szczecinski, Szczecin, Poland

Nikolaj Feofanovič Jakovlev was born in the village of Bulgarin (in the Saratov region of the Russian Federation) on May 19, 1894, and died in Moscow on December 30, 1974. A Russian linguist, he was one of the founders of the Moscow School of Phonology and a specialist in Caucasian languages and the theory of orthography.

Jakovlev graduated from Moscow University in 1916. He became a professor in 1946 and obtained his Ph.D. in 1947. Jamaica: Language Situation

P L Patrick, University of Essex, Colchester, UK

Jamaica's 2.6 million people mostly speak the English-lexified Jamaican Creole, known locally as Patwa. (The Ethnologue name, Southwestern Caribbean Creole English, is used by neither Jamaicans nor creolists.) Patwa is a language of strong ethnic and national identification, spoken abroad in Canada, the UK, and the United States by well over 500 000 people. (On distinctive British varieties, see Sutcliffe, 1982; Sebba, 1993.) Patwa constitutes the basilect and mesolect of a Creole continuum (DeCamp, 1971); it is largely unintelligible to nonJamaicans. The widely-spoken acrolect, Standard Jamaican English, has emerging written/standard norms (Shields, 1989; Sand, 1999); though native to a small minority, education is largely in English. Patwa has increasingly penetrated broadcast and print media since independence in 1962. Jamaican Sign Language, apparently related to ASL but with some BSL-derived signs, is used in deaf schools.

Patwa arose from British colonialism, African slavery, and the plantation economy (Le Page, 1960). It developed between 1655, when English soldiers captured Jamaica, and 1750 – a century of massive increase in the African population – though some important features are not attested for another century (Lalla and D'Costa, 1990). Standard Jamaican is a recognized national variety of English, genetically descended by normal transmission from British dialects. Basilectal Patwa differs radically from English grammar, and emerged from profound language

contact, structural mixing and creolization between Africans and English speakers (Alleyne, 1988); it is not genetically descended from English, nor from African languages, though they are historically linked.

Table 1 Implicational scale: variable Patwa features[a]

Creole 'C':	*/ **d** /*	*/ **t** /*	*pikni*	*no ben*	*nana*	*nyam*
Speaker 4	C	C	C	C	C	C
Speaker 3	C	C	C	C	C	*e*
Speaker 7	C	C	C	C	*e*	*e*
Speaker 2	C	C	C	*e*	*e*	*e*
Speaker 6	C	C	*e*	*e*	*e*	*e*
Speaker 1	C	*e*	*e*	*e*	*e*	*e*
Speaker 5	*e*	*e*	*e*	*e*	*e*	*e*
English *'e'*	/ ð /	/ θ /	*child*	*didn't*	*granny*	*eat*

Adapted from DeCamp, 1971: 355.
[a]This table illustrates unidimensional Creole continuum for Jamaican Patwa. It uses six surface forms (three lexical, two phonological, and one syntactic) which are unrelated to each other, and charts their distribution for seven Patwa speakers, in an implicational display (see Rickford, 2002 for discussion of this device). For each item, the Patwa element at the top of the column is matched with its English equivalent at the bottom. The table does not attempt to represent individual variability or intermediate (mesolectal) elements, but it does successfully stratify each speaker into a separate cell, contrasting the acrolect to the basilect, with a range of intermediate patterns.

Creolists disagree whether a pidgin developed in Jamaica, or existed previously on the African coast and was relexified; or whether Patwa developed by abrupt creolization. African sources included Kwa and Bantu languages, especially Akan Twi, partially maintained by Jamaican Maroons, rebel Africans who achieved independence from England in 1739. The ritual Maroon Spirit Language resembles Suriname Creoles (Bilby, 1983). British sources include non-standard regional English dialects from London, Bristol, West Midlands, Liverpool, Scots and Irish English. Late-arriving migrants (post-1845) of Indian, Chinese, and Syrian heritage neither influenced the language's genesis nor evolved ethnic dialects.

Patwa exhibits some regional variants, especially in western Jamaica; more salient are urban/rural and social variation (Patrick, 1999). Patwa was long subordinated to standard English by an elite minority controlling power and official culture. Limited access for most Jamaicans to standard English resulted in the (post-)Creole continuum, a chain of minimally distinct varieties stretching from the acrolect to the basilect (DeCamp, 1971). Discrete, categorical approaches (community bilingualism, standard/dialect, and diglossia) have proven inadequate to describe the Jamaican language situation (Table 1).

Demographically, the mesolect – the intermediate range of speech varieties – dominates. It incorporates

[a]Table 2 has similar goals as Table 1, but does take into account individual variation and mesolectal elements. It displays part of the variability in past-marking among twelve individual speakers from the city of Kingston, for both preverbal invariant Creole markers of past reference (mesolectal *did*, and its negative counterpart *neva*) and English-like verb inflection. (Not all speakers use both.) Instead of focusing on the occurrence of unrelated surface forms, however, it identifies the relative strength of linguistic constraints – both Creole- and English-valued, phonological and grammatical – governing elements of the same grammatical subsystem: past-marking in the urban Patwa mesolect. Though each speaker does not have a distinctive pattern, a range of patterns does occur, including (for some speakers) both English-like phonological forms and contexts, and classic Creole constraints (anteriority and punctuality, which affect both the use of invariant preverbal particles and verb inflection, sometimes for the same speaker). The table demonstrates a systematic but variable mesolectal grammer, and ordered inherent variation within the Patwa mesolect.

elements of English structure within a systematic but variable Creole grammar: it lacks categorical agreement, but possesses many English forms and inflections, governed by both English and Creole linguistic constraints (Table 2). It shows strong, stable sociolinguistic patterns of speech production and evaluation, with highly focused Patwa norms but diffuse English norms (Patrick, 1999). It is not produced synchronically through language mixing (although Jamaicans do codeswitch and styleshift), but predates the basilect.

Fundamental reference works include a dictionary (Cassidy and LePage, 1967) and transformational grammar (Bailey, 1966); contemporary descriptions include Devonish (2004) and Patrick (2004).

Japan: History of Linguistics

H Eto, Yokohama, Japan

Historically, language study in Japan has had two main streams: foreign-language study for the purpose of assimilating various new forms of knowledge from abroad, and inquiry into the mother tongue to protect national identity and manifest the excellence of Japanese culture. From this viewpoint, the history of linguistic thought in Japan is characterized by three major landmarks. First, in the Nara and Heian periods (710–1192), in the stream of Chinese influence on the Japanese language, awareness of the mother tongue arose with national identity. Second, in the Edo period (1603–1867), while *kangaku* (classical Chinese learning) and *yogaku* (Western learning) thrived, the *kokugaku* (national learning) movement gained ground, focusing on textual and exegetical study of Japanese classical literature based on language study. Third, in the course of Westernization after the Meiji restoration (1868), the *kokugogaku* (scientific study of Japanese) school assimilated the fruits of Western linguistics into Japanese study and explored their own methods.

This article lays emphasis on the tradition of inquiry into foreign languages and the mother tongue by Japanese intellectuals and scholars, weighing up the aforementioned three major periods in the history of language thought in Japan.

elements of English structure within a systematic but variable Creole grammar: it lacks categorical agreement, but possesses many English forms and inflections, governed by both English and Creole linguistic constraints (**Table 2**). It shows strong, stable sociolinguistic patterns of speech production and evaluation, with highly focused Patwa norms but diffuse English norms (Patrick, 1999). It is not produced synchronically through language mixing (although Jamaicans do codeswitch and styleshift), but predates the basilect.

Japan: History of Linguistics

H Eto, Yokohama, Japan

Historically, language study in Japan has had two main streams: foreign-language study for the purpose of assimilating various new forms of knowledge from abroad, and inquiry into the mother tongue to protect national identity and manifest the excellence of Japanese culture. From this viewpoint, the history of linguistic thought in Japan is characterized by three major landmarks. First, in the Nara and Heian periods (710–1192), in the stream of Chinese influence on the Japanese language, awareness of the mother tongue arose with national identity. Second, in the Edo period (1603–1867), while *kangaku* (classical Chinese learning) and *yogaku* (Western learning) thrived, the *kokugaku* (national learning) movement gained ground, focusing on textual and exegetical study of Japanese classical literature based on language study. Third, in the course of Westernization after the Meiji restoration (1868), the *kokugogaku* (scientific study of Japanese) school assimilated the fruits of Western linguistics into Japanese study and explored their own methods.

This article lays emphasis on the tradition of inquiry into foreign languages and the mother tongue by Japanese intellectuals and scholars, weighing up the aforementioned three major periods in the history of language thought in Japan.

Language Awareness and National Identity

In a narrow sense, there was no systematic inquiry into language in Japan before the *kokugaku* movement of the 18th century. In spite of Japan's long and rich literary tradition, expanding from the 8th century, no equivalent to Dionysius Thrax can be found in the early and medieval periods. However, the people had a keen awareness of the linguistic uniqueness of their mother tongue, which was closely related to a consciousness of national identity against highly advanced foreign civilizations.

Belief in *Kotodama*, or the Miraculous Power of Words

Ancient Japanese people recognized the miraculous power of words and worshipped *kotodama* (the spirit of words). In *Man'yoshu*, an anthology of poetry compiled in the late 8th century, poets admired Japan as the land where the soul of language flourishes, and the preface to *Kokinwakashu*, the first collection of Japanese verse, compiled by royal command in about 905, stated: "Japanese poetry can move heaven and earth, induce the gods and demons to appreciate the beauties of nature, render men and women harmonious, and soothe the hearts of doughty warriors." It was thus strongly believed that the sacred and miraculous power of the native Japanese language, if expressed in the form of a *waka* (a 31-syllable Japanese poem) or a *norito* (a Shinto ritual prayer), could exert a significant influence on people, the entire world, and even the gods.

Chinese Influence and Language Awareness

The Japanese writing system is indebted to Chinese, and no indigenous script has ever been developed. *Kojiki* (*Record of ancient matters*, 712) was transcribed in Chinese characters solely as phonetic signs, and *Nihonshoki* (*Chronicles of Japan*, 720) was written perfectly in classical Chinese style. It was not until the 10th century that the two syllabaries, *katakana* and *hiragana*, which were developed out of simplified Chinese characters, were widely used throughout the country.

It is not clear when *kanji* (Chinese characters) first reached Japan, but the scholar Wani from the Korean peninsula is said to have brought 11 volumes of Chinese writings, including the *Analects of Confucius*, as early as the 4th century. While the Japanese people of that time introduced overwhelmingly higher systematized philosophy and religious dogma such as Confucianism and Buddhism, they continued to respect their own traditional values. In terms of language consciousness, they continued worshipping the miraculous power of their mother tongue and used *kanji* for the 'male' domain of learning and writing, for example, official documents, scholarly texts, and formal letters, and *yamatokotoba* (the pure native language written in *hiragana*) for expressing things spiritual, emotional, sentimental, etc. Describing love and human nature, Lady Murasaki's 11th-century *Genji-monogatari* (*The tale of Genji*) was written almost entirely in *yamatokotoba*.

Language Study as National Learning

The dichotomy of using classical Chinese as the medium of official and scholarly writing and pure Japanese, untainted and unfertilized by Chinese, for emotional content remained for many centuries. From the 9th century onwards, therefore, language study was confined to classical Chinese texts. In addition, after the arrival of Buddhism, phonological study of *Bongo* (Sanskrit) in Buddhist scriptures was conducted exclusively by Buddhist monks. In either case, Japanese was not considered appropriate as a subject of rigorous study.

The first group with a particular interest in the Japanese language was the Portuguese missionaries, mostly Jesuits, who came to Japan in the 16th century. The Jesuit priests reported back to Europe on the excellence of Japanese people and culture and published books to encourage systematic study of the Japanese language. But the works were written neither in Japanese nor in Chinese, but in Portuguese, and had no intrinsic influence on language study by Japanese intellectuals.

Prelude to the *Kokugaku* Movement

In the 17th century *kangaku* reached its peak. In particular, the *kogaku* (study of antiquity) school, established and fostered by Ito Jinsai (1627–1705) and Ogyu Sorai (1666–1728), exceeded the level of classical scholarship in China at that time, emphasizing the original trust of Confucianism and rejecting the dogmatic interpretation of the Confucian canon by the Neo-Confucian tradition from Chu Hsi. Their approach to the Chinese texts was shaped by a philological and exegetical rigor to examine the original meaning of the texts by means of removing the arbitrary interpretations and commentaries that might obscure the original teachings of Confucius.

In addition to the flourishing *kangaku*, *yogaku*, represented by *rangaku* (Dutch learning), was triggered by the encounter with the Dutch, the only Westerners who were allowed to engage in foreign

trade under the national seclusion policy of the Tokugawa government. For this new learning in various fields such as medicine, chemistry, military science, etc., the *rangaku* scholars depended entirely on textual interpretation of Dutch books based on a direct translation method, which resulted in the learning of Dutch grammar growing in popularity. The translation in 1774 of *Kaitaishinsho* (*New book of anatomy*) by Sugita Genpaku (1733–1817) and others from a Dutch original was a remarkable achievement of the *rangaku* school.

The *Kokugaku* Movement and Its Characteristics

In the 18th century a fierce nativist reaction emerged against the dominance of foreign studies. An especially strong opposition came from the *kokugaku* movement against *kangaku*. Traditionally, four scholars form the lineage of the orthodox *kokugaku* school: Kada no Azumamaro (1669–1736), Kamo no Mabuchi (1697–1769), Motoori Norinaga (1730–1801), and Hirata Atsutane (1776–1843). Through the textual and exegetical study of Japanese classical literature and ancient writings, the *kokugaku* scholars insisted, for the purpose of identifying and appreciating typical Japanese mentality and morality, on a return to *yamatogokoro* (original Japanese ways of thinking), that is to a time before Japan had been corrupted by *karagokoro* (Chinese ways).

Among these *kokugaku* scholars, Norinaga's achievement deserves special attention. Influenced by a monk of the Shingon sect, Keichu (1640–1701), the forerunner of *kokugaku*, Norinaga conducted a philologically oriented investigation of ancient Japanese thought and culture to explain the peculiarity and preeminence of *yamatogokoro*. Through his study of *Man'yoshu* and *Genji-monogatari*, he re-evaluated the *mono-no-aware* (sensitivity in literary creation) of the ancient Japanese people to refute the claims of Confucian rationalism introduced at a later stage.

Norinaga's greatest linguistic achievement is the *Kojikiden* (1764–1798), in which he not only explicated the ancient Japanese system of morality, but also succeeded in showing how to read the text of *Kojiki*, written in Chinese script, as phonetic signs for *yamatokotoba*. By means of studying the ancient language and literature Norinaga contrived to grasp intuitively the world that the ancient people experienced, an attitude which parallels the approach of German philologists of the 19th century. Norinaga's inductive method in philological and exegetical studies of Japanese classical literature provided a model for many succeeding generations of scholars.

In the Wave of Modernization: From the Traditional Method to Scientific Study

During the period of modernization in the late 19th and early 20th centuries, Japan learned eagerly from the West the ideal forms for promoting science and technology. The leaders in various areas of that period imported from Western countries what they considered the best. Besides *rangaku*, therefore, many other European languages, particularly English, German (Standard German), and French, became popular for the practical reason of digesting the various new accomplishments of learning. In this intellectual climate, the new wave of philology and linguistics rushed into Japan from the West and extended its influence over the entire academic world. First, foreign scholars invited to the imperial universities initiated modern linguistics, and subsequently their students and the *ryugakusei* (scholars and students studying abroad to absorb the most advanced findings of science and technology) played an important role in the department of *hakugengaku* (philology and linguistics), with which linguistic sciences in Japan commenced.

Western Influence on Japanese Linguistics

The new generation of Japanese scholars devoted themselves to Western linguistics and the scientific study of the Japanese language. They were under the strong influence of German historical and comparative linguistics.

Bun'yu Nanjo (1849–1927) and Junjiro Takagushu (1866–1945), scholars of Sanskrit and Buddhism, studied as *ryugakusei* Sanskrit grammar under the guidance of Friedrich Max Müller (1823–1900) at Oxford. Though Sanskrit was known to Buddhist monks as early as the 9th century, they began new Buddhist studies directly from the Sanskrit texts based on the comparative method, not through the Chinese translation or assistance.

Kazutoshi Ueda (1867–1937), the first professor of linguistics at Tokyo Imperial University and considered the father of modern Japanese linguistics, studied the comparative and historical method under the Neogrammarians at Leipzig and thereby provided the foundation of the *kokugogaku* school in Japan. He initiated the historical study of Japanese phonology and lectured on the history of Japanese linguistics, which was crucial in establishing the popularity of German linguistics, particularly Hermann Paul's *Prinzipien*. On this basis, various branches of Japanese linguistics were established by Ueda and his students, e.g., Katsuji Fujioka (1872–1935) in Altaic linguistics, Izuru Shinmura (1876–1967) in lexicology, Shinkichi Hashimoto (1882–1945) in Japanese

grammar, and Kyosuke Kindaichi (1882–1971) in Ainu philology. The next generation of linguists, Hisanosuke Izui (1905–1983) and Harushige Kodzu (1908–1973), concentrated more on Indo-European and European linguistics. The Western influence on Japanese linguistics and general linguistics in Japan was so great that almost all the major linguistic works in European languages were translated into Japanese. Ferdinand de Saussure's *Cours de linguistique générale* (1916) was translated by Hideo Kobayashi (1903–1978) in 1928, the world's first translation of the work.

In the *kokugogaku* school, some scholars took a stand against the attempts to schematize Japanese linguistics according to the Western model. From a psychological standpoint, Motoki Tokieda (1900–1967) advocated the theory of *gengokateisetu* (theory of language as a process) in opposition to the structuralists' perspective, notably to Saussure's concept of language. In the *kokugaku* school, Shinobu Orikuchi (1887–1953), following Norinaga's approach to text interpretation, established a folkloric approach to the essence of the Japanese psyche.

After World War II, the linguistic tendency in Japan shifted from European influence to American influence. The younger scholars studied Bloomfieldian linguistics and later Chomskyan linguistics, and applied their accomplishments to Japanese language study. In this sense, present-day linguistic study in Japan proceeds in parallel with the world's dominant stream.

Japan: Language Situation

S Iwasaki, University of California, Los Angeles, CA, USA

Japanese, as the official language of Japan, usually refers to the standard or common variety of the language. It was formed in the early 20th century, based on a variety of the Tokyo dialect. Establishing a standard language was essential at that time when Japan was modernizing itself after 250 years of isolationism. The standard language is the language of education and mass communication and is understood by over 126 million people throughout Japan.

The standard language is widespread, particularly in its written form. This does not mean, however, that the written convention has been completely formalized or stabilized. Since its establishment, the standard language has undergone various stages of modification, particularly in the area of *kanji* (Chinese characters) and *kana* (syllabary symbols) use. *Kana* symbols are phonetic in nature and are used together with *kanji* characters in sentences. However, until the end of World War II, these symbols represented the classical Japanese pronunciation. With the postwar reforms, they now reflect the sound of the modern language more accurately. A major problem in the writing system, however, has been the use of *kanji*, particularly its large inventory. Proposals were made to limit the number for practical purposes. The current 'List of Characters for General Use (*Toyo Kanji Hyo*)' recommends 1945 characters for daily use, though 3000 characters are used regularly in publications.

The use of honorific language and that of loanwords are also constant topics of debate for both

grammar, and Kyosuke Kindaichi (1882–1971) in Ainu philology. The next generation of linguists, Hisanosuke Izui (1905–1983) and Harushige Kodzu (1908–1973), concentrated more on Indo-European and European linguistics. The Western influence on Japanese linguistics and general linguistics in Japan was so great that almost all the major linguistic works in European languages were translated into Japanese. Ferdinand de Saussure's *Cours de linguistique générale* (1916) was translated by Hideo Kobayashi (1903–1978) in 1928, the world's first translation of the work.

In the *kokugogaku* school, some scholars took a stand against the attempts to schematize Japanese linguistics according to the Western model. From a psychological standpoint, Motoki Tokieda (1900–1967) advocated the theory of *gengokateisetu* (theory of language as a process) in opposition to the structuralists' perspective, notably to Saussure's concept of language. In the *kokugaku* school, Shinobu Orikuchi (1887–1953), following Norinaga's approach to text interpretation, established a folkloric approach to the essence of the Japanese psyche.

After World War II, the linguistic tendency in Japan shifted from European influence to American influence. The younger scholars studied Bloomfieldian linguistics and later Chomskyan linguistics, and applied their accomplishments to Japanese language study. Japan: Language Situation

S Iwasaki, University of California, Los Angeles, CA, USA

Japanese, as the official language of Japan, usually refers to the standard or common variety of the language. It was formed in the early 20th century, based on a variety of the Tokyo dialect. Establishing a standard language was essential at that time when Japan was modernizing itself after 250 years of isolationism. The standard language is the language of education and mass communication and is understood by over 126 million people throughout Japan.

The standard language is widespread, particularly in its written form. This does not mean, however, that the written convention has been completely formalized or stabilized. Since its establishment, the standard language has undergone various stages of modification, particularly in the area of *kanji* (Chinese characters) and *kana* (syllabary symbols) use. *Kana* symbols are phonetic in nature and are used together with *kanji* characters in sentences. However, until the end of World War II, these symbols represented the classical Japanese pronunciation. With the postwar reforms, they now reflect the sound of the modern language more accurately. A major problem in the writing system, however, has been the use of *kanji*, particularly its large inventory. Proposals were made to limit the number for practical purposes. The current 'List of Characters for General Use (*Toyo Kanji Hyo*)' recommends 1945 characters for daily use, though 3000 characters are used regularly in publications.

The use of honorific language and that of loanwords are also constant topics of debate for both

written and spoken forms of the standard language. Modern Japanese inherited a complex honorific system developed fully in medieval Japan, which emphasized the difference in the hierarchical social status among the speaker/writer, listener/reader, and referents. Modern Japan, however, has moved toward a more egalitarian society, and the honorific system has been simplified. The system is now more concerned with the treatment of the addressee according to the speaker's relationship with the addressee and the level of formality of the speech situation.

English became an important foreign language in the Meiji Period (1868–1912). It has been the most influential supplier of loanwords in Modern Japanese, especially after World War II. The majority of the loanwords, which is about 10% of the vocabulary used in the language, are from English. Loanwords are usually pronounced according to the Japanese sound system, but some are pronounced in more innovative ways. Some loanwords are firmly established in the lexicon (*/rajio/* < 'radio,' */batto/* 'baseball bat'), while others are not (*/akusesu/* 'access,' */hippu hoppu/* 'hip hop'). While the use of loanwords is a solution to the accommodation of new ideas and products that are entering the life of Japanese people at an increasingly faster pace, the overuse of loanwords in the area of public services has become a social concern. Attempts have been made to replace some new loanwords with semantically more transparent Sino-Japanese based words.

Though many Japanese can and do speak the standard variety, some may also use their own regional dialects for daily life in their community. Dialect areas are first divided between the mainland and Ryukyu (Okinawa). The mainland dialect area is further divided into eastern, western, and southern dialects. The eastern dialects are spoken from the eastern to northeastern part of Honshu, the largest of the four major islands, and include the 12 million speakers of the Tokyo dialect. The western dialects are spoken in the west and southwest part of Honshu and on the smallest major island of Shikoku. They include two important subdialects: Kyoto dialect, a descendant of the language used in much of the classical literature from the 8th through 16th centuries, and Osaka dialect with approximately 8 million speakers. The southern dialects are spoken on Kyushu Island, the southern most major island.

Ryukyu dialects are spoken on the Okinawan archipelago extending off Kyushu Island to the east of Taiwan. Ryukyu dialects are completely unintelligible to the speakers of other dialects. There are 1.3 million inhabitants, but monolingual speakers of the dialects have almost completely disappeared; those over 50 years of age are proficient both in a vernacular and the standard Japanese, while the younger generation is rapidly moving toward a state of monolingualism in standard Japanese.

The dialect of Hokkaido, the northern-most major island, is a mixture of other dialects due to immigration from different parts of Japan since the mid-19th century driven by the Japanese government's development policy.

Ainu was once spoken on this island. It is unrelated to Japanese, though its genetic affiliation is not established. While the number of people of Ainu ethnicity is estimated at 24 000 or more, there are only few living native speakers of the language, partly due to the government's earlier assimilation policy, which included a ban on the use of Ainu. However, the Ainu New Law of 1997 formally recognized this ethnic group as an indigenous minority, and there is now a government-supported revival movement for the language and culture of Ainu.

Among the foreign languages spoken in Japan, Korean, Chinese, and English have special places. Many Koreans came to Japan during the period of Japan's annexation of Korea (ending in 1945) and remained in Japan afterward. Koreans are now the largest minority group with 1 million people, but the number of ethnic Koreans who can speak the language has been diminishing in spite of the Korean community's effort to teach students in bilingual schools at different levels of education.

Although Japanese learn a large number of Chinese characters and use Sino-Japanese vocabulary extensively in writing and speech, few can use Chinese as a spoken language. This is due to a long tradition that treats the Chinese language as a language of high culture, and not for oral communication. There are 50 000 ethnic Chinese consisting of an older generation of Cantonese speakers and a newer generation of Mandarin speakers. The younger ethnic Chinese do not speak Chinese as their first language, and some attend Chinese language school to maintain their linguistic heritage. The recent upsurge in the number of migrant workers, students and returnees from various parts of China, however, has changed the demographic and linguistic profile of Chinese in Japan.

English is not used as a general means for oral communication, and the proficiency in English is limited despite the fact that most Japanese have studied English for 6 years by the time they graduate from high school. There have been movements to change this trend.

Japan: Writing System

J M Unger, The Ohio State University, Columbus, OH, USA

Description of the Current Writing System

The primary elements of modern Japanese writing are *kanji* 'Chinese characters' and two syllabaries called *hiragana* and *katakana* (collectively, *kana*). This mixture of character types is often described by saying that Japanese has three distinct scripts, but that is misleading. Any Japanese utterance can be written entirely in *hiragana* or *katakana*. Indeed, before 1945, either *hiragana* or *katakana* could be used as the default syllabary to supplement *kanji*. By contrast, not every Japanese utterance can be written with *kanji* alone. There once were forms of writing in which only *kanji* were used, but they are seldom encountered today. Moreover, modern spelling rules for *hiragana* and *katakana* differ, the two sets of *kana* are not freely interchangeable in ordinary usage, and roman letters and arabic numerals (A–Z, a–z, 0–9) as well as punctuation marks and typographical symbols of both Western and Japanese origin are now frequently used.

Kana

Despite the appellation 'syllabary,' the basic unit that *kana* represent is actually the mora. These are the so-called short vowels (V), with or without a preceding consonant (CV) or a consonant-glide combination (CyV); the mora nasal /N/ (a one-beat resonant with several conditioned allophones); and the mora obstruent /Q/, which precedes obstruents and causes a one-beat delay in their release. Japanese syllables consist of one or two (occasionally more) morae; the distinction between syllable and mora is essential for the description of pitch accent, present in most dialects but not indicated in standard orthography (for further details, see Vance, 1987).

Number and Form The two sets of *kana* contain 48 basic shapes, of which 47 are traditionally arrayed, as shown in **Table 1**. This arrangement, called the *gojūon-zu* or '50 sound chart' (despite its gaps), is first attested around 901. It is meant to be read from the upper right corner in Chinese style so that the order of morae is *a i u e o, ka ki ku ke ko, sa si su se so*, etc. This ordering was inspired by the *siddhaṃ* script for Sanskrit, and is currently the standard collating sequence for word sorting analogous to

Japan: Writing System

J M Unger, The Ohio State University, Columbus, OH, USA

Description of the Current Writing System

The primary elements of modern Japanese writing are *kanji* 'Chinese characters' and two syllabaries called *hiragana* and *katakana* (collectively, *kana*). This mixture of character types is often described by saying that Japanese has three distinct scripts, but that is misleading. Any Japanese utterance can be written entirely in *hiragana* or *katakana*. Indeed, before 1945, either *hiragana* or *katakana* could be used as the default syllabary to supplement *kanji*. By contrast, not every Japanese utterance can be written with *kanji* alone. There once were forms of writing in which only *kanji* were used, but they are seldom encountered today. Moreover, modern spelling rules for *hiragana* and *katakana* differ, the two sets of *kana* are not freely interchangeable in ordinary usage, and roman letters and arabic numerals (A–Z, a–z, 0–9) as well as punctuation marks and typographical symbols of both Western and Japanese origin are now frequently used.

Kana

Despite the appellation 'syllabary,' the basic unit that *kana* represent is actually the mora. These are the so-called short vowels (V), with or without a preceding consonant (CV) or a consonant-glide combination (CyV); the mora nasal /N/ (a one-beat resonant with several conditioned allophones); and the mora obstruent /Q/, which precedes obstruents and causes a one-beat delay in their release. Japanese syllables consist of one or two (occasionally more) morae; the distinction between syllable and mora is essential for the description of pitch accent, present in most dialects but not indicated in standard orthography (for further details, see Vance, 1987).

Number and Form The two sets of *kana* contain 48 basic shapes, of which 47 are traditionally arrayed, as shown in Table 1. This arrangement, called the *gojūon-zu* or '50 sound chart' (despite its gaps), is first attested around 901. It is meant to be read from the upper right corner in Chinese style so that the order of morae is *a i u e o, ka ki ku ke ko, sa si su se so*, etc. This ordering was inspired by the *siddhaṃ* script for Sanskrit, and is currently the standard collating sequence for word sorting analogous to

alphabetization. (Another collating sequence still occasionally encountered begins *i ro ha ni ho he to*, etc.)

In reading Table 1, note the following:

1. *Katakana* are shown to the right of the corresponding *hiragana* in the unshaded cells. The *kanji* from which the *kana* is/are believed to have arisen are shown underneath in shaded cells. Column headings give the initial consonant of the mora represented by the *kana* below (zero in the case of the first column); the row headings give the final vowel. N.B. /si/ = [ʃi], /ti/ = [tʃi], /tu/ = [tsɨ], /hi/ = [çi], /hu/ = [ɸɯ].
2. Morae of the form CyV are written by combining the appropriate Ci *kana* with a small version of the appropriate yV *kana*. For example, /kya/ きゃ キャ; /syu/ = [ʃɯ] しゅ シュ; /tyo/ = [tʃo̹] ちょ チョ. There once was a mora /kwa/, written くゎ and クヮ. This kind of digraphic notation has been extended to innovative morae such as /kwo/ クォ, /ye/ イェ, etc., which occur in new loanwords and so are seldom seen in *hiragana*.
3. A diacritic called *nigori* or *dakuten* indicates the voicing of an obstruent initial; e.g., /gi/ ぎ ギ; /zu/ ず ズ; /de/ で デ; and /bo/ ぼ ボ. Modern /h/ originated as /p/; hence the *kana* in the *h*-column are used for morae in *b*-. Modern /p/ is marked with another diacritic, called *maru* or *handakuten*; e.g., /pa/ ぱ パ.
4. The morae /wi we wo/ have merged with /i e o/. Only the *kana* for /wo/ is in current use (the *katakana* is seldom seen); see 'Historical Spellings' below.
5. The mora nasal /ɴ/ (usually romanized as syllable-final *n*) is written with *hiragana* ん and *katakana* ン (not part of the *gojūon-zu*). The mora obstruent /ǫ/ (usually romanized as a geminate) is notated with *hiragana* っ, *katakana* ッ – small versions of the *kana* for /tu/.

Function Since 1945, *katakana* have been used, like italics in English, for the transcription of unfamiliar loanwords and for emphasis; they were also used for writing telegram forms and are still seen in certain kinds of computer output. *Hiragana* are the default

kana for ordinary writing; they are used for postpositions, many adverbs, sometimes for nouns, and the variable endings of verbs and adjectives (in which case they are called *okurigana* 'send-off *kana*'). They are also the currently preferred *kana* set for notating the intended readings of *kanji* (*furigana*); e.g., the personal name 土井 can be Tsuchii or Doi, so it is sometimes necessary to write 土井(つちい) or 土井(どい) to make the reading clear. (Historically, *katakana* were adapted from *kanji* specifically to serve as *furigana*, but are thus used less often today.)

The modern notations for so-called long vowels and innovative morae in *hiragana* and *katakana* differ. For example, the syllable /too/ is written とう ⟨to u⟩ in *hiragana* (とお ⟨to o⟩ in a few words) but usually トー ⟨to ː⟩ in *katakana*, where the 'long' mark ー (*bō*) has no *hiragana* counterpart. Likewise, *hiragana* ねい ⟨ne i⟩ or, in a few words, ねえ ⟨ne e⟩ are both used for /nee/, whereas modern *katakana* usage prescribes ネー ⟨neː⟩. An example of an innovative mora is [ti]. In native and Sino-Japanese morphemes, /ti/ is realized [tʃi] and is represented by *hiragana* ち or *katakana* チ; to accomodate the [ti] some speakers produce in recent loanwords like [paːtiː] 'party' (cf. more conservative [paːtʃiː]), a new digraph notation is therefore used, viz. *katakana* ティ. (The parallel *hiragana* てぃ is possible but rare since innovative morae occur in loanwords.)

Kanji

In theory, any character used to write Chinese can be pressed into service in Japanese; but in practice, far fewer are actually seen. A handful known as *kokuji* 'national characters,' devised in Japan on the model of *kanji*, are usually lumped together with *kanji* despite their non-Chinese origin, e.g., 峠, which stands for the native word *tōge* 'mountain pass.'

Number and form The script reforms implemented in the period 1946–1959 included a governmentally authorized list of 1850 characters (the *tōyō kanji*) that capped the number to be used in official documents, educational curricula, and to a large extent in the public media. In 1980, the policy of limiting the number of *kanji* in general use was greatly weakened and a modified list of 1945 characters (the *jōyō kanji*) was issued. Despite this conservative backlash, however, *kanji* usage has been gradually declining for decades as the Japanese proclivity for borrowing new words has diluted its long-time cultural dependence on China. An analysis of 1 001 154 characters of running text in the 4245 Kyodo News Agency dispatches over 1 week in 1971 showed that only 46.1% of them were *kanji* even though those *kanji* accounted for 86.8% of the 2601 distinct character types in the same sample (Hayashi *et al.*, 1982: 206). Indeed, many *kanji* are seldom seen outside dictionaries: in 1963, the commonest 800 accounted for 90% of all those used in newspapers (Hayashi *et al.*, 1982: 245).

As part of the 1946–1959 reforms, the shapes of many of the *tōyō kanji* were simplified. Some changes were quite minor (adding or omitting a single stroke; connecting two disjoint strokes), but others were fairly drastic. For example, 沢 for 澤 (one reading of which is *sawa* 'mountain stream'), 昼 for 晝 (*hiru* 'noon'), 尽 for 盡 (*tsuku(su)* 'exert oneself, exhaust'). Although largely based on simplifications that had evolved in handwriting over the centuries, the Japanese changes are often different from the character simplifications later introduced in China. For instance, 傳 has been simplified to 伝 (*tsuta(eru)* 'tell, inform') in Japan but to 传 in the People's Republic of China.

Function Though the large number and complex shapes of the *kanji* used in Japanese are often remarked upon, the principal difficulty of the writing system lies in the fact that the typical *kanji* can take multiple 'readings.' Readings consist of one or more morae and generally fall into two categories: *kun* and *on*. *Kun* originated as glosses on *kanji*; they are Japanese words or parts of words that meant something like the literary Chinese words the *kanji* were used to write. *On* originated as Japanese attempts to pronounce Chinese syllables in different periods of history. The largest group, *kan-on*, were established in the 8th century; the less numerous *go-on*, accumulated in earlier centuries, now predominate in Buddhist terminology; a much smaller group, called *tōsō-on*, entered Japan together with Zen Buddhism in the 13th century; and there is a catch-all category called *kan'yō-on* 'customary *on*,' which lexicographers cannot otherwise explain. Today, *on* from different periods or *on* and *kun* may be found side by side within the reading of a single string of *kanji*.

The 1945 *jōyō kanji* can collectively take 2187 *on* and 1900 *kun*: 664 (34.1%) take just a single *on*; all the rest (apart from the few *kokuji* on the *jōyō kanji* list that take only one *kun*) have two or more readings (Hayashi *et al.*, 1982: 249–251). Moreover, the higher its frequency of occurrence, the more readings a *kanji* is likely to take, especially if allophonic variants are counted separately. For example, the heavily used *kanji* 日, usually read *hi* 'sun; day' in isolation, can also stand for the boldface portions of (in broad phonetics) [**ni**hon] or [**nip**pon] 'Japan,' [mai**nitʃi**] 'every day,' [**nik**ki] 'diary,' [**nitt**ʃuː] 'throughout the day,' [**niʃ**ʃoku] 'solar eclipse,' [**nis**seki] 'Japan Red Cross,' [sai**dʒitsu**] 'holiday,' [getsuyoː**bi**] 'Monday,' and [mik**ka**] '3 days; 3rd-day of a month.' In cases called *jukujikun* 'multiple character glosses,' two or

more *kanji* are glossed with a single native word that, at least synchronically, cannot be analyzed into a corresponding string of readings. This is the case, continuing the previous example, with 昨日 *kinō* 'yesterday,' 今日 *kyō* 'today,' 明日 *ashita* or *asu* 'tomorrow,' and such names as 春日 *Kasuga*, 日下 *Kusaka*, and 日向 *Hyūga*. The other side of this coin is the exploitation of an *on* or *kun* of a *kanji* to write part of a word with which it has no etymological connection. This kind of contrived usage (like English ⟨EZ⟩ for 'easy' or ⟨K9⟩ for 'canine') is called *ateji* and was especially popular in the Meiji period; e.g., *kurabu* 'club' (today just クラブ in *katakana*) was written 倶楽部 because the characters could be read individually as *ku*, *ra(ku)*, and *bu* and broadly hinted at the false etymology 'together + fun + place.'

A few *kanji* have readings that are, strictly speaking, neither *on* nor *kun*. The *kokuji* 働, which is 動 (an authentic *kanji*) with the addition of the so-called 'man' radical on the left, was invented to represent *hatara-* in the Japanese verb *hataraku* 'work'; later, with the pseudo-*on* *dō* (lifted from 動), it was used in the Sino-Japanese compound *rōdō* 労働 'labor'; cf. Chinese 勞動 (PRC simplified 劳动) *láodòng*. The readings *zero* 'zero' for 零, *pēji* 'page' for 頁, and *doru* 'dollar' for 弗 could likewise be called pseudo-*kun*.

Much psycholinguistic research has been devoted to the question of how readers apprehend and remember *kanji*. Although one continues to read that they function purely as logograms or even ideograms, the preponderance of evidence suggests otherwise (Matsunaga, 2002; Kess and Miyamoto, 1994, 1999; Paradis *et al*., 1985). The idea that *kanji* function logographically is made superficially plausible by the fact that a single native word, or a part thereof, can be used to gloss many different *kanji*. For instance, the verb *hakaru* はかる 'plan; measure; consult with' may also be written 図る, 計る, 測る, 量る, 諮る, or 謀る to emphasize the connotations 'design,' 'compute,' 'gauge,' 'size up,' 'confer,' or 'plot,' respectively, though in all likelihood, *hakaru* has always been a single polysemous verb, not a six-way homonym.

Moreover, what counts as the *kun* of a *kanji* is not always well defined. For instance, it is now common to write *wakaru* 'understand' 分かる, with 分 for *wa*, because, though the *-ka-* is invariant in all forms of this verb, it has a cognate *wakeru* 'divide, share.' But one still sometimes sees 分る, with 分 for *waka*. There are even some uninflected Sino-Japanese words that have become so nativized that they may be found entirely in *kana*; e.g., たいへん for 大変 *taihen* 'a lot.'

Punctuation, Alphanumerics, and Other Symbols

Japanese texts now regularly include a wide variety of symbols not covered by the rubrics of *kana* or *kanji*. Twine (1984) outlines the rise of punctuation in the Meiji period. For a description of the large number of symbols in the UNICODE standard counted as Japanese, see Lunde (1999).

Japanese texts are often formatted in traditional Chinese style. Vertical columns of characters run from the top of the page to the bottom, covering it from right to left. Page folds in this style are on the right side of the book, pamphlet, or newspaper. In much modern writing, the Western style has become more common, especially in academic work, where it frequently necessary to embed equations and other alphanumeric strings in Japanese-language text. Some Japanese symbols (e.g., *bō*) are rotated 90° counterclockwise to accommodate this format.

The most distinctive symbols are the Japanese comma 、and period 。, the word separator , *kana* repeat mark ゝ (ゞ when voicing is added), the *kanji* repeat symbol 々, and the paired quotation marks「 . . . 」and 『 . . . 』. (The Western pairing "..." has also been adapted in the form 〝...〟 in vertical format.) Especially in newspapers and magazines, abbreviations for units are often written as clusters of small *katakana*, e.g., kilo- ㌔, gram ㌘, meter ㍍, and percent ㌫. Besides the familiar (. . .) [. . .] { . . . }, many documents make graphic distinctions among a rich assortment of filled and outline bullets, and paired enclosure symbols, e.g.,【 . . . 】〔 . . . 〕〈 . . . 〉《 . . . 》. 'Right' and 'wrong' are conventionally ○ *maru* and × *peke* or *batsu*; with Chinese numerals, 〇 is used for 0. Also worth noting are the libel-dodging ○ ○ *maru-maru* 'so-and-so,' currency sign ¥ 'yen,' attention-grabbing ※ *komejirusi* 'rice sign,' and Post Office logo 〒 for 'postal code.' Encircled characters such ①②③, ㊤㊥㊦ 'top, middle, bottom' and ㊧㊨ 'left, right' are surprisingly common; icons like ☎ 'telephone number,' 📠 'fax number,' and 🖂 'mailing address' are gaining currency. The Japanese typographic imagination seems to know no bounds. (Many insights in Hansell's (2002) discussion of the integration of alphanumerics into Chinese writing carry over *mutatis mutandis* to Japanese.)

Alternative Methods

Two less common ways of writing Japanese should be mentioned if only because both belie the claim that the use of *kanji* and *kana* have rendered the Japanese insensitive to word boundaries. In both cases, the insertion of spaces between written words (*wakachigaki*) is an essential part of the system.

One is Japanese braille, which was developed in the 1880s and, unlike other braille systems, is based on *kana*. See Unger (1984) for further details, including a summary of braille *wakachigaki* rules.

The other is romanization, which now plays a more important part in Japanese writing than meets the

eye. Other than script reform advocates, few Japanese produce documents in romanized form, but because of word processors (*wāpuro*), a large and growing segment of the population types using a QWERTY-like keyboard. Although input systems are available that convert code numbers or keystroke sequences directly into individual *kanji*, *kana*, and other symbols, or allow the user to inscribe a character on a touch-sensitive tablet, the overwhelming majority of users input romanized Japanese and press function keys that instruct the software to convert these strings into the desired output characters. (Keyboards for *kana* typing are available but are used more by older, computer-shy novices.) Thus, from a psychological standpoint, most Japanese who use computers work in romanized Japanese even though they may never read extended romanized texts.

History of the Writing System

Apart from some artifacts produced in China that made their way to Japan in the early centuries of the first millennium, Chinese writing probably first came to Japan in the 5th century by way of visitors from the kingdom of Paekche, located in the southwest quadrant of the Korean peninsula. Attempts to explain the pictures found on bell-like bronze *dōtaku* of the Yayoi period (ca. 300 B.C.E.–300 C.E.) as primitive writing are unconvincing. The so-called *jindai moji* 'divine-age script' of Hirata Atsutane (1778–1843), sometimes still mentioned in crank literature, is obviously based on Korean *han'gŭl*, a product of the 15th century.

Origins of *Kana*

Kanji were used in many different ways in Old Japanese writing. The graphic deformation of those *kanji* used in the role now played by *kana* did not occur until the early 10th century. Before that time, *kana* were just ordinary *kanji* – now called *man'yōgana* after the 8th-century poetry anthology *Man'yōshū* – that were used to represent a mora (occasionally a string of two) because of a link between one of the readings of the *kanji* and the mora(e). In the 8th century, from which our oldest extant Japanese books date, several different *kanji* were used in the *kana* function for each syllable. Most of the *kanji* shown in Table 1 were typical *man'yōgana*. (*Hiragana* ん /N/ was derived from 无 after the *gojūon-zu* was already established. The source of *katakana* ン /N/ is uncertain, and sources other than those shown have been proposed for *katakana* ツ /tu/, サ /sa/, and *hiragana* つ /tu/.)

The number of the descendants of the different *man'yōgana* used for each syllable gradually dwindled over time, but as late as the 20th century, rival *kana* for the same syllable could be found in print. The now abandoned shapes are retroactively called *hentaigana* 'irregularly shaped *kana*.'

Historical Spellings (*Kanazukai*)

As might be expected, changes in *kana* spellings did not keep pace with changes in pronunciation over the centuries and became inconsistent as writers struggled to reconcile what they heard with the way they had learned to write. Until 1945, a system of rationalized etymological spellings, developed by late-18th/early-19th-century scholars, was in general use. The difference between this system and the one that has been in use (with a few minor changes) since the Occupation are shown in Table 2. Prewar Japanese were supposed to distinguish the *jō* of *jōdan* 'joke' じよう, *jōzu* 'skillful' じやう, *jōzetsu* 'verbose' ぜう, *jōbu* 'healthy' ぢやう, and *rokujō* '6 *tatami* [mats]' でふ in writing even though they all sounded alike. (Note also that the use of small versions of や *ya* ゆ *yu* よ *yo* did not become regularized until after the war.) Modern orthography has retained just a few anachronisms, most notably は *ha*, へ *he*, and を *wo* for the postpositions now pronounced *wa*, *e*, and *o*, respectively. Also, [dʒi] and [(d)zɨ] in the standard language are now written じ /zi/ and ず /zu/, respectively, in most contexts, although some of these syllables were once phonemically distinct /di/ and /du/ (still heard in some dialects), for which ぢ for /di/ and づ for /du/ are available.

Insofar as the modern spellings are much closer to present-day pronunciation, a great deal of Japanese phonological history can be surmised simply by comparing the old and new spellings. For example, original /p/ has lenited in initial position to /h/, with allophones [ç] before /i, y/, [ɸ] before /u/, and [h] elsewhere. In medial position, lenition caused /p/ to merge with original /w/; later, /w/ (from all sources) went to zero except before /a/. Most modern /p/ arose from a source other than original /p/; this is why /h/ rather than /p/ alternates with /b/ morphophonemically, just as /t/ alternates with /d/, /s/ with /z/, and /k/ with /g/. Of special importance is the analysis of *man'yōgana* usage, which shows that the language of the 8th-century capital area (Nara) had many more distinct syllables than later stages of the language (see Lange, 1973 for details).

Quasi-Chinese Methods

There are two obsolete methods of writing Japanese in which *kana* were used purely for annotational purposes or not at all. One is called *kanbun* 'Chinese text'. In principle, any literary (classical) Chinese text

ネイ ネエ ネー	nei, nē, nē	nei, nê, nê	nei, nê, nê
シリーズ	shiriizu	sirîzu	sirîzu

could be read in a variety of literary Japanese according to rules for glossing individual *kanji* (occasionally strings of *kanji*), supplying postpositions and grammatical endings as needed, and permuting the resulting phrases in conformance with Japanese syntax. In practice, although some Japanese writers understood how to write proper literary Chinese, aberrant varieties arose in Japan. *Kana* notations and a system of special punctuation marks came to be used to guide the reader in deciphering *kanbun*. Crawcour (1965) remains the best introduction in English.

Sōrōbun refers to an epistolary variety of *kanbun*, used from the 15th through 19th centuries, characterized by the heavy use of the polite auxiliary verb *sōrō* < *samurau* 'serve' (cf. *samurai* 'one who serves'). Kiyose (1983) is an easily accessible introduction to *sōrōbun*.

Romanization

The first romanization system for Japanese was created in the 16th century by Portuguese missionaries. It affords us an unusually clear view of Late Middle Japanese phonology. (There are also some contemporary *han'gŭl* transcriptions of Japanese that are helpful in this regard.)

Before the 1880s, romanization of Japanese words in the West was not standardized. Around 1885, two well-thought-out systems were proposed: the one used in the third edition of James Curtis Hepburn's Japanese–English dictionary, and the Nippon-siki system of Tanakadate Aikitu. The government proclaimed a compromise between these two systems by Cabinet Order (*kunrei*) in the 1930s, reconfirmed in the 1950s. Today, ISO Japanese romanization reflects this *kunrei-siki* standard; journalists, politicians, and academics in the West tend to cling to the Hepburn system despite the use of *kunrei-siki* among geographers, scientists, and (with some variations) linguists.

Table 3 shows the differences among the three principal systems. The three rows at the bottom illustrate the treatment of so-called long vowels within single morphemes. Adjacent vowels at morpheme boundaries are properly written out mora by mora: e.g., *suu* 'suck' ≠ *sū* or *sû* 'number'; *tou* 'ask' ≠ *tō* or *tô* 'east.' In Hepburn, *ii* is preferred even when there is no morpheme boundary between the two morae (e.g., the personal name Iida), but *ī* is sometimes seen anyway (e.g., for '[the letter name] E'). In all three systems, an apostrophe follows *n* for the mora nasal /N/ (*hiragana* ん) before *y* or a vowel.

Japanese

M Shibatani, Rice University, Houston, TX, USA

Japanese is spoken by virtually the entire population of Japan – some 128 million people in 2004. In terms of native speakers, the number easily surpasses the number of speakers of the major European languages (German and French), ranking sixth among the languages of the world, after Chinese, English, Russian, Hindi, and Spanish. Yet, among the major languages of the world, Japanese occupies a unique position in a number of respects. Unlike the languages spoken on the European, American, and Asian continents, the Japanese language, being spoken in an island nation, is physically isolated from other languages. Also, unlike major European languages such as English and Spanish, Japanese is primarily spoken within the confines of its national boundaries, with no other country using it as either a first or second language. Moreover, Japanese is the only major world language for which the genetic affiliation to other languages and language families has not been conclusively proved.

As in the case of other language isolates, including Basque and Burushaski (and the geographical neighbors of Japanese, Ainu and Korean) (*see* **Ainu** and **Korean**), the genealogy of Japanese has been a perennial problem that has attracted the attention of both specialists and laymen alike. Hypotheses have been presented assigning Japanese to virtually all major language families. Although attempts to relate Japanese to the Altaic family have been most systematic and perhaps most persuasive (*see* **Altaic Languages**) two views have attracted increasing attention in recent years: (1) that Japanese consists of an Austronesian substratum and an Altaic superstratum, and (2) that Japanese is an Austronesian–Altaic hybrid or mixed language, in which not only simple lexical mixtures but also morphological hybrids, e.g., Austronesian verb roots with Altaic inflectional endings, are recognized (*see also* **Austronesian Languages: Overview**).

Japanese

M Shibatani, Rice University, Houston, TX, USA

Japanese is spoken by virtually the entire population of Japan – some 128 million people in 2004. In terms of native speakers, the number easily surpasses the number of speakers of the major European languages (German and French), ranking sixth among the languages of the world, after Chinese, English, Russian, Hindi, and Spanish. Yet, among the major languages of the world, Japanese occupies a unique position in a number of respects. Unlike the languages spoken on the European, American, and Asian continents, the Japanese language, being spoken in an island nation, is physically isolated from other languages. Also, unlike major European languages such as English and Spanish, Japanese is primarily spoken within the confines of its national boundaries, with no other country using it as either a first or second language. Moreover, Japanese is the only major world language for which the genetic affiliation to other languages and language families has not been conclusively proved.

As in the case of other language isolates, including Basque and Burushaski (and the geographical neighbors of Japanese, Ainu and Korean) (*see* **Ainu** and **Korean**), the genealogy of Japanese has been a perennial problem that has attracted the attention of both specialists and laymen alike. Hypotheses have been presented assigning Japanese to virtually all major language families. Although attempts to relate Japanese to the Altaic family have been most systematic and perhaps most persuasive (*see* **Altaic Languages**) two views have attracted increasing attention in recent years: (1) that Japanese consists of an Austronesian substratum and an Altaic superstratum, and (2) that Japanese is an Austronesian–Altaic hybrid or mixed language, in which not only simple lexical mixtures but also morphological hybrids, e.g., Austronesian verb roots with Altaic inflectional endings, are recognized (*see also* **Austronesian Languages: Overview**).

Among individual languages, Ryukyuan, Ainu, and Korean are the strongest candidates proposed as possible sister languages; in fact, the Japanese–Ryukyuan connection has been firmly established, and Ryukyuan, spoken in Okinawa, is now considered to be a dialect of Japanese (*see* **Ryukyuan**). A Japanese–Ainu relationship has been hypothesized, but evidence is scanty. There have been attempts to make more systematic comparisons between Japanese and Korean, but even here reliable sets of cognates are extremely small in number.

Being a mountainous country with numerous islands, Japan is an ideal setting for fostering language diversification. Indeed, Japanese is extremely rich in dialectal variations, and different dialects are often mutually unintelligible. However, Japan is linguistically completely unified by a uniform writing system and by the spread of the standardized speech, based on the Tokyo dialect, making oral communication possible among speakers of different dialects. The long literary history of Japanese, which dates back to the 8th century, finds its root in the borrowing of Chinese characters as a means of transcribing Japanese. Simplification of Chinese characters gave rise to two kinds of syllabary, or kana, i.e., *hiragana* and *katakana*. In addition to Chinese characters and the two types of syllabary, the Japanese writing system includes the Roman alphabet, which was introduced in the late 16th century by Portuguese and Spanish missionaries. All four types of writing systems have been retained today, and it is not unusual to see contemporary Japanese sentences written with a mixture of all of them (*see* **Japan: Writing System**).

The historical contacts with foreign cultures have left strong marks in the Japanese lexicon, which is characterized by a high percentage of loanwords. Roughly 60% of the Japanese vocabulary consists of loanwords of Chinese origin, a figure comparable to the proportion of Latinate words in the English vocabulary. Among the non-Chinese loanwords, or roughly 10% of Japanese vocabulary, English loans stand out, often replacing older loans from Portuguese, Spanish, and Dutch as well as even some Chinese loans.

Another salient feature of the Japanese lexicon is the presence of a large number of sound symbolic or mimetic words, which depict not only the sounds of natural objects and animals but also the manners of action and even states of mind. Thus, a dog barks *wan-wan* and it pours rain *zaa-zaa*; an old man walks *yobo-yobo* 'wobbly' and an old lady chatters *peya-kutya*; and your head aches *zuki-zuki* 'throbbingly,' your stomach hurts *tiku-tiku* 'stingingly,' and your nerves are irritated *ira-ira*.

Segmental phonology of Japanese – at least the speech of Tokyo and surrounding areas – is rather simple, with five vowel phonemes /a e i o u/ and 16 consonantal phonemes /p t k b d g s h z r m n w j N Q/. A noteworthy feature of Japanese segmental phonology is the distinction between a syllable and a mora. A mora is a unit that can be represented by one letter of kana (a Japanese pseudo-character used in syllabic writing). A word such as *simbun* 'newspaper' consists of two syllables, but a Japanese speaker further subdivides the word into four units, *si*, *m*, *bu*, and *n*, which correspond to the four letters of kana used in the written form. The consonantal archiphonemes /N/ and /Q/ correspond to moraic consonants seen in words such as *simbun* 'newspaper,' *simpai* 'worry,' *hakkiri* 'clearly,' and *kossori* 'stealthily,' wherein the first segments of the consonant clusters, *m*, *k*, and *s*, constitute moras. Since these moraic consonants are homorganic to the following consonants, there is no contrast among them other than in terms of the nasality feature. And since the only consonant that ends a word is the moraic nasal *n*, the words *simbun*, *simpai*, *hakkiri*, and *kossori* are phonemicized, respectively, as /siNbuN/, /siNpai/, /haQkiri/, and /koQsori/. The units of syllable and mora each play important roles in the accentual system.

Japanese is arguably a tone language, wherein the pitch pattern can be high followed by low (HL) or low followed by high (LH). Pitch height alone distinguishes minimal pairs such as *hasi* (HL) 'chopstick' versus *hasi* (LH) 'bridge' and *ame* (HL) 'rain' versus *ame* (LH) 'candy'; however, the Japanese accentual system is characteristically different from archetypical tone languages of the Chinese type, in which it is necessary to specify the tone for each syllable. In the case of (Tokyo) Japanese, once the place of pitch drop for a given word or a minor phonological phrase is specified, the pitch shape can be fully predicted. Thus, *hasi* 'chopstick' and *hasi* 'bridge' can be specified as /ha'si/ and /hasi'/, respectively, so that in the former, high pitch drops after *ha*, whereas in the latter, all moras are high except for the initial one. A pitch drop in the latter form is observed only when it is followed by another element, such as the nominative particle *ga*, as in the minor phrase /hasi'ga/ (LHL) 'bridge NOM.' The word *hasi* (LH) 'edge' is representable as /hasi/ without any accent; indeed, there is no pitch drop here, even in a phrase such as /hasi ga/ (LHH) 'edge NOM.' Pitch changes occur at mora boundaries, and the accent marker indicating the location of pitch drop is assigned to the unit of syllable. For example, the three-mora, two-syllable word *ganko* 'stubborn' contains the accent marker in the initial syllable, /ga'Nko/, surfacing with the pitch shape of HLL. There is no word in which the second mora of the

first syllable carries the accent, such as /gaN'ko/, which would presumably be pronounced as LHL or HHL if the syllable were the unit of tone inflection.

Japanese is an agglutinative language with primarily suffixing morphology. Both verbs and adjectives inflect for tense, but they are distinguished by different tense suffixes: *mi-ru* 'see-PRES' and *mi-ta* 'see-PAST' versus *utukusi-i* 'beautiful-PRES' and *utukusi-kat-ta* 'beautiful-EXPL-PAST' (EXPL = expletive). In addition to the inflecting adjectives, adjectival nominals are similar in meaning to adjectives but, like nominal predicates, call for tense-carrying copula (COP) in their predicative function: e.g., *kirei-da* 'pretty-COP-PRES' and *kirei-da-tta* 'pretty-COP-PAST.' These tense suffixes combine with various auxiliary-type suffixes, often resulting in a fairly long verbal complex: *ika-se-rare-ta-gara-na-i* (go-CAUS-PASS-DESI-show-NEG-PRES) 'do not show signs of wanting to be made to go.'

Japanese syntax is consistently head-final. The basic word order is subject-object-verb: *Taroo ga hon o yonda* (Taro NOM book ACC read-PAST) 'Taro read a book.' Postpositional particles are used instead of prepositions, as in the example, wherein the nominative and accusative (ACC) particles *ga* and *o*, respectively, mark the subject and the object. Modifiers precede the heads that they modify: *takai hon* (expensive book) 'expensive book' [*Taroo ga katta*] *hon* ([Taro NOM bought] book) 'the book Taro bought,' *Taroo no ie* (Taro GEN house) 'Taro's house,' *sono hon* (that book) 'that book,' *san-satu no hon* (three-CLASS GEN book) 'three books,' *hayaku hasiru* (quickly run) 'run quickly,' *tabe-tai* (eat-want) 'want to eat,' *Taroo yori kasikoi* (Taroo than smart) 'smarter than Taro.' Subordinating conjunctions occur after subordinate clauses, which in turn come before main clauses: [*Taroo ga kita*]-*node minna ga kaetta* ([Taro NOM came]-because everyone NOM went home) 'Because Taro came, everyone went home.'

One of the most important aspects of Japanese grammar has to do with the topic construction. The topic particle *wa* attaches to various nominals and adverbials, yielding topic sentences that contrast with nontopic sentences in the following manner:

Nontopic sentence (1):

(1) Taroo ga Ziroo no hon o yonde-iru
Taro NOM Jiro GEN book ACC read-be
'Taro is reading Jiro's book'

Topic sentences (2) and (3):

(2) Taroo wa Ziroo no hon o yonde-iru
Taro TOP Jiro GEN book ACC read-be
'Taro is such that he is reading Jiro's book'

(3) Ziroo no hon wa Taroo ga yonde-iru
Ziroo GEN book TOP Taro NOM read-be
'Jiro's book is such that Taro is reading it'

The basic difference between topic sentences and nontopic sentences is that the former are statements about certain things, represented by topic nominals, and the latter are statements describing the occurrences of events. For example, nontopic sentence (1) describes the event of Taro reading Jiro's book. On the other hand, topic sentences (2) and (3), respectively, describe something about 'Taro' and 'Jiro's book.' Thus, sentence (1) answers a question such as 'What is happening?,' whereas sentences (2) and (3), respectively, would be used in answering questions such as 'What is Taro doing?' and 'Where is Jiro's book?' In Japanese, it is the *wa*-marked topic nominal that accurately represents the traditional Western definition of subject as something that is being talked about. The *ga*-marked subject nominal, on the other hand, is more consonant with the other definition of subject, namely, that it expresses an actor or agent. In other words, in Japanese, the two notional definitions of subject are distributed over two distinct syntactic relations, whereas in English and other European languages, these largely converge on the single subject nominal.

Japanese has no agreement marker, but it freely omits pronouns. Thus, the following type of exchange is not uncommon:

(4) *Oo kita ka* (Oh came Q) 'Oh (you) came?'

(5) *Un kita* 'Yeah (I) came'

Of course, the omissions of pronouns are permitted only when they are recoverable from the context; one type of clue for the recovery is found in the honorific endings. Humbling forms together with the polite (POL) ending such as *Mair-imasu* (go.HUMBLE-POL) 'go' and *O-tazune simasu* (HON-visit do-POL) 'visit' indicate (a) that the subject is either a speaker or someone close to the speaker (by use of the humbling forms) and (b) that the addressee is someone worthy of respect (by use of the polite ending). On the other hand, honorific forms with the plain ending, such as *Oide-ni naru* (go.HON-ADV become.PLAIN) 'go' and *Otazune-ni naru* (HON-visit-ADV become.PLAIN) 'visit' indicate (a) that the subject is other than the speaker and is someone worthy of respect (honorific forms) and (b) that the addressee is someone close to the speaker, to whom the speaker is not obliged to show respect (plain ending). Thus, both the addressee axis (for polite endings) and the referent axis (for honorific and humbling endings) control honorific phenomena independently, though they often converge, as when the addressee is also the referent of the subject nominal (*see also* **Honorifics**).

Another clue that helps identify the nature of the speaker is sentence final particles, some of which are

different for male and female speakers. The final particle (PART) *wa* is a typical female form, whereas *zo* occurs in rough male speech. Since these discourse particles occur in intimate speech, an expression such as *Mair-imasu wa* (go.HUMBLE-POL PART) '(I will) go' indicates that the subject is the speaker (humble form), that the addressee is someone worthy of respect (polite ending), and that the speaker is a woman who is on intimate terms with the addressee (final particle).

Thus, Japanese, though it lacks agreement markers, has a number of grammatical features that not only indicate the nature of the subject but also index the social relationships between the speaker and the addressee and between the speaker and the nominal referent, as well as the gender of the speaker. These features, on the other hand, require the speaker of Japanese to predetermine the social relationships between the speaker and the addressee and the nominal referent, so that appropriate combinations of honorifics and discourse particles can be chosen. Japanese, in other words, is a highly context-sensitive language in which individual expressions encode various factors that make up conversational contexts in which they are embedded.

Japanese Lexicography

Y Tono, Meikai University, Chiba, Japan

There are three broad categories of dictionaries for the Japanese language: (a) Chinese–Japanese character dictionaries (*Kanwa Jiten*), (b) Japanese monolingual dictionaries (*Kokugo Jiten*), and (c) specialized dictionaries (*Tokushu Jiten*), which include thesauruses and terminology dictionaries. In terms of lexicographical development, it would be fair to divide the chronology into four main periods or stages: (1) the dawn of premodern lexicography (900 A.D.–1868 A.D.), (2) Westernization and rapid development of modern lexicography before World War II (1869–1945), (3) expansion of the dictionary market and projects (1946–1999), and (4) the electronic age (2000–).

The Dawn of Premodern Lexicography (900 A.D.–1868 A.D.)

Development of Kanwa Jiten

The oldest of the three categories of dictionaries is the Chinese–Japanese character dictionary. In the 7th century, Buddhism was introduced into Japan by way of Korea. Because there was no indigenous writing system in Japan at that time, the Buddhist monks had to learn how to read and write Chinese by consulting imported Chinese monolingual dictionaries, such as *Erya* (爾雅), *Shuowen Jiezi* (説文解字), and *Yupian* (玉篇). Gradually they compiled a list of Chinese characters with Japanese translations, which grew into a genre of *Kanwa Jiten* (漢和辞典; Chinese–Japanese character dictionaries). The first Chinese character dictionary produced in Japan was the *Shinsen Jikyou* (新撰字鏡), compiled by a Buddhist monk, Shouju, probably between 898 and 901 A.D. Following the *Shinsen Jikyou*, numerous Chinese–Japanese character dictionaries appeared. Among those produced from the Heian period (794 A.D.–1185) through the Edo period (1600–1868), four stand out: *Tenrei Banshou Meigi* (篆隷万象名義, 30 vols., early 9th century[1]) by a Buddhist monk, Kukai; *Ruiju Myogi Shou* (類聚名義抄, 10 vols, late 11th century, author unknown); and *Jikyou* (字鏡) and *Wagokuhen* (和玉篇) (dates and compilers unknown). The primary aim of these dictionaries was to provide information on how to read Chinese characters and their translations by using the Japanese writing system (*Manyogana*, a set of Chinese characters developed in the 8th century to

[1]An electronic version of *Tenrei Bansho Meigi* has been developed in Japan. See further details at http://homepage3.nifty.com/shikeda/kkg178.html.

different for male and female speakers. The final particle (PART) *wa* is a typical female form, whereas *zo* occurs in rough male speech. Since these discourse particles occur in intimate speech, an expression such as *Mair-imasu wa* (go.HUMBLE-POL PART) '(I will) go' indicates that the subject is the speaker (humble form), that the addressee is someone worthy of respect (polite ending), and that the speaker is a woman who is on intimate terms with the addressee (final particle).

Thus, Japanese, though it lacks agreement markers, has a number of grammatical features that not only indicate the nature of the subject but also index the social relationships between the speaker and the addressee and between the speaker and the nominal referent, as well as the gender of the speaker. These features, on the other hand, require the speaker of Japanese to predetermine the social relationships between the speaker and the addressee and the nominal referent, so that appropriate combinations of honorifics and discourse particles can be chosen. Japanese, in other words, is a highly context-sensitive language in which individual expressions encode various factors that make up conversational contexts in which they are embedded.

Japanese Lexicography

Y Tono, Meikai University, Chiba, Japan

There are three broad categories of dictionaries for the Japanese language: (a) Chinese–Japanese character dictionaries (*Kanwa Jiten*), (b) Japanese monolingual dictionaries (*Kokugo Jiten*), and (c) specialized dictionaries (*Tokushu Jiten*), which include thesauruses and terminology dictionaries. In terms of lexicographical development, it would be fair to divide the chronology into four main periods or stages: (1) the dawn of premodern lexicography (900 A.D.–1868 A.D.), (2) Westernization and rapid development of modern lexicography before World War II (1869–1945), (3) expansion of the dictionary market and projects (1946–1999), and (4) the electronic age (2000–).

The Dawn of Premodern Lexicography (900 A.D.–1868 A.D.)

Development of Kanwa Jiten

The oldest of the three categories of dictionaries is the Chinese–Japanese character dictionary. In the 7th century, Buddhism was introduced into Japan by way of Korea. Because there was no indigenous writing system in Japan at that time, the Buddhist monks had to learn how to read and write Chinese by consulting imported Chinese monolingual dictionaries, such as *Erya* (爾雅), *Shuowen Jiezi* (説文解字), and *Yupian* (玉篇). Gradually they compiled a list of Chinese characters with Japanese translations, which grew into a genre of *Kanwa Jiten* (漢和辞典; Chinese–Japanese character dictionaries). The first Chinese character dictionary produced in Japan was the *Shinsen Jikyou* (新撰字鏡), compiled by a Buddhist monk, Shouju, probably between 898 and 901 A.D. Following the *Shinsen Jikyou*, numerous Chinese–Japanese character dictionaries appeared. Among those produced from the Heian period (794 A.D.–1185) through the Edo period (1600–1868), four stand out: *Tenrei Banshou Meigi* (篆隷万象名義, 30 vols., early 9th century[1]) by a Buddhist monk, Kukai; *Ruiju Myogi Shou* (類聚名義抄, 10 vols, late 11th century, author unknown); and *Jikyou* (字鏡) and *Wagokuhen* (和玉篇) (dates and compilers unknown). The primary aim of these dictionaries was to provide information on how to read Chinese characters and their translations by using the Japanese writing system (*Manyogana*, a set of Chinese characters developed in the 8th century to

[1]An electronic version of *Tenrei Bansho Meigi* has been developed in Japan. See further details at http://homepage3.nifty.com/shikeda/kkg178.html.

be used as phonetic symbols to represent Japanese syllables, and *katakana* and *hiragana*, a system of 48 syllabic writing units for writing non-Chinese loan words and indigenous Japanese words, respectively).

Development of Kokugo Jiten

Because Chinese–Japanese character dictionaries were not able to describe Japanese indigenous words, there was a pressing need for Japanese monolingual dictionaries. One of the earliest extant examples of such a dictionary is the *Iroha jirui shou* (色葉字類抄), compiled by Tachibana no Tadakane between 1174 and 1181. It is a prototype of similar dictionaries in use today. Unlike Chinese character dictionaries, its entries are arranged according to sound (using *iroha* poetry) rather than Chinese characters. Nowadays most monolingual dictionaries are generally arranged on the basis of the standard *gojyuon* (50-sound) system. Notable examples of premodern monolingual dictionaries produced from the late Muromachi period (1333–1568) to the late Edo period include: *Setsuyoushu* (節用集; the first one was compiled in the mid-Muromachi period, with various subsequent versions appearing throughout the Edo period); *Wakun no shiori* (和訓栞, compiled by Tanikawa Kotosuga in the mid-Edo era; the first monolingual dictionary arranged in the *gojyuon* system); and *Gagen shoran* (雅言集覧, compiled by Ishikawa Masamochi from 1826–49; revised by Nakajima Hirotari in 1887; the first monolingual dictionary illustrating the meanings of old Japanese words with examples from authentic texts) (Kimura, 2002).

Early Western Influence

In the Azuchi-Momoyama (1573–1597) and the Edo (1600–1868) periods, lexicographical methods used in Europe were introduced through the Europeans who had contact with the Japanese under special circumstances. Among them were the Jesuit missionaries who compiled bilingual dictionaries such as *Rahonichi Jisho* (*Dictionaricum Latino-Lusitanicum ac Iaponicum,* 1595) and *Nippo Jisho* (*Vocabulario lingua de Iapam com adeclaraa em Portugues,* 1603). During the Edo period, the Netherlands was the only country that was allowed to have trade relations with Japan. People learned *Rangaku* (i.e., Dutch studies) in order to absorb Western culture. Inamura Sanpaku and others translated François Halma's Dutch–French dictionary, *Woordenboeck der Nederduitsche en Fransche Taalen* (1708), and compiled a Dutch–Japanese bilingual version called *Halma Wage* (波留麻和解, published in 1796; 80 000 entries). This version was called 'Edo Halma,' while the one translated later in 1816 by Hendrick Doeff, head of the Dutch trading post at Nagasaki, was called 'Nagasaki Halma.' The latter version was never printed, and students at the Tekijuku academy of Dutch studies in Osaka made their own manuscript copies. It was later revised by Katsuragawa Hoshu and published under the title *Oranda jii*.

It was not until the introduction of Western lexicography in the Meiji era that Japanese lexicography began its modern phase of development. One of the most influential dictionaries was James Curtis Hepburn's Japanese–English dictionary *Waei Gorin Shusei* (和英語林集成; 1867; Japanese–English: 20 772 entries; English–Japanese and: 10 030 entries). Due to its systematic description of Japanese words, this dictionary not only influenced other bilingual dictionaries (Japanese–German and Japanese–French, among others) but also had a great influence on the development of Japanese monolingual dictionaries. The third edition (Japanese–English: 35 618 entries; English–Japanese: 15 697 entries), which appeared in 1886, was especially famous as it introduced Hepburn's Romanization, a transliteration scheme for writing Japanese, for the very first time. This Romanization system became the standard in Japan and is still used today.

Westernization and Rapid Development of Modern Lexicography (1869–1945)

Meiji Restoration and Educational Reform

Two important watersheds in the development of Japanese dictionaries occurred in the late 19th and early 20th centuries. One was the introduction of foreign dictionaries and lexicographical methods in the late Edo period. The other was the system of compulsory education instituted in the early Meiji period (1868–1912). Because of this education reform, mass production of all types of dictionaries took off in Japan.

Among the dictionaries compiled during this period, *Genkai* (言海, edited by Otsuki Fumihiko) was the most influential and ambitious (Yamauchi, 1965). It originally started as a government-led lexicographical project. After the Meiji Restoration, the new government wished to have a new unabridged monolingual dictionary. This was influenced by linguistic nationalism in major Western countries, which had led to large-scale monolingual dictionary projects (e.g., the *Oxford English dictionary* in the United Kingdom, Grimm's *Deutsches Wörterbuch* in Germany, Webster's *An American dictionary of the English language* in the United States, and Littré's *Dictionnaire de la langue française* in France). The

government appointed around 10 Japanese language scholars for this work, and the first section of what was then called *Goi* (語彙) was published in 1871. The project had to be terminated, however, due to the lack of government funding and conflicting editorial policies among the team members. Otsuki Fumihiko was asked by the Education Ministry to take over this job in 1875 and spent 17 years completing the rest of the dictionary almost single-handedly. The first edition was published in 1889, and robust sales resulted in more than 500 printings by the beginning of the Showa period (around 1930).

Genkai was roughly based on Webster's dictionary in terms of its editorial policy. The criteria for selecting and organizing entries, especially for inflected forms, compound words and idioms, were much more refined and scientific than in previous dictionaries. It contained 39 103 entries, each of which consisted of information such as pronunciation, part of speech, word origin, senses, and citations. In particular, the structure of the entries became more scientific; definitions were ordered on historical principles and supplied with illustrative examples wherever possible. If a firm definition or explanation could not be fully established, a phrase such as *to iu ha ikaga* (i.e., 'suggested') was added after the description. Japanese linguistics was still in its infancy at that time, and the objective attitude adopted in the dictionary toward the description of the language became an important milestone in its development. *Genkai* was highly regarded and welcomed by scholars and became the most authoritative dictionary during the Meiji era, with a high academic standing among Japanese scholars and the general population alike. Most modern Japanese dictionaries are still influenced by *Genkai* to some extent.

After *Genkai* set the standard for medium-sized Japanese monolingual dictionaries, many attempts were made to match or even surpass this work. Among these attempts were *Jirin* (辞林, 1907; revised as *Kojirin* in 1925) by Kanazawa Shozaburo, *Jien* (辞苑, 1935) by Shinmura Izuru, and *Jikai* (辞海, 1952) by Kindaichi Kyosuke.

The publication of *Genkai* encouraged publishers to provide more thorough descriptions of the Japanese language, which led to some attempts to publish more comprehensive, unabridged dictionaries. For instance, *Genkai* was later revised and updated by Otsuki's successor, Okubo Toshio, and other Japanese language scholars at the University of Tokyo. This enlarged version was entitled *Dai-Genkai* (大言海, 4 vols, 1932–37; c. 80 000 entries). Other unabridged dictionaries in the early 20th century include *Dai Nihon Kokugo Jiten* (大日本国語辞典, 4 vols, edited by Matsui Kanji & Ueda Kazutoshi, 1915–19; c. 220 000 entries; most examples with references), *Nihon Daijiten Gensen* (日本大辞典言泉, by Haga Yaichi, 1921–29; many encyclopedic entries), and *Daijiten* (大辞典, 24 vols, by Heibonsha, 1934–36; encyclopedic in nature).

Expansion of the Dictionary Market and Projects (1946–1999)

After World War II, Japan needed some time to recover from its chaotic state. In the 1950s, however, rapid recovery and economic growth encouraged dictionary publishers to produce dictionaries capitalizing on their prewar heritage. *Jien* (1935), for example, was revised and updated and renamed *Kojien* (広辞苑, edited by Shinmura Izuru, 1955; 200 000 entries), which became a best-selling medium-sized monolingual dictionary for a long time.

Major dictionaries published in the latter half of the Showa period are:

- *Jikai* (辞海, edited by Kindaichi Kyosuke, 1952; 130 000 entries)
- *Shincho Kokugo Jiten* (新潮国語辞典, edited by Yamada Toshio, 1965; 130 000 entries)
- *Nihon Kokugo Daijiten* (日本国語大辞典, edited by Kankokai, 1972–1976; 450 000 entries)
- *Gakken Kokugo Daijiten* (学研国語大辞典, edited by Kindaichi Haruhiko and Ikeda Yosaburo, 1978; 100 000 entries)
- *Kadokawa Kokugo Daijiten* (角川国語大辞典, edited by Tokieda Motoki *et al.*, 1982; 155 000 entries)
- *Gensen* (言泉, edited by Hayashi Oki, 1986; 150 000 entries)
- *Daijirin* (大辞林, edited by Matumura Akira, 1988; 220 000 entries)
- *Kodansha Color Nihongo Daijiten* (講談社カラー版日本語大辞典, edited by Umesao Tadao *et al.*, 1989; 175 000 entries).

One of the largest and most comprehensive dictionaries is the 20-volume *Nihon Kokugo Daijiten* completed by Shogakukan Publishing Co. Ltd. in 1976. This project was ambitious in the sense that they designed the dictionary with the *Oxford English dictionary* as their model, with not only definitions for the entries but also information on their origins and citations showing a chronological range of meanings, from the time the word entered the language to the present. It contains 450 000 entries, with 750 000 illustrative examples from more than 30 000 references. Detailed descriptions are provided for pronunciation variants (regional differences in accents), and more than one etymology is given for words of uncertain origin. Definitions in this dictionary are ordered according to word-sense derivation, and citations are

given with clear references. It is also noteworthy that this dictionary makes reference to all the major Japanese dictionaries published before the Meiji period to indicate whether the given word was already listed in those dictionaries (Kurashima, 1997).

Nihon Kokugo Daijiten was welcomed enthusiastically by the Japanese public as an authoritative monolingual dictionary. The second edition was published in 2001 (500 000 entries; 1 million citations) and is the biggest monolingual Japanese dictionary published so far.

During this period, hundreds of monolingual Japanese dictionaries were produced, catering to all the different sectors and niches of market. The major trends in modern Japanese lexicography can be summarized as follows.

1. Attention has shifted away from mere explanations of difficult terms to more careful linguistic descriptions of ordinary words. Unabridged monolingual dictionaries in Japan used to cover classical words and phrases more fully and provided rather sparse treatment of modern usage and vocabulary. Even the most popular dictionary, *Kojien* (1995), had ordered word senses on historical principles. Its rival, *Kojirin*, on the other hand, lists the most recent senses first, beginning with modern usages and working backward to the word's origins. Nowadays, even small, compact dictionaries deal with everyday words in some detail.
2. Illustrative examples are now also taken from modern texts. Citations used to be from classical literature and were given only for the more difficult terms. Contemporary dictionaries use more examples from contemporary texts.
3. There has been a growing awareness that the needs of the end user should be taken into account in designing a dictionary. This is shown in the fact that monolingual dictionaries designed especially for schoolchildren now focus on more productive knowledge of vocabulary (everyday expressions, collocations, word choice, etc.).

This period was also characterized by the publication of more Chinese-character dictionaries and various types of terminological dictionaries. Of the numerous *kanwa jiten* published for general use, the following achieved a particularly wide circulation: *Kanwa Daijiten* (1903), jointly compiled by Shigeno Yasutsugu, Mishima Takashi, and Hattori Unokichi (1867–1939), and *Daijiten* (1917), by Ueda Kazutoshi. The most comprehensive of the modern kanwa jiten is the *Dai Kanwa Jiten*, compiled by Morohashi Tetsuji and published in 1955–60.

By the year 2000, there were already more than 2500 terminological dictionaries available. Some are general dictionaries with a special emphasis on certain technical fields, whereas others are more like lists of terminology along with translation equivalents and brief comments. There are dictionaries that deal exclusively with recently coined words, slang, trade terms, place and personal names, recently introduced loan words, acronyms, sports and leisure activities, and so on. Field-specific dictionaries exists for such subjects as mathematics, physics, chemistry, computer science, linguistics, Japanese literature, world literature, music, history, geography, medicine, social work, transportation, architecture, communication, law, economics, management, business, education, the performing arts, and movies.

The Electronic Age (from 1985)

In the field of natural language processing, a nine-year project called the EDR (Electronic Dictionary Research) (1986–1994) was launched. It aimed to produce dictionaries for human language technology. The EDR electronic dictionary is a machine-tractable dictionary that catalogues the lexical knowledge of Japanese and English (a word dictionary, a bilingual dictionary, and a co-occurrence dictionary), and has unified thesaurus-like concept classifications (a concept dictionary) with corpus databases (the EDR corpus). It is now widely available for research and commercial purposes.

As computer technology advanced in the late 20th century, Japanese lexicography gradually moved into a new age of electronic publishing. The first CD-ROM dictionary was *Saishin kagaku yogo jiten* (最新科学用語辞典, *A new dictionary of scientific terms*, Sanshusha) in 1985. In 1987, Iwanami Press published the CD-ROM version of *Kojien*, the most popular monolingual dictionary in Japan, which triggered a rapid growth of the electronic dictionary market. In 1991, Fujitsu, Sony, Dai Nippon Printing Co. Ltd, and Iwanami Press, all involved in the production of *Kojien*, founded the EPWING Consortium, and most publishers involved in electronic dictionary publishing joined it. Until the Internet and Web technology began to flourish, this EPWING Consortium facilitated the appearance of various types of electronic dictionaries on the market. Sony's *Denshi book* (Electronic Book DD–25) became very popular because it contained several dictionaries from different publishers on the same diskette. More recently, websites such as Yahoo and Infoseek have begun to provide free Web dictionary services, in which major unabridged monolingual dictionaries such as *Dai jirin* (大辞林 233 000 entries) and *Dai jisen* (大辞泉 220 000 entries) can be accessed via the Web. Also, pocket electronic dictionaries

produced by Casio, Seiko, Sharp, and Sony all contain several Japanese monolingual as well as Chinese character dictionaries. The electronic dictionary market is rapidly growing in Japan, and the market share will soon exceed that of paper dictionaries. The most popular type of these electronic dictionaries is the all-in-one type, which contains more than 30 different titles, including all types of Japanese dictionaries (monolingual, Chinese character, thesaurus, old Japanese, idioms, proverbs, and loan words), different English dictionaries (monolingual, Japanese–English, English–Japanese), encyclopedias, and some specialized dictionaries such as dictionaries of medicine and new words.

Jargon

K Allan, Monash University, Victoria, Australia

The word *jargon* probably derives from the same source as *gargle*, namely Indo-European **garg*- meaning throat, and it originally referred to any noise made in the throat. In Middle English it was generally used to describe the chattering of birds, or human speech that sounded as meaningless as the chattering of birds. It was used (contemptuously) to refer to trade languages such as *Chinook Jargon* (q.v.). Jane Austen used *jargon* in the sense 'cliché' (*Sense and sensibility*, Ch.18). Today,

> Jargon is the language peculiar to a trade, profession, or other group; the language used in a body of spoken or written texts dealing with a circumscribed domain in which speakers share a common specialized vocabulary, habits of word usage, and forms of expression.

This definition includes what some scholars call 'specialist' or 'technical' language, 'restricted' language (Firth, 1968: 98), 'sublanguage' (Kittredge and Lehrberger, 1982), and others 'register' (e.g., Zwicky and Zwicky, 1982; Wardhaugh, 1986).

Jargons differ from one another grammatically and sometimes phonologically or typographically, as can be seen by comparing a statement of some of the requirements on the cricket field with the two-line excerpt from a knitting pattern, then the wedding invitation that follows it, and all of these with the excerpt from a Wordsworth poem and a text message version of that (such as might be conveyed using the SMS facility on a mobile phone).

> A fast-medium right arm inswing bowler needs two or three slips, a deep third man, a gully, a deepish mid-off, a man at deep fine leg and another at wide mid-on.

Earth has not anything to shew more fair:	erth nt a thng so brill
Dull would he be of soul who could pass by	hes dul v soul pssng by
A sight so touching in its majesty.	sght of mjstic tch.
(Wordsworth *Upon Westminster Bridge*)	(Peter Finch *N Wst Brdg*, a text message version of the Wordsworth lines from http:// .guardian.co./uk//// |0,12241,785819,00.html in September2002)

A jargon is identified by one or more of the following criteria.

i. **Lexical markers.**
   a. Vocabulary specialized for use in some particular domain (the subject matter of a jargon). The lexical relations among specialized vocabulary will reflect the accepted taxonomies within the domain (e.g., forms, varieties, species, genera, families, orders, classes in biology).
   b. Idioms and abbreviations (e.g., in telecommunications, *DNA* 'does not answer', *MBC* 'major business customer', *HC&F* 'heat coil and fuse', *LIBFA* 'line bearer fault analysis'; in linguistics, *Noun Phrase* and NP; in logic, *if and only if* and *iff*; in biology, ♂ and ♀).

ii. **Syntactic markers** such as
   a. imperatives in recipes and knitting patterns;
   b. large numbers of impersonal passives in reports of scientific experiments (e.g., *It was observed that . . .*);
   c. full noun phrases in place of pronouns in legal documents (e.g., *A term of a sale shall not be taken to exclude, restrict, or modify the application of this Part unless the term* [not 'it'] *does so expressly or is inconsistent with that provision*).

iii. **Presentational markers.**
   a. Prosodic (voice quality, amplitude, rhythm, etc.) and paralinguistic and/or kinesic (gaze, gesture, etc.) characteristics within a spoken medium, typographical conventions within a written medium; e.g., a hushed tone and minimal kinesic display is more frequently expected in funeralese than in football commentary or anecdote; in mathematics, {a,b}, <a,b>, and (a,b) will normally have different and conventionally prescribed interpretations; in linguistics, language expressions that are mentioned rather than used are usually italicized.
   b. Format in which a text is presented; this is particularly evident in the written medium, as can be seen from the preceding four examples.

Jargon has two functions:

1. to serve as a technical or specialist language;
2. to promote in-group solidarity, and to exclude as out-groupers those people who do not use the jargon.

To the initiated, jargon is efficient, economical, and even crucial in that it can capture distinctions not made in the ordinary language. Linguists, for instance, redefine everyday terms such as *sentence, word, syllable,* and *grammar* and add a number of new terms to overcome imprecision and to distinguish things that nonlinguists ignore and, in consequence, ordinary language lacks terms for. They distinguish between *grammatical, orthographic*, and *phonological words* as well as introducing terms such as *lex, lexeme, morph,* and *morpheme* to capture additional distinctions.

Jargons, like bureaucratese (the language of government and corporate offices), have two motivations. One, shared with criminal jargon and slang, is the exclusion of out-groupers. The second motivation is to augment the bureaucrat's self-image by using a Graeco-Latinate lexicon, which (to the outsider, at least) obfuscates the commonplace (and often trivial) and endows it with gravity; this achieves a double-whammy by also mystifying and intimidating the clientele. We rarely uncover such blatant lexical substitution as

> [*Emendation to the traffic plan for a London borough*] Line 5. Delete 'Bottlenecks', insert 'Localised Capacity Deficiencies'. (Quoted in Cutts and Maher, 1984: 45)

No wonder Charles Dickens referred to Whitehall as the Circumlocution Office.

Because it is founded on a common interest, the most remarkable characteristic of a jargon is its specialized vocabulary and idiom. Although jargons facilitate communication among in-groupers on the one hand, on the other they erect communication barriers to keep out-groupers out. It is, of course, out-groupers who find jargon 'abounding in uncommon or unfamiliar words,' and therefore "unintelligible or meaningless talk or writing; gibberish" (*Macquarie Dictionary,* 1991). If the out-grouper is sufficiently rancorous she or he might also conclude the jargon is 'debased, outlandish or barbarous.' For some jargons such as legalese or linguisticalese, the in-group is fairly well defined. For others, such as stock market reports and games such as bridge, football, and cricket, there is barely an in-group at all except

among professionals. For language dealing with death (outside the funeralese of the bereavement industry), birth notices, and recipes, there is even less of an in-group – though there is a special vocabulary and there are conventional patterns of expression for all of these. The facts are clear: where in-groupers are associated with a particular trade or profession, they constitute a well-defined group; they are somewhat less well defined by a common recreational interest; and the most ill-defined in-groups are those defined merely by a temporary interest in the topic of the jargon – such as those members of the public who publish birth notices.

It follows that every text/discourse, including social chitchat, is jargon of one kind or another and that everybody uses at least one jargon. In fact, almost everybody controls several jargons and often many. It is often the case that an expert in one domain (an in-grouper with respect to its jargon) needs to explain something within the domain to a novice outside the domain (an out-grouper) with minimal use of jargon. An example would be where a lawyer needs to explain some point of law to a client, or a doctor needs to explain a medical condition to a patient, and educationists most all of the time. Any jargon is in constant contact with others, and it should be fairly obvious that jargons are not discrete from one another: all of them borrow from language that is common to other jargons. The following is an excerpt from a chatroom interchange replete with chatroom jargon such as *lol* (the acronym from "laughing out loud," which is used here more like a grin in *f2f* 'face to face' conversation as a mark of empathy), *j/k* 'just kidding', and emoticon smiles :), :-) and wicked smile >:); there is also jargon appropriate to in-group discussion of computer hardware, but note the divergence into less esoteric matters than disk drives and controllers. This mixing of jargons is very common in regular conversational discourse.

<Darkman-X> so wait becuz i have the onboard raid controller i could fit 2 hdd's on the raid controllers and 2 on the ide controllers?

<mark> RAID is just a standard of combining different drives.. you can make a raid out of scsi drives along side ide drives if you want

<mark> you could make a raid out of a hard drive and a ram drive

<mark> just forget about the raid stuff

<Darkman-X> lol

<mark> and picture it as another ide controller

<mark> thats all it is unles syou setup the raid stuff

<Darkman-X> so wait i can have 2 hdd's on the raid, 2 on teh primary ide and then 2 drives on the secondary ide?

<mark> i guess.. tried reading the manual?

<Darkman-X> lol manual?

<mark> :)

<mark> didnt your motherboard come with any papers

<Darkman-X> iz that that book that says A7V333 on it?

<[RaW]> yes

<Darkman-X> lol the one that i'm using to prop up my comp table?

<[RaW]> probably

<Darkman-X> whoops

<Darkman-X> :-)

<Darkman-X> j/k

<JoHn> lol

<[RaW]> yur supposed to use your school books for that dummy

<Darkman-X> ummm no i dun wanna look at em

<Darkman-X> they're evil

<[RaW]> keep your motherboard manual close to your heart

<[RaW]> >:)

<Darkman-X> lol

(*Sic*. Logged August 29, 2002)

A jargon cannot be precisely defined because the boundaries of any one particular jargon are impossible to draw nonarbitrarily.

It is impossible to taboo jargon. Jargon cannot be translated into 'ordinary English' (or whatever language) because there is no such thing. Changing the jargon alters the message: a speaker simply cannot exchange *faeces* for *shit* or *terrorist* for *freedom-fighter* or even *bottlenecks* for *localised capacity deficiencies* without changing the connotations of the message the person intends to convey. There is no convenient substitute for some jargon: to replace legalese *defendant* with *a person against whom civil proceedings are brought* is communicatively inefficient. It would be inappropriate for a lawyer not to use jargon when creating a legal document: that is exactly what legalese is for. Legal language is difficult because laws are complex and not because lawyers try to obfuscate. Similar remarks apply to other well-motivated uses of jargon.

Jarring, Gunnar (1907–2002)

B Sigurd, Lund, Sweden

Gunnar Valfrid Jarring, Turkologist and diplomat, was born on October 12, 1907 and died on May 28, 2002. He studied German and Scandinavian languages at Lund University, but it was during his comparative Indo-European studies with Herbert Pettersson and Slavic studies with Sigurd Agrell that he became interested in the Turkish languages. Turkish, in particular East Turkish, was represented by Gustaf Raquette, docent at Lund since 1924. Raquette and his missionary colleagues at Kashgar in East Turkestan (currently Xinjiang) were willing to receive Jarring, and he traveled by train and on horseback via Moscow over Pamir to Kashgar. There he started to collect linguistic data and manuscripts, which formed the basis of his later work. The collection was stored at the Lund University library. Unfortunately, Jarring contracted Typhus fever, which decreased his working capacity in Kashgar.

The missionary station in Kashgar (closed in 1938 for political reasons) had its own printing works, and Jarring published a catalogue of all the works published in *Prints from Kashgar* (1991). The missionaries suggested orthographic rules and norms that were important for the development of East Turkish. Jarring has described his journeys to and stay at Kashgar in the popular book *Åter till Kashgar* (1979; English version, 1986).

Jarring spent some months in Berlin during 1928 and participated in the Turkology seminar there headed by the famous Turkologist Willy Bang. The discussions convinced Jarring of the importance of raw concrete data and of living languages, which he always focused on in his works rather than on theoretical discussions. Jarring became a well-established Turkologist with colleagues and friends in many countries, which was important to him even in his diplomatic service.

After returning to Sweden, Jarring completed his thesis *Studien zu einer osttürkischen Lautlehre*, which he defended at Lund in 1933. The book is an impressive survey with evaluations of earlier works, including phonology and grammar. Jarring was aware of the shortcomings of earlier transcription systems and was a pioneer in using the new phonetic alphabet APA, a predecessor of the International Phonetic Alphabet (IPA). The thesis also includes some illustrative texts with translations and comments. He became docent in Turkology at Lund the same year (and honorary professor in 1986).

Jarring focused on field data and folkloristic texts, as illustrated by *Materials to the knowledge of Eastern Turki: tales, poetry, proverbs, riddles,*

Jarring, Gunnar (1907–2002)

B Sigurd, Lund, Sweden

Gunnar Valfrid Jarring, Turkologist and diplomat, was born on October 12, 1907 and died on May 28, 2002. He studied German and Scandinavian languages at Lund University, but it was during his comparative Indo-European studies with Herbert Pettersson and Slavic studies with Sigurd Agrell that he became interested in the Turkish languages. Turkish, in particular East Turkish, was represented by Gustaf Raquette, docent at Lund since 1924. Raquette and his missionary colleagues at Kashgar in East Turkestan (currently Xinjiang) were willing to receive Jarring, and he traveled by train and on horseback via Moscow over Pamir to Kashgar. There he started to collect linguistic data and manuscripts, which formed the basis of his later work. The collection was stored at the Lund University library. Unfortunately, Jarring contracted Typhus fever, which decreased his working capacity in Kashgar.

The missionary station in Kashgar (closed in 1938 for political reasons) had its own printing works, and Jarring published a catalogue of all the works published in *Prints from Kashgar* (1991). The missionaries suggested orthographic rules and norms that were important for the development of East Turkish. Jarring has described his journeys to and stay at Kashgar in the popular book *Åter till Kashgar* (1979; English version, 1986).

Jarring spent some months in Berlin during 1928 and participated in the Turkology seminar there headed by the famous Turkologist Willy Bang. The discussions convinced Jarring of the importance of raw concrete data and of living languages, which he always focused on in his works rather than on theoretical discussions. Jarring became a well-established Turkologist with colleagues and friends in many countries, which was important to him even in his diplomatic service.

After returning to Sweden, Jarring completed his thesis *Studien zu einer osttürkischen Lautlehre*, which he defended at Lund in 1933. The book is an impressive survey with evaluations of earlier works, including phonology and grammar. Jarring was aware of the shortcomings of earlier transcription systems and was a pioneer in using the new phonetic alphabet APA, a predecessor of the International Phonetic Alphabet (IPA). The thesis also includes some illustrative texts with translations and comments. He became docent in Turkology at Lund the same year (and honorary professor in 1986).

Jarring focused on field data and folkloristic texts, as illustrated by *Materials to the knowledge of Eastern Turki: tales, poetry, proverbs, riddles,*

ethnological and historical texts from the southern parts of Eastern Turkestan (1946–1991) and *The Moen collection of Eastern Turki (New Uighur) popular poetry* (1996). He treated the demographic situation in *On the distribution of Turk tribes in Afghanistan: an attempt at a preliminary classification* (1939). As an example of his religious observations one may mention *Culture clash in central Asia: Islamic views on Chinese theatre: Eastern Turki texts* (1991). During his stay as ambassador in Moscow from 1964 to1973, Jarring became interested in the history of Swedish–Russian relations, including the interesting destinies of the prisoners from the wars of Charles XII (the Caroleans). Jarring also examined the place-names noted by his famous compatriot Sven Hedin and published *Central Asian Turkic place-names: Lop Nor and Tarim area: an attempt at classification and explanation based on Sven Hedin's diaries* (1997).

Jarring became engaged in Swedish diplomatic service in 1941 and served in Teheran, New Delhi, Washington, and Moscow. He was the Swedish representative in the United Nations (UN) security council in 1957–1958. He was the UN secretary's special representative for the Middle East in 1967–1990 and served as mediator in the Kashmir conflict and in the conflict after the Six-Day War between Egypt and Israel. His name was also suggested for the post of secretary of the United Nations. He has reported about his life and experience in several books, e.g., *Memoarer 1939–1952* (1981).

As an international diplomat Jarring was known as 'The Clam,' and it was said about him that 'few could keep silent in as many languages as he.' In spite of his many important diplomatic tasks he managed to work continually in his special linguistic and ethnographic fields. His list of publications includes over 1000 items. He continued to extend his *Eastern Turki-English Dialect Dictionary* (1964), which in 1998 existed in a handwritten form (about 2000 pages) three times longer than the original version, but he was not able to complete its publication before his death in 2002.

Approximant	*w*		*r, l*	*y*		

divided into seven subdialects (Nothofer, 1980). The central and eastern dialect variants have not yet been studied in much detail.

Standard Javanese is the language as it is spoken in the area of Surakarta and Yogyakarta. Javanese has speech levels that are based on the principle to whom and about whom one talks. The level chosen depends on factors such as age, status, and respect. The degree of politeness is expressed by lexical or affixal choices. The speech levels are a Javanese innovation. Clynes (1992) argues that this system was well established by the 15th century. Sundanese (Sunda), Madurese (Madura), Balinese (Bali), and Sasak (but not Malay) have borrowed these speech levels. The position of Javanese in the Western Malayo-Polynesian subfamily has been a matter of dispute. While Dyen (1965) and Nothofer (1975) grouped Javanese with Malay, Sundanese, and Madurese, Nothofer (1985) suggests that the latter three – although not necessarily constituting a subgroup – are more closely related to each other than they are to Javanese. Javanese is one of the few Austronesian languages whose history can be traced because of the existence of older texts. The oldest records date back to the 8th century. Zoetmulder (1974) deals with Old Javanese literature and Zoetmulder (1982) is an Old Javanese-English dictionary.

Javanese Phonology

Consonants

The Javanese consonant system resembles that of other languages of western Indonesia. There are features that are common to Javanese and Madurese only. Both languages share a phonemic distinction between dental and retroflex stops. The 'voiced' consonants of Javanese are pronounced like voiceless stops with breathy voice of the following vowel (Fagan, 1988; Arps *et al.*, 2000). The consonants are shown in Table 1.

Vowels

Nothofer (1980) suggests a system of six vowel phonemes, shown in Table 2.

Javanese has the following allophonic rules (Clynes, 1995; Nothofer, 1980): /*i*/, /*u*/ are realized as [*I*], [*ʊ*] in closed syllables and as [*i*], [*u*] elsewhere. /*ə*/ is always realized as [ə]. The phonemes /*e*/, /*o*/ are realized as [*ɛ*] and [*ɔ*] in closed syllables, in open syllables where the vowel in a following open syllable is high, and in open syllables where the vowel in a following syllable is identical or /*ə*/. In all other positions, these phonemes are realized as [*e*] and [*o*]. The phoneme /a/ appears as [*ɔ*] word-finally and in penultimate open syllables where a following open syllable has /a/. Otherwise, it appears as [*a*]. Allophonic variation also depends on the initial phoneme of suffixes: the addition of a consonant-initial suffix results in the treatment of the stem-final vowel as if it appeared in a closed syllable and the addition of a vowel-initial suffix will cause a high vowel in the stem-final closed syllable to behave as if it appeared in an open syllable.

Morphology

Verbal affixes include the following: *N-* indicates an 'active' and *di-* a 'passive' transitive verb, *kə-* marks 'accidental passive.' *-ke* forms transitive verbs whose patient is the causee or benefactee, while *-i* forms transitive verbs in which the undergoer is the location or goal of the action. Intransitive verbs with *-an* indicate 'nonchalance, to be in the state of, to busy o.s. with.' The suffix *-a* with the sense 'in case, assuming, although' occurs with nonverbs (e.g., pronouns, adjectives) and verbs. Arps *et al.* (2000) call it the 'irreality-suffix.' It is distinguished from the verbal suffix *-a,* which is an imperative marker. The suffix *-ən* is added to nouns denoting physiological conditions and forms verbs meaning 'undergo the physiological process of (the noun).' The nominal affixes include *-an,* which derives nouns that stand as objects of an action indicated by the verb; *kə- -an*, used to nominalize qualities; nouns formed with *pəN-* refer to a person carrying out the action of the verb or an instrument with which the action is performed; and *pə-an* nouns refer to a process or result of an action indicated by the verb or to the location where an action of the corresponding verb occurs.

The meaning of total reduplication of nouns is 'diversity, completeness,' while that of verbs has

Table 2 Javanese vowel phonemes

Vowel type	*Front*	*Central*	*Back*
High	*i*		*u*
Mid	*e*	*ə*	*o*
Low		*a*	

the sense of 'durative, intensive, iterative.' Verbal reduplication can also involve vowel variation in the first member of the doubled form.

Writing System

After the World War II, the publication of texts in Javanese script (hanacaraka or caraka) came to an end. Actually, the Latin script began to replace the Javanese alphabet at the beginning of the 20th century. The traditional script originates from a Pallava script of southern India.

Jèrriais

M C Jones, University of Cambridge, Cambridge, UK

Background

Jèrriais is the dialect spoken on Jersey, the largest of the Channel Islands. It is related to the Norman dialects of northern France. (For details of Jersey's linguistic history, including its Anglicization and the decline in speaker numbers, *see* **Channel Islands: Language Situation**.)

According to the 2001 Census of Jersey, there then remained only 2874 speakers of Jèrriais, (3.2% of the total resident population). Some two-thirds of these were over age 60 and only 113 speakers declared Jèrriais to be their usual everyday language.

Phonological Structure

Although the phonological structure of Jèrriais is similar to that of standard French, there are also significant differences. Marked regional variation is still very much in evidence in modern Jèrriais, with

Table 2 Javanese vowel phonemes

Vowel type	*Front*	*Central*	*Back*
High	*i*		*u*
Mid	*e*	*ə*	*o*
Low		*a*	

the sense of 'durative, intensive, iterative.' Verbal reduplication can also involve vowel variation in the first member of the doubled form.

Writing System

After the World War II, the publication of texts in Javanese script (hanacaraka or caraka) came to an end. Actually, the Latin script began to replace the Javanese alphabet at the beginning of the 20th century. The traditional script originates from a Pallava script of southern India.

Jèrriais

M C Jones, University of Cambridge, Cambridge, UK

Background

Jèrriais is the dialect spoken on Jersey, the largest of the Channel Islands. It is related to the Norman dialects of northern France. (For details of Jersey's linguistic history, including its Anglicization and the decline in speaker numbers, *see* **Channel Islands: Language Situation**.)

According to the 2001 Census of Jersey, there then remained only 2874 speakers of Jèrriais, (3.2% of the total resident population). Some two-thirds of these were over age 60 and only 113 speakers declared Jèrriais to be their usual everyday language.

Phonological Structure

Although the phonological structure of Jèrriais is similar to that of standard French, there are also significant differences. Marked regional variation is still very much in evidence in modern Jèrriais, with

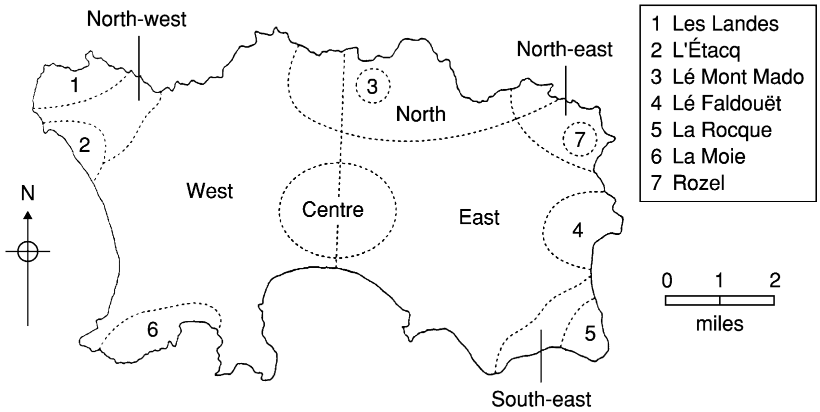

Figure 1 Jersey's 'linguistic pockets.' Reproduced with permission from Jones M C (2001). *Jersey Norman French: a linguistic study of an obsolescent dialect*. Oxford: Blackwell.

the sub-varieties usually categorized in two main groups: East and West Jèrriais (see Figure 1). Even more localized variation is readily observable, although with the decline in speaker-numbers, these so-called linguistic pockets are fast disappearing. This internal variation has never been based on any administrative or other territorial boundaries within Jersey, but many of the Islanders feel it to be intrinsically linked with parish boundaries (see Figure 2), and the practice of using the name of parishes to refer to the sub-dialects of Jèrriais is well established, although not strictly correct. Unless stated, the following comments relate to most varieties of Jèrriais.

Vowels:
Oral: /i e ɛ y œ a u o ə/; the French vowels /ø/ and /ɔ/ are lacking
Nasal: /ẽ ɛ̃ ø̃ õ ɑ̃/;

Unlike in standard French, vowel length is phonemic and all vowels, except /ə/, can be either short or long. Long /a/ is usually realized phonetically as [ɑ]. Jèrriais therefore has 27 vowel phonemes (17 oral, 10 nasal) compared to the 16 of standard French.

Consonants:
Stop: /p b t d k g/
Fricative: /f v s z ð ʃ ʒ h/
Affricate: /tʃ dʒ/
Nasal: /m n ɲ/
Lateral: /l/
Trilled: /r/; this corresponds to the uvular *r* of standard French

/ð/ (written *th*) occurs mainly as a result of the assibilation of intervocalic /r/ in western Jersey and some northern parts of Trinité and St. Martin e.g., *dithe* 'to say' (Fr. *dire*). In St. Ouen, /ð/ also occurs as a development of intervocalic /z/, e.g., *maîson* /meðõ/ 'house' (/me(j)zõ/ elsewhere).

In standard French, the affricates /tʃ/ and /dʒ/ only occur in borrowings, e.g., *match*, *gin*. However, in Jèrriais they can occur as the result of the secondary palatalization of /k/ and /g/, e.g., *tchoeu* /tʃœ/ 'heart', *dgèrre* /dʒɛ:r/ 'war' (Fr. *coeur*, *guerre*) and of /t/ and /d/, e.g., *mêtchi* /metʃi/ 'profession', *dgix* /dʃi/ 'ten' (Fr. *métier*, *dix*).

Like standard French, Jèrriais preserves no trace of Latin /h/. /h/ was introduced into the French phonemic system in words borrowed from the language of the Germanic invaders who dominated northern Gaul in the 5th to the 8th century. The sound disappeared from standard French in the early modern period (16th–18th century) but remains in Jèrriais, e.g., *housse* /hus/ 'holly' (Fr. *houx*).

In many parts of Jersey, when /l/ is the second element of a consonant cluster, it frequently undergoes delateralization to /j/, e.g., *clios* /kjo/ 'field' (Fr. *clos*). In St. Ouen, however, the more conservative form /kʎo/ is still to be heard amongst older speakers. St. Ouen also retains the /ʎ/ pronunciation word-finally in words such as /fiʎ/ *fil'ye* ('daughter') whereas, elsewhere in Jersey, /ʎ/ has become depalatalized to /l/.

The velar nasal /ŋ/ occurs in standard French only in borrowings, e.g., *le shopping* /ʃɔpɪŋ/. Despite its restricted distribution, it is generally given phonemic status. The sound also occurs in Jèrriais in English borrowings such as *blanket*, *dinghy* /blæŋkɛt/, /dɪŋi/. However in Jèrriais /ŋ/ is not considered to be phonemic.

Glides The three glides of standard French (/j ɥ w/) also occur in Jèrriais but there is a tendency for /ɥ/ to be replaced by /w/.

Vocabulary

Most of the vocabulary of Jèrriais is shared with standard French, but regional variation is also

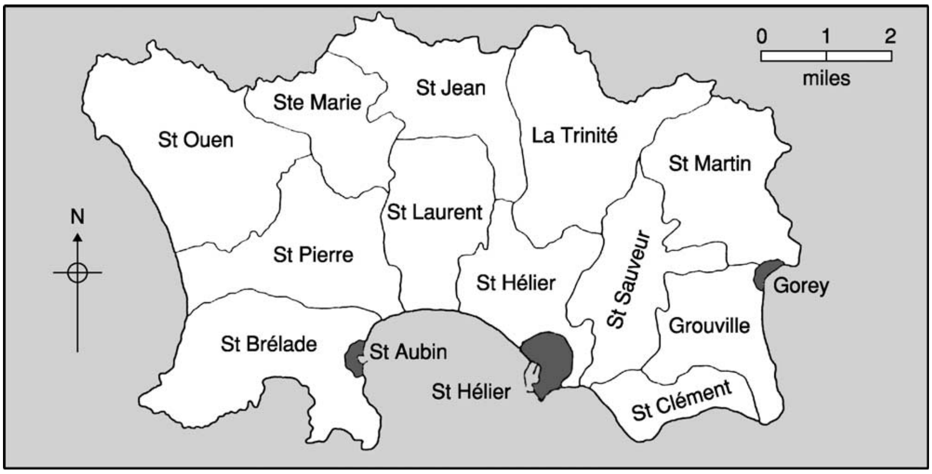

Figure 2 The twelve parishes of Jersey. Reproduced with permission from Jones M C (2001). *Jersey Norman French: a linguistic study of an obsolescent dialect.* Oxford: Blackwell.

apparent in the lexis of Jèrriais, e.g., *pêtre* 'spider' (WJ), *ithangnie* (EJ). The dominant influence of English has had far-reaching linguistic consequences, most noticeably in the lexis, where borrowings abound in many everyday domains. Some of these are well established, e.g., *bouchet* 'bucket', *ticl'ye* '(tea)kettle' while others are more recent, e.g., *software*. The semantic adaptation of Jèrriais words on the basis of their English equivalents is also found, e.g., *J'n'sais pon comment chenna* ***travaille*** 'I don't know how that **works**', as are calques of English phrasal verbs and other expressions, e.g., *i'tchit bas* 'he fell down'; *j'chèrchis pouor* 'I looked for it'.

Morphosyntax

The more striking morphosyntactic differences between Jèrriais and standard French include:

i. the Old French distinction of number in masculine nouns and adjectives between *–el* (s.), *-eaus* (pl.), e.g., *chastel* 'castle', pl. *chasteaus*; *novel* 'new', pl. *noveaus* 'new', has been lost in standard French as a result of the creation of a new analogical singular based on the plural, e.g., *château* ~ *châteaux* (both pronounced [ʃato]), *nouveau* ~ *nouveaux*, though the original singular remains before vowels, e.g., *le nouvel an* 'New Year'; in Jèrriais, the distinction is maintained, *châté* ~ *châtchieaux*, *nouvé* ~ *nouvieaux*;
ii. the first person plural personal pronoun subject *nous* is replaced by *jé/j'*, e.g., *j'pâlons* (Fr. *nous parlons*) 'we speak';
iii. there is no specific feminine third person plural subject personal pronoun, *i'* serving for both genders (cf. Fr. *ils* masc., *elles* fem.);
iv. adjectives of color almost invariably precede the noun, e.g., *lé nièr cat* 'the black cat' (Fr. *le chat noir*);
v. the preterite tense, which has gone out of use in informal spoken French, though it survives in the formal written language, is widely used in spoken and written Jèrriais, e.g., *j'donnis* 'I gave'. Certain third person plural preterite forms are restricted to St. Ouen, e.g., *i'vidrent* 'they saw', *i'fûdrent* 'they went' (for *i'vîtent*, *i'fûtent* elsewhere)
vi. the imperfect subjunctive, now virtually defunct in spoken French, also survives, e.g., *j'voulais qu'i'l'sûsse* 'I wanted him to know'.

The dominance of English on Jersey is also leading to an increase in frequency of syntactic constructions more isomorphic with English.

Language Planning

Since being introduced into the education system in 1999, Jèrriais is now offered on an extra-curricular basis in most of the Island's schools. It also features in a couple of weekly radio slots and in a fortnightly newspaper column. However, Jèrriais enjoys no more than a token presence on television. Language planning measures receive very little official backing, and with the exception of the Jèrriais education initiative, which has received funding from the States of Jersey, have been left in the hands of groups of enthusiasts.

Jèrriais has been codified via a dictionary (Le Maistre, 1966) and grammar (Birt, 1985). The standard variety is based largely on the sub-dialect of St. Ouen.

Literary Tradition

Although the important 12th-century writer Wace (c. 1100–1179) is known to have come from Jersey,

no literary writings in Jèrriais exist until the 19th century. The first author to use the dialect as a medium for his work was Matthieu Le Geyt (1777–1849). Jersey produced several poets and writers during the course of the 19th and 20th centuries; much of their output was published in newspapers and periodicals. Although collections of satirical short stories in Jèrriais were published in pamphlet form from the third quarter of the 19th century onward, the first complete volume of prose to be published in Jèrriais was George Le Feuvre's *Jèrri jadis* (1973).

Jespersen, Otto (1860–1943)

M Pierce, University of Michigan, Ann Arbor, MI, USA

Otto Jespersen was born on July 16, 1860, in Randers, Denmark. In 1870 his father died, and 4 years later, his mother died as well. Although Jespersen had been very interested in languages as a child and had studied a number of them on his own (including Italian, Spanish, Greek, and Old Norse), following family tradition, he originally studied law at the University of Copenhagen, where he enrolled in 1877. After 4 apparently unhappy years of studying law, during which time he partially supported himself by working as a shorthand reporter in the Danish Parliament, he switched fields to Romance languages. In 1887 he was awarded a master's degree in French and spent the next year abroad, in England, France, and Germany, improving his knowledge of the local languages, establishing contacts with various scholars, and studying phonetics and Old and Middle English. On his return to Denmark, Jespersen began teaching French and English at various schools. In 1891 he was awarded a doctorate from the University of Copenhagen for a dissertation about the case system of English. He continued school teaching until 1893, when he became professor of English at the University of Copenhagen, where he would remain (excluding visiting positions) for the remainder of his career. Jespersen served as visiting professor at Columbia University and the University of California at Berkeley in 1909–1910 and as rector of the University of Copenhagen in 1920–1921. He retired from the University of Copenhagen in 1925 but continued to publish at a prodigious rate until his death in 1943.

Jespersen was the recipient of numerous scholarly honors, receiving honorary doctorates from Columbia University (1910), St. Andrews University (1925), and the Sorbonne (1927). He was invited to lecture at the Congress of Arts and Sciences, held in conjunction with the World Fair, in St. Louis in 1904. He was elected to the Danish Videnskabernes Skelskab in 1899 and served as president of the Fourth International Congress of Linguists, held in Copenhagen in 1936. He had a wide circle of students, friends, and admirers, as evidenced by the two separate volumes of papers dedicated to him.

Jespersen was an exceptionally productive scholar who contributed to a number of fields within linguistics. He is perhaps best known for his work on English, phonetics, general linguistics, language pedagogy, and historical linguistics. His most important contribution to English linguistics is certainly his monumental *Modern English grammar on historical principles* (published in seven parts, 1909–1949). Although the organization of the work may seem random at first glance, as volume 1 deals with the history of English phonology, volumes 2–5 with syntax, and volume 6 with morphology, and then volume 7 returns to syntax, it is one of the truly great books of linguistics and a fitting culmination of a life's work on linguistics and the English language. Jespersen also wrote a number of shorter works on English linguistics, including his outstanding *Growth and structure of the English language* (Jespersen, 1938), which was used for many years in university classes and translated into Japanese. The quality of this work is perhaps best indicated by the fact that it won the Volney Prize from the French Institute (Juul *et al*., 1995: 137).

Jespersen was an outstanding phonetician. Although he seems to have originally become interested in phonetics because of its possible applications in language teaching, he quickly became fascinated with it in its own right. He published a general handbook of phonetics early in his scholarly career (Jespersen, 1897; the work was later translated into German, but unfortunately not into English) and even developed his own system of phonetic transcription. True to what originally piqued his interest, Jespersen did not neglect the role of phonetics in language pedagogy. For example, he prepared a textbook of French in which French words were given in phonetic transcription, with an eye toward improving students' pronunciation from the beginning of their studies.

Yet Jespersen was not limited in his research; he often worked on questions of general linguistics. Perhaps his best known book in this area was *Language, its nature, development, and origin* (Jespersen, 1922), which deals with topics like child language, causes of language change, and the history of linguistics. Jespersen was also deeply concerned with problems of language pedagogy. He prepared textbooks or readers for Danish, French, and English, as well as more general works on the subject. Finally, he also published extensively on historical linguistics, including a groundbreaking paper originally published in 1886, which contested the Neogrammarian dogma that sound laws were exceptionless, and also often treated historical questions in his more general works. His most important contribution to this field is probably his work on efficiency as a cause of language change (see especially Jespersen, 1941). Although it would be misguided to argue that Jespersen saw efficiency as the cause of all language change, he certainly contended that it played an important role. In addition, Jespersen worked on a number of

other subjects not discussed here, including international languages, English literature, and syntax (see Jespersen 1893, 1924, and 1928, among others).

Jewish Languages

B Spolsky, Bar-Ilan University, Ramat Gan, Israel
S B Benor, Hebrew Union College – Jewish Institute of Religion, Los Angeles, CA, USA

Introduction

Ethnic and religious groups use language as one means of constructing and expressing their distinctness from other groups. Jews are no exception. Wherever Jews have lived – from Baghdad to Brooklyn, Amsterdam to Odessa – they have spoken somewhat differently from their non-Jewish neighbors. These differences have been as small as the addition of a few Hebrew words and as large as a vastly different lexicon, syntax, and phonology. Therefore, the term "Jewish language" refers to any linguistic variety spoken by Jews that differs to some extent from the non-Jewish language(s) around it. The field of Jewish language studies examines the distinct linguistic practices of the Jewish people around the world.

Jewish languages generally exist in a situation of triglossia with the local non-Jewish language(s) and with a liturgical combination of Hebrew and Aramaic (Weinreich, 1980; Rabin, 1981; and Fishman, 1985). The Jewish language is used mostly for intra-community speech and sometimes for writing. Speakers also generally have at least some knowledge of the co-territorial non-Jewish languages and use them in their interactions with non-Jews. Hebrew and Aramaic have played a very important role in Jewish life. Biblical and rabbinic literatures are studied regularly in their original languages, and daily prayers are conducted mostly in Hebrew and Aramaic. Hebrew is also used for contemporary rabbinic and liturgical production, as well as some other literary functions.

Jewish languages have been documented in many parts of the Jewish diaspora: Yiddish (sometimes referred to as Judeo-German), Judeo-Spanish (also called Ladino, Judezmo, Dzhudezmo, Jidyó, Spanyol, Spanyolit), Judeo-Greek (Yevanic, Romaniyot), Judeo-Italian (Italkic, including local varieties like Judeo-Venetian), Judeo-Portuguese, Judeo-French (Zarphatic, Western Loez), and Judeo-Provençal (Shuadit) in Europe; Judeo-Arabic (Yahudic), Judeo-Aramaic (Targum, Kurdit), Judeo-Persian (Jidi, Parsic, Judeo-Tadjik, Judeo-Tat, Bukharan), Judeo-Georgian (Gurjuc, Gruzinic), Judeo-Crimean Tatar (Krimchak), and Judeo-Berber in the Middle East, North Africa, and the former Soviet Union; Judeo-Malayalam in India; and Jewish English (Yinglish, Yeshivish) in the New World. Some of the larger and better-studied cases are described in separate sections below.

Scholarship

The scholarly recognition of a phenomenon of Jewish languages goes back to the beginning of the 20th century, when Yiddish became the object of serious academic study. Mieses (1915) presented the first large-scale exploration of Jewish linguistic varieties. In late 1970s and early 1980s, Jewish languages

other subjects not discussed here, including international languages, English literature, and syntax (see Jespersen 1893, 1924, and 1928, among others).

Jewish Languages

B Spolsky, Bar-Ilan University, Ramat Gan, Israel
S B Benor, Hebrew Union College – Jewish Institute of Religion, Los Angeles, CA, USA

Introduction

Ethnic and religious groups use language as one means of constructing and expressing their distinctness from other groups. Jews are no exception. Wherever Jews have lived – from Baghdad to Brooklyn, Amsterdam to Odessa – they have spoken somewhat differently from their non-Jewish neighbors. These differences have been as small as the addition of a few Hebrew words and as large as a vastly different lexicon, syntax, and phonology. Therefore, the term "Jewish language" refers to any linguistic variety spoken by Jews that differs to some extent from the non-Jewish language(s) around it. The field of Jewish language studies examines the distinct linguistic practices of the Jewish people around the world.

Jewish languages generally exist in a situation of triglossia with the local non-Jewish language(s) and with a liturgical combination of Hebrew and Aramaic (Weinreich, 1980; Rabin, 1981; and Fishman, 1985). The Jewish language is used mostly for intra-community speech and sometimes for writing. Speakers also generally have at least some knowledge of the co-territorial non-Jewish languages and use them in their interactions with non-Jews. Hebrew and Aramaic have played a very important role in Jewish life. Biblical and rabbinic literatures are studied regularly in their original languages, and daily prayers are conducted mostly in Hebrew and Aramaic. Hebrew is also used for contemporary rabbinic and liturgical production, as well as some other literary functions.

Jewish languages have been documented in many parts of the Jewish diaspora: Yiddish (sometimes referred to as Judeo-German), Judeo-Spanish (also called Ladino, Judezmo, Dzhudezmo, Jidyó, Spanyol, Spanyolit), Judeo-Greek (Yevanic, Romaniyot), Judeo-Italian (Italkic, including local varieties like Judeo-Venetian), Judeo-Portuguese, Judeo-French (Zarphatic, Western Loez), and Judeo-Provençal (Shuadit) in Europe; Judeo-Arabic (Yahudic), Judeo-Aramaic (Targum, Kurdit), Judeo-Persian (Jidi, Parsic, Judeo-Tadjik, Judeo-Tat, Bukharan), Judeo-Georgian (Gurjuc, Gruzinic), Judeo-Crimean Tatar (Krimchak), and Judeo-Berber in the Middle East, North Africa, and the former Soviet Union; Judeo-Malayalam in India; and Jewish English (Yinglish, Yeshivish) in the New World. Some of the larger and better-studied cases are described in separate sections below.

Scholarship

The scholarly recognition of a phenomenon of Jewish languages goes back to the beginning of the 20th century, when Yiddish became the object of serious academic study. Mieses (1915) presented the first large-scale exploration of Jewish linguistic varieties. In late 1970s and early 1980s, Jewish languages

started to be studied intensively, following the publication of two major studies of Yiddish that discussed them in a historical context (Birnbaum, 1979; Weinreich, 1980). Around this time, scholars in Israel and the United States edited symposia (Rabin *et al.*, 1979), collections of articles (Paper, 1978; Fishman, 1985; Gold, 1989) and a short-lived journal (Gold and Prager, 1981–1987). More recently, there has been a wave of renewed interest in the subject, as evidenced by the Jewish Language Research Website (www.jewish-languages.org) and the Jewish Languages Mailing List (www.jewish-languages. org/ml).

History

The presumed monolingualism of the early kingdoms of Israel and Judah gave way, in the centuries after the Babylonian exile in the 6th century B.C., to a Hebrew-Aramaic bilingualism (Chomsky, 1957). By the end of the Temple period 2000 years ago, these languages were supplemented by a widespread knowledge of Greek, which was used with distinctive Jewish features (Wexler, 1985). Thus, Judeo-Aramaic and Judeo-Greek were the earliest Jewish languages that existed in a diglossic relationship with Hebrew.

Judeo-Aramaic was a Jewish adaptation of the major language of wider communication of the Middle East in the millennium before the Common Era. It grew into an important spoken and written Jewish language in Palestine and in the Jewish Diaspora in Babylon, where it was the main language used in the Babylonian Talmud (Greenfield, 1978; Katz, 1985). Among Jews as well as other inhabitants of the region, it was generally replaced by Arabic as a spoken language as a result of the spread of Islam, but it has continued to the present day as a Jewish language in more isolated regions such as Azerbaijan (Garbell, 1965) and Kurdish Iraq (Sabar, 2002).

The third partner in Palestinian trilingualism was Judeo-Greek, widely adapted in Hellenic colonies in Palestine and used by Diaspora Jews throughout the eastern Mediterranean and later in Italy. Judeo-Greek, also called Yevanic, was replaced in most areas starting in the 4th century. An exception is the communities of Romaniote Jews in Greece, which used Judeo-Greek until the influx of Sephardic Jews in the 16th century, when Judeo-Spanish became the majority language of Jews in Greece. Pockets of Judeo-Greek speakers maintained their language in Ioannina, Chalkida, and elsewhere until they were destroyed in the Nazi Holocaust. Few speakers survive today.

Soon after the Roman destruction of Jewish political independence in Palestine in the second century A.D., Hebrew lost its vitality. But it remained firmly entrenched as the language of Jewish religion and literacy, its transmission supported by a religious educational system. Over the next centuries, Jews in exile picked up local languages and developed their own distinctly Jewish varieties, depending in large measure on the nature of their relations with non-Jewish neighbors. As Jews migrated, they generally lost their former language and adapted linguistically to their new land, incorporating distinctive linguistic features. However, two languages defied this trend: Yiddish and Judeo-Spanish, Jewish varieties of Germanic and Hispanic languages, respectively. These languages continued to be used even centuries after their speakers migrated to new lands, where Slavic and Balkan languages were the norm.

In the modern period, when Jews have been able to integrate more fully into some societies, the distinctness of their languages has generally diminished. Yiddish, Judeo-Spanish, and other Jewish languages with long histories have lost significant numbers of speakers due to the combined effects of the Nazi Holocaust and Jews' cultural and linguistic assimilation into new societies in North America, Europe, and Israel. In the 21st century, Jews generally have full competence in the local languages, vernacular and standard. But their speech also tends to maintain some distinctive features, influenced by Hebrew and Aramaic as well as by the Jewish languages spoken by their ancestors.

Common Linguistic Features

Jewish languages tend to have a number of features in common. Structurally, they are generally based on a spoken variety of a non-Jewish language (Yiddish was based on medieval German and Judeo-Spanish on 15th century Spanish), with a large proportion of borrowings from Hebrew and Aramaic, from earlier Jewish languages, and from other contact languages (Weinreich, 1980). In addition, contemporary Jewish languages tend to be influenced by Israeli Hebrew as a result of affiliations with the State of Israel (Benor, 2004).

The Hebrew and Aramaic influences on Jewish languages are mostly lexical, but some phonological and morphosyntactic influences have been documented as well. Hebrew and Aramaic loan words are most common in the semantic fields of religious life, names of individuals and groups, and euphemism. Until recently, Jewish languages were generally written in Hebrew characters, because of common educational and literacy practices. Orthographic practices have varied, especially in the representation of vowels.

Jewish languages are often strongly influenced by a language spoken by the group's ancestors. In the case of Yiddish, the main previous Jewish language was Judeo-French. In the case of Judeo-Spanish, the main previous Jewish language was Judeo-Arabic. And in the case of Jewish English, the main previous Jewish language was Yiddish. These previous languages provide influences in lexicon, as well as other areas. In addition, the previous languages have a major impact on the use of Hebrew and Aramaic: which words are used, how they are pronounced, and how they are integrated morpho-syntactically.

Most Jewish communities have used the local language in distinctive ways in their translations of biblical and liturgical texts. These translations tend to render the local lexicon in word-for-word imitations of the Hebrew syntax. This practice is referred to in various ways, e.g., Judeo-Arabic *Sharḥ*, Yiddish *Taytsh*, and Judeo-Spanish *Ladino*.

The revitalization and re-vernacularization of Hebrew as part of the Zionist enterprise have produced a new situation, where modern Israeli Hebrew is markedly distinct from its earlier forms. Is this new variety to be considered a 'Jewish language'? Some have argued that it is too different from Diaspora Jewish languages to be classified with them. On the other hand, it shares many features: strong influence of the previous Jewish language (the Yiddish base is most evident in the highly modified grammar), a special place for Hebrew-Aramaic lexical items, borrowing from the co-territorial non-Jewish languages (including spoken Arabic and the widely known English), and Hebrew orthography.

The Most Widely Spoken Jewish Language: Yiddish

Distinctive linguistic features can be seen in the history of Yiddish, the most widely spoken Jewish language (Birnbaum, 1979; Weinreich, 1980; Katz, 1985; Weigel, 2002). According to the commonly accepted view (Weinreich, 1980), Yiddish was born towards the end of the first millennium A.D. when Judeo-French-speaking Jews started to settle in the Rhineland. During the more tolerant period that preceded the Crusades, these communities shifted from Judeo-French to a variety based on the German spoken in the area. This Judeo-German included elements of Hebrew and Aramaic, as well as other distinctive features. As a result of expulsion, persecution, and changing economic opportunity, many Jews migrated from Germanic-speaking to Slavic-speaking areas and brought their German language with them. In the changed social conditions, the developing Yiddish language maintained its German base while admitting influences from local Slavic languages in lexicon, morphosyntax, phonology, and discourse. In addition, Hebrew and Aramaic elements survived from previous generations, and new ones were added, mostly through contact with liturgical and rabbinic texts. A few Judeo-French lexical elements endured.

Over the centuries, Western Yiddish disappeared as a spoken language, assimilating towards co-territorial German, except in a few areas, like French-speaking Alsace. In eastern Europe, Yiddish developed into a complex web of dialects, differing mostly in phonology but also in lexicon and grammar.

Yiddish documents have been identified as early as the 13th century, and we have examples of epic poems written in Yiddish from the time of the Renaissance. In the early modern period, Yiddish was used mostly in women's religious literature, including translations and explanations of the Bible and liturgy. The mid-19th century saw the flowering of Yiddish literature, stemming from the eastern European Jewish Enlightenment. In the early 20th century, Yiddish became the object of language planning efforts, including a standardized orthography and linguistic documentation and research.

Events of the 20th century, especially immigration to America and Israel and the Nazi Holocaust, led to a major decline in the use of Yiddish, and today it is used as an everyday language mostly by the elderly and by pockets of Hasidic Jews in the New York area, Israel, and elsewhere (current estimates of total number of speakers range from 200 000 to 400 000). Reversing language shift efforts continue in educational and cultural programs, especially in New York, Montreal, Antwerp, and Mexico City. Young non-Hasidic Jews there and elsewhere continue to use Yiddish as an everyday language in an effort at revitalization.

Judeo-Spanish

Judeo-Spanish is an Hispanic language taken by exiles from Spain after the expulsion of 1492 to northern Europe, the Balkans and Turkey (Sephiha, 1979; Malinowski, 1982; Bunis, 1993; Harris, 1994; Quintana, 2002). There has been much debate about the name of this language: in addition to Judeo-Spanish, commonly used glottonyms are Ladino, Judezmo, and Spanyol, with some scholars maintaining that Ladino should refer only to the calque (word-for-word) translation language variety.

Already in Spain, Judeo-Spanish exhibited influences from Jewish and non-Jewish varieties of Arabic, as well as other distinctive features. When Sephardic Jews migrated, elements of Turkish, Greek, Bulgarian, and other languages were added. In addition, archaisms and independent developments distinguished

Judeo-Spanish from contemporaneous peninsular Castilian. Distinctive dialects of Judeo-Spanish formed throughout the Ottoman Empire. In the 19th and 20th centuries, the high-status French language had a major impact, due to influences of religious and secular education.

Judeo-Spanish developed literary functions, including a significant religious literature, a strong oral folk literature, and a corpus of modern belles lettres. There was rapid language loss in the 19th century as a result of emigration, Westernization, and assimilation. The Judeo-Spanish-speaking community in Greece and other Balkan countries was mostly wiped out in the Holocaust. Speakers in Turkey shifted first to French and more recently to Turkish. Today, it is estimated that there are only 30 000–50 000 speakers, mostly elderly.

A North African variety of Judeo-Spanish, called Haketiya, developed in northern Morocco after the 1492 expulsion. Its speakers mostly shifted to Spanish with the establishment of the Spanish Protectorate at the beginning of the 20th century.

Judeo-Arabic

Since even before the Muslim conquest of the Arabian peninsula in the 7th century A.D., Jews have lived alongside Arabic speakers, and they have spoken Jewish varieties of Arabic (Blanc, 1964; Blau, 1981; Hary, 1992; Bar-Asher, 1998). These have included Hebrew and Aramaic influences – mostly lexical, but also phonological, morphological, and syntactic. They have also included archaisms, standardized hyper- and hypo-corrections, and other distinctive features. Judeo-Arabic varieties have been documented in Iraq, Egypt, Syria, Morocco, and Yemen. Due to the migration of Jews within the Arab world, some varieties have features in common with other varieties of Judeo-Arabic that do not exist in the local non-Jewish Arabic dialects.

In the Middle Ages, many important Jewish religious and philosophical works were written in Middle Arabic and Judeo-Arabic. A word-for-word, or calque, translation variety, called *Sharḥ*, was used for translations of biblical, rabbinic, and liturgical texts. In addition, Judeo-Arabic was used for religious and secular literary production in the 19th century.

Most Jews in Arab lands immigrated to Israel in the 20th century, acquiring Israeli Hebrew and relegating Judeo-Arabic to private use. Those who stayed in Morocco tended to shift to French, and those who immigrated to North America and France tended to shift to the local languages there. It is estimated that there are currently 400 000–500 000 speakers (Grimes, 1996), mostly middle aged and older.

A Contemporary Jewish Language: Jewish English

Also referred to as Judeo-English, Yinglish, and Yeshivish, Jewish English is an umbrella term for the contemporary in-group varieties spoken by Jews in America, England, and other English-speaking countries (Gold, 1985; Steinmetz, 1986; Weiser, 1994; Benor, 2004). Jewish English is based on the local variety of English with many influences from Yiddish, textual Hebrew and Aramaic, and Israeli Hebrew in lexicon, syntax, phonology, and discourse. Because of the widespread literacy in contemporary English-speaking countries, Jewish English is not written in Hebrew characters. However, Hebrew loan words are sometimes inserted in their original orthography.

The varieties of Jewish English spoken by Orthodox Jews, especially those in larger, more isolated communities, are most distinct from general English, often to the point of being unintelligible to non-Jews and to non-Orthodox Jews. Orthodox Jewish English is a young language variety, and the number of speakers is growing as the Orthodox community expands. Although Jewish English is the youngest Jewish language that has been researched, it is likely not the only one that is gaining, rather than losing, speakers. As researchers explore the language of other contemporary Diaspora communities, it is expected that they will find similar distinctively Jewish linguistic practices.

Jiwarli

P K Austin, School of Oriental and African Studies, London, UK

Introduction

Jiwarli (Djiwarli) is an Australian Aboriginal language and was traditionally spoken along the upper reaches of the Henry River, a tributary of the Ashburton River, in the northwest of Western Australia. The language was unrecorded until 1978 and is now extinct, the last speaker, Mr. Jack Butler, having passed away in May 1985. Before his death, Jack Butler worked with Peter Austin to record over 70 texts in a range of genres, a lexicon of some 1500 words and elicitation of morphological paradigms and syntactic constructions. Publications on the language include a bilingual dictionary (Austin, 1992), a text collection (Austin, 1997), articles on morphosyntax (Austin and Bresnan, 1996; Austin, 1995, 1998, 2000, 2001) and a website. The language has become known in the linguistic literature for its nonconfigurational syntax (see Austin and Bresnan, 1996; Baker, 2000, and below), and it also shows switch-reference and a complex system of case-marking that reflects clause type (Austin, 2004). A reference grammar is in preparation.

Language Relationships

Jiwarli is closely related to its immediate neighbors, Warriyangka (Warriyangga), Thiin, and Tharrkari (Dhargari) as members of the Mantharta subgroup (*mantharta* being the word for 'person'). The languages share up to 80% common vocabulary and a similar grammatical system. Tharrkari has undergone a number of historical phonological changes that make its phonetics and phonology highly unusual for an Australian language (see further below). None of the Mantharta languages has any native speakers today, though some knowledge of words and expressions remains among descendants. The Mantharta languages are most closely related to the Kanyara languages spoken to their west and northwest: Payungu (Bayungu), Pinikura (Binigura), Purduna (Burduna), and Thalanyji (Dhalandji). They share approximately 60% cognate vocabulary and have a number of grammatical features in common, including switch-reference and clause linkage effects on case-marking (Austin, 1996, 2004). Today only Thalanyji continues to be spoken by older members of a single family living near Onslow, Western Australia. The Kanyara and Mantharta languages belong to the widespread Pama–Nyungan family, which covers the southern two-thirds of Australia (*see* **Australia: Language Situation**), and are most closely related to the Nyungic languages spoken to their east.

Linguistic Characteristics

Phonology

The phonological system of Jiwarli is typical of languages of the region, with contrastive stops at six points of articulation, a nasal for each stop position, a lateral for each nonperipheral stop, a flap, a semi-retroflex continuant, and two glides. Table 1 gives the relevant consonants in their practical orthographic form. There are just three vowels: high front *i*, high back *u*, and low *a*, with a phonemic length contrast mainly, but not exclusively, found in the first syllable of words. Tharrkari has undergone a number of historical phonological changes that have resulted in the creation of a stop voicing contrast (unusual in Australia) and, in one dialect, complete loss of laterals.

The general structure of Jiwarli roots is CV(C)CV(C). Every word in Jiwarli must begin with a consonant and end in a vowel; roots can end in a consonant but if otherwise unsuffixed *-ma* is added to nasal-final roots and *-pa* to roots ending in *l*, *rl*, *ly*, or *rr*. Word-initially only nonapico-domal stops and nasals and the two glides are found. Word-medially

Table 1 Consonants

	Bilabial	*Lamino-*		*Apico-*		*Dorse-velar*
		dental	*palatal*	*alveolar*	*domal*	
Stop	*p*	*th*	*j*	*t*	*rt*	*k*
Nasal	*m*	*nh*	*ny*	*n*	*rn*	*ng*
Lateral		*lh*	*ly*	*l*	*rl*	
Flap				*rr*		
Continuant					*r*	
Glide	*w*		*y*			

Table 2 Substantive cases

	A	*S*	*P*	*Dative*	*Locative*	*Allative*
boy	*wirtangku*	*wirta*	*wirtanha*	*wirtawu*	*wirtangka*	*wirtarla*
girl	*kurlkingku*	*kurlki*	*kurlkinha*	*kirlkiyi*	*kurlkingka*	*kurlkirla*
dog	*thuthungku*	*thuthu*	*thuthunha*	*thuthuwu*	*thuthungka*	*thuthurla*
fire	*karlangku*	*karla*	*karla*	*karlawu*	*karlangka*	*karlarla*
tree	*wurungku*	*wuru*	*wuru*	*wuruwu*	*wurungka*	*wururla*
hill 'roo	*mathantu*	*mathanma*	*mathannha*	*mathanku*	*mathanta*	*mathankurla*
tongue	*thalanythu*	*thalanyma*	*thalanyma*	*thalanyku*	*thalanytha*	*thalanykurla*
chin	*nyinyarntu*	*nyinyarnma*	*nyinyarnma*	*nyinyarnku*	*nyinyarnta*	*nyinyarnkurla*
wind	*yuwalpalu*	*yuwalpa*	*yuwalpa*	*yuwalku*	*yuwalpala*	*yuwalkurla*
cousin	*ngathalpalu*	*ngathalpa*	*ngathalpanha*	*ngathalku*	*ngathalpala*	*ngathalkurla*
barb	*ngarlirrpalu*	*ngarlirrpa*	*ngarlirrpa*	*ngarlirrku*	*ngarlirrpalu*	*ngarlirrkurla*

there are limited consonant clusters, primarily homorganic nasal plus stop, and apical nasal or lateral plus peripheral stop (*p* and *k*). Vowel clusters are not found. Words borrowed from English are generally restructured to meet these phonotactic constraints, e.g., *walypala* 'white man' (from 'white fella'), *ngayirlanma* 'island.'

Morphology

Jiwarli, like other languages of the Pama–Nyungan group, is entirely suffixing in its morphology. There are two major word classes, nominals and verbs, with nominals showing a rich system of case-marking and verbs marking tense/aspect/mood and dependent clause categories. Nominals can be subdivided into substantives (which cover both noun and adjective concepts in a language like English), pronouns, locationals, and demonstratives. Minor word classes include adverbs, particles, and interjections.

Nominals in Jiwarli inflect for case, with the syntactic functions of intransitive subject (S), transitive subject (A), and transitive object (P) showing a split-ergative pattern of syncretism in the case forms determined by animacy:

- for the first person singular pronoun, S and A fall together as a single (unmarked) form
- for inanimate nominals and demonstratives, S and P fall together as a single (unmarked) form
- for all other nominals, there are three forms for S, A, and P functions

In addition to the three main cases (nominative for S, ergative for A, accusative for P) there are also the following case forms:

- dative, marking alienable possession and complement of certain verbs
- allative, coding direction toward a place
- locative, coding location in a place, and complement of verbs of speaking
- ablative, coding direction from a place and cause

The actual forms of the cases are affected by the phonological shape of the root, e.g., whether it ends in a vowel or not, what kind of vowel or consonant is root-final, and how many morae it contains (long vowels counting as two mora). Table 2 sets out a sample substantive declension.

The coding of transitive object P varies according to clause type and crossclausal reference relations: in certain dependent clauses (for details, see below) P is marked as dative or as allative. In addition, case is added to dependent clause verbs to indicate cross-clausal coreference (see below), and manner adverbs in transitive clauses carry an ergative case agreement marker.

Jiwarli has a rich system of nominal word-building morphology that involves suffixation between the root and case inflection. Categories encoded in word-building morphology include number (dual, paucal, plural), having (e.g., *yakan-jaka* 'married [lit. spouse-having]'), lacking (e.g., *yakan-yirra* 'unmarried [lit. spouse-lacking]'), and kin dual and plural (e.g., *kurta* 'older brother,' *kurtarra* 'pair of brothers').

Pronouns in Jiwarli distinguish three persons and singular, dual, and plural number; in the first person non-singular there is an inclusive–exclusive contrast. Demonstratives encode a proximal and distal contrast. Table 3 sets out the basic pronoun and demonstrative forms.

Verbs morphologically distinguish between main verb and dependent verb inflections. Main verbs encode tense/aspect/mood categories such as past habitual, present, future, and imperative. Dependent verbs occur in hypotactically linked clauses and encode clause type (relative tense plus aspect) plus cross-clausal coreference or non-coreference of subjects (S or A), i.e., switch-reference (see further details in the syntax section below). There are five morphologically determined verb conjugations: conjugations one and two are primarily, but not exclusively, transitive,

Table 3 Pronouns and demonstratives

Intentive	*-lkarri(ngu)*	*-rrkarri(ngu)*	*-irarri(ngu)*	*-rarri(ngu)*	*-rarri(ngu)*
Might	*-lkangu*	*-rrkangu*	*-irangu*	*-rangu*	*-rangu*

and conjugations three, four, and five are intransitive. Table 4 sets out the verb conjugations.

Verbs show limited word-building morphology, mainly transitivizing and detransitivizing affixes that shift conjugation and transitivity. There are also category-changing affixes:

- nominalizing suffixes that create agent or instrument nominals from verbs
- verbalizing suffixes that create intransitive (inchoative) or transitive (causative) verbs from nominals.

The minor categories of adverb, particle, and interjection show no morphological variation. However, there is a set of postinflectional suffixes that may be attached to words of any class to encode various information status concepts, such as *-rru* for 'new information' and *-thu* for 'old information.' These affixes are ubiquitous in texts.

Syntax

Jiwarli is a nonconfigurational language (Hale, 1983; Austin and Bresnan, 1996; Baker, 2000) and shows the following syntactic characteristics:

- free word order, in which any possible order of sentence constituents is found (Austin, 2000)
- split-NP syntax, in which nominals understood as referring to a single entity can be separated in the clause by other constituents (each nominal bearing a relevant case marker)
- free argument ellipsis, in which nominals of any person or number whose reference is clear from the context can be freely omitted (Austin, 2001).

The following example illustrates split-NP syntax:

(1) *Karla* *wantha-nma-rni* *jarnpa* *juma*
fire.ACC give-IMPER-hence light.ACC small.ACC
'Give me a small fire light' [T52s15]

Free elipsis of arguments is seen in the following (see also line 68 in the text example below):

(2) *Wirntupinya-nyja-rru*
kill-PAST-NEW.INF
'(They) killed (him)' [T42s25]

Jiwarli also shows interesting interclausal syntax. Dependent clauses occur hypotactically located on the margins of main clauses, and their verbs encode clause type plus switch-reference, i.e., (non-)coreference of subject (S or A) between the main and dependent clause. In same-subject clauses the dependent clause subject is obligatorily unexpressed (these being 'control' structures). When the main clause is transitive, some same-subject dependent clause verbs carry an ergative case marker in agreement with the controlling subject nominal. The following examples illustrate this:

(3) *Mantharta* *kumpa-inha* *wurnta-wu*
man.NOM sit-PRES shield-DAT
yinka-rnu
adze-IMPERF.SS
'The man sits adzing a shield' [N11p31s3]

(4) *Nhurra-kara-lu* *thika-nma*
you-PL-ERG eat-IMPER
yarrukarri-ngu-ru-thu
want-IMPERF.SS-ERG-old.INF
'You eat it if you want it!' [N11p39s3]

For different-subject dependent clauses, if there is coreference between the (omitted) subject of the dependent clauses and a nonsubject in the main clause, an agreement case marker appears on the dependent verb, as in:

(5) *Tharla-nma* *yinha* *julyu-nha*
feed-IMPER this.ACC old man-ACC
kamu-rri-ya-nha
hunger-INCHOAT-IMPERF.DS-ACC
'Feed this old man who is becoming hungry!' [JIT13s1]

Notice that there is a complex interaction between the marking of P inside the dependent clause (as dative, allative, or accusative) depending on clause type and crossclausal coreference relations. Table 5 illustrates this.

Table 5 Coding of P

	Dependent object
Intentive	Dative
Imperfective-SS	Dative
Perfective-SS	Dative
Imperfective-DS	Dative
Perfective-DS	Dative
Purposive-SS	Allative
Purposive-DS	Accusative
Might	Accusative

The significance of these patterns is explored more generally in Austin (2004).

Particles in Jiwarli have scope over the whole clause and encode such semantic concepts as negation, possibility, etc. An example is *warri* 'not' in (see also *kaji* 'try' in text line 15 below):

(6) *Nhaa-rri-nyja* *nhurra* *warri*
what-INCHOAT-PAST you.ERG not
kurlkayi-rnu *wangka-iniya-wu* *nganaju*
listen-IMPERF.SS talk-IMPERF.DS-DAT I.DAT
'Why didn't you listen to me talking?' [T35s7]

Text Example

The following extract (Text 43 in Austin, 1997) exemplifies the morphological and syntactic characteristics of Jiwarli and shows a little of the cultural background of the language. It comes from a traditional story in which one bird steals fire from the people, who then ask the Peregrine falcon to get it back from the thief:

(7) *Ngana-lu* *ngunha* *karla* *mana-ra*
who-ERG that.ACC fire.ACC get-FUT
'Who will get the fire?'

(8) *Nhurra* *parru*
2SG.NOM then
'How about you?'

(9) *Nhurra* *karlathintirnira* *kurukurura,*
2SG.NOM Peregrine falcon Peregrine falcon
nhurra *yini-thu*
2SG.NOM name.NOM-OLD.INF
'You are karlathintirnira Peregrine falcon, (that's) your name.'

(10) *Ngaa*
yes
'Yes'

(11) *Ngunha* *thurni-nyja-nthi*
that.NOM laugh-PAST-just
'He just laughed'

(12) *Yana-nyja* *ngunha* *purtipala-rru*
go-PAST that.NOM pretty.NOM-NEW.INF
'He was pretty now'

(13) *Wantha-rninyja* *juuri* *wangkarr-a*
put-PAST paint.ACC throat-LOC
'(They) put paint on (his) throat'

(14) *Wantha-rninyja* *kala-pa* *wangkarr-a*
put-PAST like this-SPEC throat-LOC
'(They) put (it) like this on (his) throat'

(15) *Kaji* *nhurra* *yana-ma* *mana-ngku*
try 2SG.NOM go-IMPER get-PURP.SS
ngurlu *karla-rla*
that.ALL fire-ALL
'You try to go and get the fire'

Johnson, Samuel (1709–1784)

W Hüllen, Düsseldorf, Germany

Samuel Johnson was born as the son of a bookseller in Lichfield in 1709 and died in London in 1784. He was an intellectually precocious boy, devouring literature in a desultory manner, and later a young man of often unpredictable habits and uncouth appearance. This was to become his lifestyle, which alternated with lapses into deep melancholy. In spite of the irregularities of his character, his deep sympathy for underprivileged persons and servants was unanimously praised. At Oxford (Pembroke College), he read Greek and 'metaphysics.' In 1729, he left the university before obtaining a degree, probably because his means failed. (The degree of LL.D., which later became habitually attached to his name, was conferred upon him by the University of Dublin as late as 1765 and by the University of Oxford even later in 1775. He rarely used it himself.) After several attempts at gaining a position at schools in the neighborhood of Lichfield, he left for London in 1737, where he stayed for the rest of his life.

Samuel Johnson was determined to make a living as an *homme de lettres* and, after enduring utmost poverty for many years, finally succeeded in doing so. His literary works were of only limited success. Today they are regarded as fine, though obsolete, specimens of classicist literature. Apart from their formal achievements, they gave rise to the general appreciation of Samuel Johnson as a morally strong and religiously motivated character. Among them were the tragedy *Irene* (1736, staged by Garrick in 1749), the long poem 'Vanity of Human Wishes,' written in the imitation of the tenth satire of Juvenal (1749), and the novel *Rasselas, Prince of Abyssinia* (1759). All of them quote historical examples of the deceptive nature of human achievements and the everlasting and unique salvation in God. They propose this message using a severe and dignified eloquence that was felt to be exemplary.

More successful were Johnson's *ad hoc* publications (prologues to plays, reviews, political pamphlets) and his contributions to various journals. From 1731 on he wrote regularly for the *Gentlemen's Magazine*. Among his contributions written between 1738 and 1744 were parliamentary debates, some of which he only corrected or wrote on the basis of reports; he was never in the gallery himself. Between 1750 and 1752, he issued the *Rambler*, which appeared twice a week, by writing the whole paper himself with a few exceptions. The project was not successful but later gained a high reputation and good sales when it was edited in collected volumes. In 1753 and 1754, he contributed to the *Adventurer*. Between 1756 and 1758, he edited the *Literary Magazine, or Universal Review*, again writing a good many of the articles

Johnson, Samuel (1709–1784)

W Hüllen, Düsseldorf, Germany

Samuel Johnson was born as the son of a bookseller in Lichfield in 1709 and died in London in 1784. He was an intellectually precocious boy, devouring literature in a desultory manner, and later a young man of often unpredictable habits and uncouth appearance. This was to become his lifestyle, which alternated with lapses into deep melancholy. In spite of the irregularities of his character, his deep sympathy for underprivileged persons and servants was unanimously praised. At Oxford (Pembroke College), he read Greek and 'metaphysics.' In 1729, he left the university before obtaining a degree, probably because his means failed. (The degree of LL.D., which later became habitually attached to his name, was conferred upon him by the University of Dublin as late as 1765 and by the University of Oxford even later in 1775. He rarely used it himself.) After several attempts at gaining a position at schools in the neighborhood of Lichfield, he left for London in 1737, where he stayed for the rest of his life.

Samuel Johnson was determined to make a living as an *homme de lettres* and, after enduring utmost poverty for many years, finally succeeded in doing so. His literary works were of only limited success. Today they are regarded as fine, though obsolete, specimens of classicist literature. Apart from their formal achievements, they gave rise to the general appreciation of Samuel Johnson as a morally strong and religiously motivated character. Among them were the tragedy *Irene* (1736, staged by Garrick in 1749), the long poem 'Vanity of Human Wishes,' written in the imitation of the tenth satire of Juvenal (1749), and the novel *Rasselas, Prince of Abyssinia* (1759). All of them quote historical examples of the deceptive nature of human achievements and the everlasting and unique salvation in God. They propose this message using a severe and dignified eloquence that was felt to be exemplary.

More successful were Johnson's *ad hoc* publications (prologues to plays, reviews, political pamphlets) and his contributions to various journals. From 1731 on he wrote regularly for the *Gentlemen's Magazine*. Among his contributions written between 1738 and 1744 were parliamentary debates, some of which he only corrected or wrote on the basis of reports; he was never in the gallery himself. Between 1750 and 1752, he issued the *Rambler*, which appeared twice a week, by writing the whole paper himself with a few exceptions. The project was not successful but later gained a high reputation and good sales when it was edited in collected volumes. In 1753 and 1754, he contributed to the *Adventurer*. Between 1756 and 1758, he edited the *Literary Magazine, or Universal Review*, again writing a good many of the articles

himself. All this meant accomplishing an enormous amount of work, even during the period when he was busy compiling his dictionary. The pecuniary conditions of his life improved considerably when he was granted a pension by George III in 1762.

Samuel Johnson then became an outstanding figure of the intellectual scene in London. Nearly every distinguished man of letters of the period came into contact with him, with the exception of the disliked David Hume (Dictionary of National Biography, DNB). In 1763, he made the acquaintance of James Boswell, and started a friendship that lasted even beyond the grave, as his friend published the well-known and exemplary biography *Life of Samuel Johnson* (1791). In the same year, the 'Club' was founded – a regular gathering of influential intellectuals in London, where he was the master of conversation, an ability in which he excelled like nobody else. In 1764, his long acquaintance with Mr and Mrs Thrale (later Mrs. Piozzi) began. He almost became a member of their family. These were also the years of his most mature literary achievements – the Shakespeare edition (1765) and the *Lives of the English poets* (1779–1781).

On June 18, 1746, five booksellers from London contracted with Samuel Johnson to produce a dictionary of English within three years for the sum of 1575 pounds. On April 30 of the same year, Johnson wrote his plan for the dictionary, and he sent a slightly altered version to the Earl of Chesterfield one year later. His hopes of patronage and financial assistance, however, came to nothing. Later, he complained bitterly about this. For nine years, Johnson and six amanuenses worked on the project. Its first volume appeared on April 15, 1755. The two volumes together contained 2300 folio pages with 40 000 entries in total. Each of them consists of the lemma, the determination of word class, in the case of a derived word its stem, etymological references, the definition of meaning(s) by synonym or paraphrase, and quotations from 'good authors.' The amanuenses culled the lemmata and the quotations from books, while Johnson himself provided the definitions and selected the quotations. Both are rightly regarded as praiseworthy and as showing his true genius for language. The dictionary is introduced by a grammar, a history of the language, and a preface. In this preface, Samuel Johnson explained the achievements of his work and admitted that many of his initial aims could not be accomplished. It is a moving testament to his intellectual sincerity.

Samuel Johnson praised the copiousness, energy, variety, and purity of the English language, as used by 'good' authors from Spencer to the Restoration of 1660, but he criticized a lack of order and rules since then. For him, this was the consequence of ignorance, vulgarity, and caprice. He wished to counter these with the ideals of classical rhetoric – brevity, congruity, and perspicuity. It is in this ambition of fixing language use in the sense of these ideals that he admitted having failed. His idealist belief in the necessity of a linguistic norm was thus challenged by the realism of the evaluation of his own work.

The *Dictionary of the English language* was the unquestioned lexicographical authority for language use in England until 1887, when the first volume of what was later to become the *Oxford English dictionary* appeared. It was taken by many as a substitute for a centralized linguistic academy such as the Italians and the French had (and have).

Johnston Atoll: Language Situation

Editorial Team

Johnston Atoll, located in the central Pacific Ocean between the Hawaiian and Marshall Islands, is one of the most isolated places in the world. Of volcanic formation, Johnston Atoll is a broad, shallow platform of about 50 square miles with four islands and a marginal, emergent reef on its northwestern side. In 1858, both the United States and the Kingdom of Hawaii annexed the uninhabited Atoll, which eventually became an American possession. Initially, the atoll was exploited for its guano deposits; subsequently, it became a designated wildlife refuge, but this last incarnation did not last long. In the 1930s, the Atoll passed into the hands of the military. Johnston Atoll has been chosen for test launchings of nuclear missiles and it contains a landfill of plutonium-contaminated waste; more than 4 million pounds of chemical weapons have been destroyed on Johnston since 1990. The military has been gradually decreasing its activity and presence on the Atoll, and as of January 2004, Johnston's population had fallen to about 200 Air Force and civilian personnel, all English-speaking.

Jones, Daniel (1881–1967)

B S Collins, Leiden University, Leiden, the Netherlands
I M Mees, Copenhagen Business School, Copenhagen, Denmark

Daniel Jones, the leading British phonetician of the 20th century, was born in London on September 12, 1881, the son of a successful London barrister. He was educated at Ludgrove preparatory school, Radley College, and University College School before going on to read mathematics at Cambridge. Jones graduated with a B.A. in 1903 (converted by payment to M.A. in 1907) but while still a student discovered that he possessed remarkable linguistic talents. Out of interest, he began attending language courses during his vacations, and it was on one such occasion at Marburg, Germany, in 1900 that he was to encounter the renowned language teacher and skilled practical phonetician William Tilly. Jones later explained that this was his introduction to phonetics, and he held Tilly in highest regard thereafter (Collins and Mees, 1999: 12–17).

After graduation, Jones was reluctantly persuaded by his father to take up law. Nevertheless, by pleading ill health, Jones managed to interrupt his legal training in 1905 in order to spend a year in Paris studying under the eminent linguist Paul Passy, whom he soon got to know as a personal friend, and whose niece he married in 1911. Passy acted as guide and mentor to Jones in these early years, encouraging him to take the International Phonetic Association (IPA) examination and to make phonetics his career. Jones performed brilliantly for the IPA certificate, which turned out to be the only linguistic qualification he was ever to obtain (apart from honorary doctorates, Dr. Phil., Zürich, 1936; LL.D., Edinburgh, 1958). He did, however, take private lessons in practical ear-training from Henry Sweet, whom he was later to regard as another strong formative influence.

In 1907, Jones was called to the bar, but never practiced as a barrister, having in the meantime obtained a part-time post teaching phonetics at University College London – then in its infancy as an academic discipline in Britain. The new subject proved popular with students, and eventually, in 1912, Jones was able to set up his own phonetics laboratory and was appointed by London University to be head of the first British university department of phonetics. He was promoted to Reader in 1914 and awarded a chair in 1921 – a post in which he remained until 1949. Upon retirement, he was designated Professor Emeritus.

The year 1912 was also coincidentally when Bernard Shaw completed his first drafts of *Pygmalion,* a play mainly concerned with phonetic matters, and Jones was called upon to provide him with help and advice on technical points. Contrary to previous belief, it now seems likely that it was Daniel Jones, rather than Henry Sweet, who was the chief inspiration for Shaw's fictional phonetician hero Henry Higgins. To avoid any suspicion that Higgins was based on a living phonetician, and thus prevent a possible libel suit, Shaw appears to have attempted to fog the issue by inserting into the Preface to the first published edition of the play (1916) deliberately distracting remarks about the recently deceased Sweet (Collins and Mees, 1999: 97–103).

Jones performed brilliantly for the IPA certificate, which turned out to be the only linguistic qualification he was ever to obtain (apart from honorary doctorates, Dr. Phil., Zürich, 1936; LL.D., Edinburgh, 1958). He did, however, take private lessons in practical ear-training from Henry Sweet, whom he was later to regard as another strong formative influence.

In 1907, Jones was called to the bar, but never practiced as a barrister, having in the meantime obtained a part-time post teaching phonetics at University College London – then in its infancy as an academic discipline in Britain. The new subject proved popular with students, and eventually, in 1912, Jones was able to set up his own phonetics laboratory and was appointed by London University to be head of the first British university department of phonetics. He was promoted to Reader in 1914 and awarded a chair in 1921 – a post in which he remained until 1949. Upon retirement, he was designated Professor Emeritus.

The year 1912 was also coincidentally when Bernard Shaw completed his first drafts of *Pygmalion,* a play mainly concerned with phonetic matters, and Jones was called upon to provide him with help and advice on technical points. Contrary to previous belief, it now seems likely that it was Daniel Jones, rather than Henry Sweet, who was the chief inspiration for Shaw's fictional phonetician hero Henry Higgins. To avoid any suspicion that Higgins was based on a living phonetician, and thus prevent a possible libel suit, Shaw appears to have attempted to fog the issue by inserting into the Preface to the first published edition of the play (1916) deliberately distracting remarks about the recently deceased Sweet (Collins and Mees, 1999: 97–103).

In this initial period of his career, Jones produced a flood of publications, his first commercial success being the compact *Pronunciation of English* (1909). The more ambitious *Outline of English phonetics* (1918), aimed at the nonnative learner, was much more comprehensive and can claim to be the earliest reliable full account of what Jones was later to term 'Received Pronunciation' (RP). Its descriptive framework penetrated linguistics worldwide, influencing Bloomfield and the post-Bloomfieldians of the American Structuralist School. In 1913, Jones co-edited (with Hermann Michaelis) the *Phonetic dictionary of the English language*, the first serious attempt at a dedicated pronunciation dictionary for English in over 100 years. It was soon overtaken by the success of Jones's own *English pronouncing dictionary* (1917a). The *EPD* (as it is always known) rapidly became the recognized authority on RP usage and (in revised form) remains in print to the present day.

Jones pioneered research on non-European languages, producing concise but significant early studies, notably on Cantonese (Jones and Woo, 1912), Tswana (Jones and Plaatje, 1916), and Sinhalese (Sinhala) (Perera and Jones, 1919). Jones's truly groundbreaking research on tone languages is now once again beginning to get the recognition it deserves. His notable description of Tswana contains the first systematic analysis of a register tone language taking in downstep (Jones and Plaatje, 1916: xxv–xxxi). Jones (1917b) expanded on this research; a later innovation was the raised exclamation mark (ꜝ) commonly used for the downstep feature (Jones, 1928: 3). Jones's work on African languages was subsequently continued and expanded by several of his London colleagues and pupils, including Lilias Armstrong, Ida Ward, Clement Doke, Eugénie Henderson, A. N. Tucker, and Jack Carnochan.

Jones did not neglect European languages. The *Pronunciation of Russian* (co-authored with Michael Trofimov), for a long period the only reliable phonetic description in English of the sound system of that language, was published in 1923. At the very end of his life Jones was to rewrite this book together with Dennis Ward, and under the new title *Phonetics of Russian* it appeared in 1969. In 1927, Jones produced (with Emile Stéphan) *Colloquial French,* issued with what at the time was considered a startling innovation – no fewer than 15 gramophone discs containing approximately 90 minutes of spoken material. This proved to be a most successful pioneering example of the audio-lingual method and can be regarded as a milestone in applied linguistics and the history of language teaching.

Jones's (1917c) article, published in *Nature*, is the first detailed exposition of his influential theory of cardinal vowels. Based on ideas derived in part from Paul Passy but also showing the influence of Alexander Melville Bell, Henry Sweet, and the British phonetician Richard Lloyd, it provided a simple dual-parameter model of vowel description based on tongue-arch height and lip-shape. Despite the lack of adequate supporting radiographic evidence, Jones subsequently elaborated the theory, arriving eventually at a system of eight rounded and eight unrounded front and back vowels at supposedly articulatorily equidistant intervals, plus two close central vowels (Collins and Mees, 1995). Jones produced three disc recordings of the cardinal vowels (1917d, 1943, 1956), the last version being nowadays the best known. The cardinal vowel system – although today in some disrepute in the light of contradictory instrumental data – has been widely used since its inception, and much present-day vowel description still derives ultimately from Jones's model (cf. Butcher, 1982). It is noteworthy that a diagram based almost totally on Jones's vowel scheme still appears on the current (1996) IPA chart (see Figure 1).

Jones was the first English writer (from 1917 onward) to use and promulgate the word 'phoneme' in its current sense, borrowing the term from the followers of Baudouin de Courtenay and interpreting it

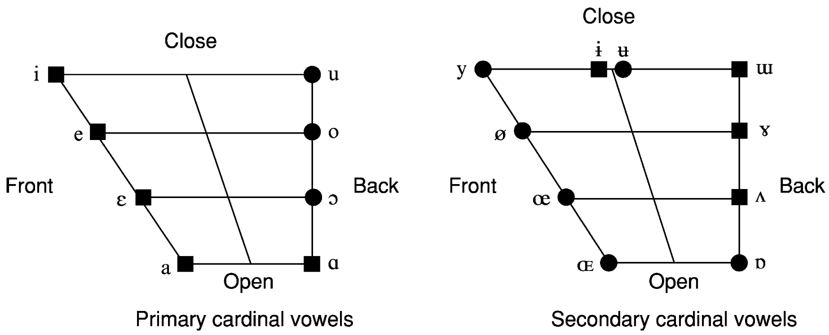

Figure 1 Jones's system of primary and secondary cardinal vowels in updated form. Lip shape is indicated by squares (spread-neutral) and circles (rounded).

as a 'family of sounds' related by physical criteria. As a result, the phoneme principle became firmly established in British linguistics well before the advent of either the Prague School or American structuralism, as Jones himself points out in his *History and meaning of the term 'phoneme'* (1957). After Jones suffered a nervous breakdown in 1920, his dynamic productivity diminished somewhat, but he went on in his later years to write numerous articles and produce important revisions of his major works. His main effort was directed to writing *The phoneme* (1950), which he regarded as his life's work. On publication, even though the large collection of reliable language data was much admired, Jones's static theoretical position – essentially unchanged from 1917 – disappointed contemporary critics.

Jones was, together with Paul Passy, the main force behind the IPA (Assistant Secretary 1906–1927; Secretary 1927–1950; President 1950–1967). He was also editor of its influential journal *Le Maître Phonétique* and from 1906 onward played a leading role in spreading the IPA alphabet worldwide. Jones was an active supporter of English spelling reform and also helped devise schemes for new alphabets for African and Indian languages. In 1926, he became a founding member of the BBC Advisory Committee on Pronunciation and from 1942 to 1967 was chief pronunciation advisor to the BBC. In this role, he was to a degree responsible for reinforcing the notion of 'BBC English' as a standard, but Jones himself was from early on in his career advanced in his libertarian views on pronunciation. Although he revived the Victorian term 'received pronunciation' and the abbreviation RP in the (1926) third edition of the *EPD*, he deprecated any attempt to prescribe a standard pronunciation model for native speakers. He was a keen observer of linguistic change, and was the first to note the spread of glottalization in British English and the increasing influence of popular London speech on RP, thus foreseeing the advance of what is nowadays termed 'estuary English' (Collins and Mees, 2001).

Although now somewhat dated, Jones's works (many of which have recently been re-issued together with hitherto unpublished notes, lectures, and correspondence; Collins and Mees, 2003) remain outstanding both for their detailed phonetic observation and their lucidity. They established him as the best-known phonetician of his generation, and his ideas and methods, propagated by colleagues and pupils forming what Jones (1948) himself termed the London School of Phonetics, have continued to influence many areas of phonetics and pronunciation teaching. (Note that the term London School was later, confusingly, applied to a totally different group of linguists, namely J. R. Firth and his followers.)

Jones can fairly be placed among the leading figures in 20th century linguistics and, together with Henry Sweet, can be considered the greatest of all British phoneticians.

Despite crippling illness, Jones remained working on his publications even in his last years. He died on December 4, 1967, at his home in Gerrards Cross, England.

Jones, William, Sir (1746–1794)

M Pierce, University of Michigan, Ann Arbor, MI, USA

Although the law was his profession, Sir William Jones is most famous for his contributions to linguistics, specifically for his 1786 observation about possible genetic relationships between Sanskrit and certain other languages, which formed the basis of scientific historical/comparative linguistics. A spectacular polyglot (sometimes credited with knowledge of over 20 languages) born in 1746, Sir William showed his interest in languages at an early age, thoroughly mastering Latin, Greek, French, and Italian while a schoolboy at Harrow, and at the same time beginning to study Hebrew and Arabic. In 1764 he enrolled at Oxford, where he continued his studies of languages, adding Portuguese, Spanish, and Persian to his repertoire. In 1766 he became a Fellow of University College, Oxford; in 1772 a Fellow of the Royal Society; and in 1773 a member of the Literary Club headed by Samuel Johnson. In 1768 he received a B.A. from Oxford and an M.A. from the same institution in 1773. Financial pressures eventually caused him to switch his field of study to law, and in 1774 he began practicing law in London. In March 1783 he was appointed to a judgeship in Calcutta and was knighted at the same time. (Edgerton [1946] notes that Jones had been a candidate for this position since 1778, and that his appointment had been delayed because of his open opposition to British action in the American Revolution.) Shortly after arriving in India, Jones founded the Asiatick Society (later renamed the Asiatic Society of Bengal) and presided over the society until his death. Life in India unfortunately adversely affected his health, and Jones died before reaching his forty-eighth birthday in 1794.

Although Jones was not able to devote himself fully to linguistics because of the heavy commitments of his judgeship, and despite his early death, Jones produced a substantial amount of linguistic scholarship (to say nothing of his writings on various legal topics, as well as on other subjects of interest to him, like chess). Jones's most famous work is certainly his lecture, originally presented to the Asiatick Society in February 1786, in which he advanced the theory that Sanskrit was certainly related to Latin and Greek, and possibly to the Celtic, Germanic, and Iranian languages as well. Most importantly, he suggested that this relationship was genetic (i.e., that the relevant languages were descended from a common ancestor). This proposal remains the basis of comparative linguistics.

Even if this had been Jones's only contribution to linguistics, his place in the history of the field would have been secure. However, this was not the only important piece of linguistic scholarship produced by Jones. His interest in Persian had led him to write a Persian grammar, originally published in 1771. Although this work was certainly flawed (see Cannon [1958] for extensive critical discussion), it also filled a gap and remains a testament to Jones's ability (all the more so given that he had apparently taught himself the language and that he was not yet 25 years old when it was published). Jones was also well-known for his translations of Indic and Iranian texts; his first effort in this area, a translation of a Persian manuscript on the life of Nadir Shah into French, was undertaken at the request of the king of Denmark, who owned the manuscript in question, and was published in 1770. The same year he published a book-length study of Persian poetry (Jones, 1770), as well as translations of some of Hafiz' odes into French. Possibly even more important than his

A spectacular polyglot (sometimes credited with knowledge of over 20 languages) born in 1746, Sir William showed his interest in languages at an early age, thoroughly mastering Latin, Greek, French, and Italian while a schoolboy at Harrow, and at the same time beginning to study Hebrew and Arabic. In 1764 he enrolled at Oxford, where he continued his studies of languages, adding Portuguese, Spanish, and Persian to his repertoire. In 1766 he became a Fellow of University College, Oxford; in 1772 a Fellow of the Royal Society; and in 1773 a member of the Literary Club headed by Samuel Johnson. In 1768 he received a B.A. from Oxford and an M.A. from the same institution in 1773. Financial pressures eventually caused him to switch his field of study to law, and in 1774 he began practicing law in London. In March 1783 he was appointed to a judgeship in Calcutta and was knighted at the same time. (Edgerton [1946] notes that Jones had been a candidate for this position since 1778, and that his appointment had been delayed because of his open opposition to British action in the American Revolution.) Shortly after arriving in India, Jones founded the Asiatick Society (later renamed the Asiatic Society of Bengal) and presided over the society until his death. Life in India unfortunately adversely affected his health, and Jones died before reaching his forty-eighth birthday in 1794.

Although Jones was not able to devote himself fully to linguistics because of the heavy commitments of his judgeship, and despite his early death, Jones produced a substantial amount of linguistic scholarship (to say nothing of his writings on various legal topics, as well as on other subjects of interest to him, like chess). Jones's most famous work is certainly his lecture, originally presented to the Asiatick Society in February 1786, in which he advanced the theory that Sanskrit was certainly related to Latin and Greek, and possibly to the Celtic, Germanic, and Iranian languages as well. Most importantly, he suggested that this relationship was genetic (i.e., that the relevant languages were descended from a common ancestor). This proposal remains the basis of comparative linguistics.

Even if this had been Jones's only contribution to linguistics, his place in the history of the field would have been secure. However, this was not the only important piece of linguistic scholarship produced by Jones. His interest in Persian had led him to write a Persian grammar, originally published in 1771. Although this work was certainly flawed (see Cannon [1958] for extensive critical discussion), it also filled a gap and remains a testament to Jones's ability (all the more so given that he had apparently taught himself the language and that he was not yet 25 years old when it was published). Jones was also well-known for his translations of Indic and Iranian texts; his first effort in this area, a translation of a Persian manuscript on the life of Nadir Shah into French, was undertaken at the request of the king of Denmark, who owned the manuscript in question, and was published in 1770. The same year he published a book-length study of Persian poetry (Jones, 1770), as well as translations of some of Hafiz' odes into French. Possibly even more important than his

translations of Persian poetry, however, are his translations of Sanskrit texts. He was the first, for example, to translate the *Sakuntala* into English; his version was itself later translated into a number of European languages, including a German version that inspired Goethe to mention it in one of his own poems. Jones also translated Chinese texts, albeit somewhat less successfully.

The 1993 publication of his collected works, as well as the 1990 biography by Garland Cannon and the consistent citation of his 1786 lecture in historical linguistics handbooks should ensure that Sir William Jones is not forgotten.

Jonson, Ben (1572–1637)

S Watanabe, Tokyo, Japan

Better known as a dramatist and poet than a grammarian, Benjamin Jonson (usually called Ben Jonson) learned classical literature at Westminster School, under William Camden, and St. John's College, Cambridge. After joining the English troops in Flanders, he returned to London and began working for the stage both as a player and as a playwright in approximately 1595. In 1598 he killed a fellow actor in a duel. Escaping the gallows by benefit of clergy, he became a Roman Catholic during imprisonment, but abjured 12 years later.

His first extant comedy, *Every man in his humour*, which launched him to instant literary fame, was performed by the Lord Chamberlain's company at the Globe in 1598, with Shakespeare in the cast. Following this work, his representative comedies made him the founder of the tradition of 'comedy of humours' or 'comical satires.' His first extant tragedy, *Sejanus*, a play based on Tiberius and his Captain of the Guards, was ill received by the audience at large, but was greatly admired by cultivated persons for his classical erudition.

The accession of James to the throne in 1603 provided him with opportunities to write a long series of court masques. His classical learning and his unique talent for erudite pageantry commended him to King James and Queen Anne. James granted him a pension, thus making him the *de facto* first Poet Laureate. His poems were published in *The forest* (1616) and *Underwoods* (1640). As a literary critic he was the most potent vindicator of the tradition of classical drama and writer in that tradition in sharp contrast to the romantic drama of the preceding Elizabethan Age. His *Timber, or discoveries* (1640) is a landmark achievement in the history of literary criticism. Called the 'rare Ben Jonson,' he was buried in Westminster Abbey with a portrait bust put up on the south wall of Poets' Corner.

Jonson's substantial knowledge of classical literature led him to regard the *status quo* of English as an unruled language. This recognition of his made him one of the very few who wrote a grammar book for English before the 18th century. The relative freedom of grammatical rules in Elizabethan English began to move toward an increasingly stricter code. His *English grammar* is as strongly influenced by Petrus Ramus as many other early English grammarians such as Alexander Gill and Charles Butler were. At the same time, the influences of the traditional Latin grammar books of the Middle Ages such as Alexander de Villa-Dei's *Doctrinal*e are observed in such idiosyncratic technical terms as 'asyndeton' and 'polysyndeton.' The first manuscript of his *English grammar* was destroyed in a fire that ruined his library, one of the richest in England, in 1623. His extant *English grammar* was included posthumously in the two-volume folio edition of his works in 1640.

Joos, Martin (1907–1978)

J G Fought, Diamond Bar, CA, USA

Martin Joos [džows] was born in Wisconsin. He studied electrical engineering at the University of Wisconsin for a time, but never completed an undergraduate degree. He was one of the field workers on the Linguistic Atlas of New England project in 1931–1932, then completed an A.M in 1935 and a Ph.D. in 1941 at Wisconsin. He was a lecturer in German at the University of Toronto from 1935 to 1942. From 1942 to 1946, Joos worked as a linguist and cryptographer at the Signal Security Agency in Washington and was an associate editor of *Studies in Linguistics*. He became an Associate Professor in the German department at the University of Wisconsin in 1946 and Professor in 1949, chairing the department from 1962 to 1964. From 1967 to 1972, he was again at Toronto, as Professor and Director of its Center for Linguistic Studies. He received Emeritus rank in 1972.

Joos's most influential work as a Germanist was the meticulously edited *Reader* (1951). He was interested in phonetics as early as 1930, and in 1948 produced the first manual of acoustic phonetics that exploited the new technology of the sound spectrograph. His short paper on the historical and phonological implications of English intervocalic apical stops (1942) is still the best statement on this topic. But his strongest influence on descriptive linguistics was exercised through the selection of papers published in 1957 as *Readings in linguistics.* His selection of papers, perceived omissions, and very personal comments on each paper created a furor; the book was a strong seller for many years. In a memoir on the history of the Linguistic Society (published in part in 1986), his personal views and anecdotes are mingled with more conventional historical details.

Joos was a most unconventional man: he seemed interested in everything around him, yet also absorbed in his thoughts to the point of distraction. He was a very effective teacher. Although his irreverence for social and professional conventions (except as data) would frequently and in some cases permanently exasperate his colleagues, he took his students, sophomores and all, very seriously, treating them with courtesy and patience: the *Readings* were prepared for them, above all. His 1972 paper on a single word in *Parzifal* shows something of what his classes were like. I have heard several versions of a quip about him: "If you ask Martin Joos what time it is, he'll tell you how to build a watch." He might well have accepted this as a compliment. And that watch would keep time.

Joos, Martin (1907–1978)

J G Fought, Diamond Bar, CA, USA

Martin Joos [džows] was born in Wisconsin. He studied electrical engineering at the University of Wisconsin for a time, but never completed an undergraduate degree. He was one of the field workers on the Linguistic Atlas of New England project in 1931–1932, then completed an A.M in 1935 and a Ph.D. in 1941 at Wisconsin. He was a lecturer in German at the University of Toronto from 1935 to 1942. From 1942 to 1946, Joos worked as a linguist and cryptographer at the Signal Security Agency in Washington and was an associate editor of *Studies in Linguistics*. He became an Associate Professor in the German department at the University of Wisconsin in 1946 and Professor in 1949, chairing the department from 1962 to 1964. From 1967 to 1972, he was again at Toronto, as Professor and Director of its Center for Linguistic Studies. He received Emeritus rank in 1972.

Joos's most influential work as a Germanist was the meticulously edited *Reader* (1951). He was interested in phonetics as early as 1930, and in 1948 produced the first manual of acoustic phonetics that exploited the new technology of the sound spectrograph. His short paper on the historical and phonological implications of English intervocalic apical stops (1942) is still the best statement on this topic. But his strongest influence on descriptive linguistics was exercised through the selection of papers published in 1957 as *Readings in linguistics.* His selection of papers, perceived omissions, and very personal comments on each paper created a furor; the book was a strong seller for many years. In a memoir on the history of the Linguistic Society (published in part in 1986), his personal views and anecdotes are mingled with more conventional historical details.

Joos was a most unconventional man: he seemed interested in everything around him, yet also absorbed in his thoughts to the point of distraction. He was a very effective teacher. Although his irreverence for social and professional conventions (except as data) would frequently and in some cases permanently exasperate his colleagues, he took his students, sophomores and all, very seriously, treating them with courtesy and patience: the *Readings* were prepared for them, above all. His 1972 paper on a single word in *Parzifal* shows something of what his classes were like. I have heard several versions of a quip about him: "If you ask Martin Joos what time it is, he'll tell you how to build a watch." He might well have accepted this as a compliment. And that watch would keep time.

Jordan: Language Situation

E Al-Wer, University of Essex, Colchester, UK

Jordan is predominantly an Arabic-speaking country. It occupies an area of 92 000 km^2 and borders Syria (on the north), Iraq and Saudi Arabia (eastern border), the Gulf of Aqaba (on the south), and Palestine and Israel (western border). Jordan became an independent political entity in 1923, first as an emirate under British protection, then as an independent kingdom, since 1946. Its population in 1946 was no more than half a million; Jordan now has 5.4 million people. In addition to a very high birth rate, the growth in Jordan's population has resulted from the displacement of Palestinians from Israel, the West Bank, the Gaza Strip, and Kuwait (during the Gulf War). The country is also host to hundreds of thousands of workers from Egypt, Sri Lanka, the Philippines, Pakistan, and Iraq (since 1990).

English, the major foreign language, is taught in all state and private schools as a compulsory subject and is used as the medium of instruction in the faculties of science and medicine in higher education. It is also widely used in the business and banking sectors, and as a lingua franca in communications with non-Arab residents. French is considered the second foreign language, and is taught as such in many private schools, but is not ordinarily used outside the classroom. Jordanian Arabic borrows extensively from English and contains a number of borrowings from French.

The most important ethnic and linguistic minority group is Circassian (estimated to be 60 000 people). The Circassian language (a North Caucasian language of the western group) is undergoing a shift in favor of Arabic. The second most important group is the Chechen-Ingush (an estimated 10 000 people); members of this group are generally bilingual in Chechen-Ingush (a North Caucasian language, of the eastern group) and Arabic. The Circassians and the Chechens in Jordan are descendents of the 19th- and 20th-century emigrants from North Caucasia. Their languages are mutually unintelligible (for details on both communities, see Al-Wer, 1999). Another minority language, Armenian, is spoken by 4000 people (see Al-Khatib, 2001). Domari is spoken by some 35 000 people. There is also a small community of Turkomans, speakers of a variety of Turkish (see Moawwad, 1999). Jordan has a national sign language (Arabic acronym, LIU).

Jordanian Arabic is classified into two major dialect groups. Broadly speaking, the eastern and southern dialects are of the Najdi type and have fewer speakers compared to the northern and northwestern dialects, which are classified as (southern) Levantine (see Cleveland, 1963). Within the Levantine group, the most important distinction is between the Haurani type, exemplified by the dialects of the cities of Ajloun (in the north), and Sult (in the northwest), and the Madani (or urban) type. The Madani dialects are very similar to those spoken in the major cities in the region (e.g., Jerusalem, Damascus, and Beirut). The emerging dialect of Amman, the capital city of Jordan, has a predominance of phonological features that are akin to the urban Levantine group (for details, see Al-Wer, 2002).

Jud, Jakob (1882–1952)

S N Dworkin, University of Michigan, Ann Arbor, MI, USA

Jakob Jud spent his entire university teaching career at the University of Zurich, where he studied under H. Morf and L. Gauchat. He also trained under J. Gilliéron and M. Roques in Paris.

Jud specialized in dialect geography and lexical paleontology, stressing the relationship between words and culture. Jud first came to the attention of his fellow Romanists with a series of early papers based on his Habilitationsschrift (*Sprachgeographische Untersuchungen*), which challenged, on the basis of lexical distribution, several etymologies proposed by Wilhelm Meyer-Lübke. Unlike Gilliéron, who limited his purview to French and to the synchronic data available in his own *Atlas linguistique de la France*, Jud viewed the geographic distribution of lexical items from a dynamic and pan-Romance perspective; excellent examples are the word studies in Jud (1925–1926). He examined lexical variation across the ROMANIA to demonstrate how the study of Romance loans in neighboring Germanic and Celtic languages could throw light on the diffusion of Latin lexical items in the late Roman Empire (Jud 1914, 1946). The close connection between lexical variation and culture can be seen in his essays on French, Italian, and Rhaeto-Romance ecclesiastical terminology (reprinted in Jud, 1973). Most of Jud's lexical studies deal with these languages, with occasional incursions into Spanish.

His most important single undertaking was the *Sprach- und Sachatlas Italiens und der Südschweiz* (1928–1940), prepared in collaboration with his friend and Bern colleague Karl Jaberg. From the beginning, Jud had a deep, abiding interest in Rhaeto-Romance language and culture. He wrote a number of studies to demonstrate the linguistic independence of this language group and to combat the claims made in fascist Italy that Rhaeto-Romance was an extension of Northern Italian varieties. As a result of the growing inaccessibility in the thirties of German journals to foreign specialists, Jud cofounded (with Arnald Steiger) the journal *Vox Romanica*, which continues to be the organ of Swiss Romanists. Sixteen representative studies and a complete bibliography of Jud's publications can be found in Jud (1973). Appreciations of his life and work can be found in Steiger (1952) and Kristol (1997).

Judaism

J Neusner, Bard College, Annandale-on-Hudson, NY, USA

The Language of Judaism

Hebrew, an ancient northwest Semitic language, has served as the principal language of Judaism, even after the Jews ceased to speak Hebrew as their everyday language. The Hebrew Scriptures ('Old Testament,' 'written Torah') of ancient Israel were mainly in Hebrew. Brief sections of Ezra and Daniel are in Aramaic. The Scriptures were translated into Greek, Aramaic, and other languages, but in the synagogue were and are declaimed in Hebrew. The great commentaries to Scripture, written by the Rabbinic sages of the first six centuries of the Common Era, were written in Hebrew, and philosophy, poetry, and liturgy favored that language as well. That preference for Hebrew persisted, even though it was explicitly

stated that translation of Scripture into Aramaic was allowed, and the use of the vernacular for various purposes made explicit.

The prophet Zephaniah (3:9) speaks of the future, in which "I (God) will change the speech of the peoples to a pure speech," meaning Hebrew. Called 'lashon haqqodesh,' or Holy Language, the Hebrew language is accorded religious status in Judaism. A community with roots deep in the past, diverse and widely scattered, affirms its coherence through privileging a single language, Hebrew. Hebrew is a way for "identifying one's original religious allegiance" (Aaron, 2000a: 271). "By relating to their language as holy, Jews transformed Hebrew into a kind of ritual object, parallel . . . to the Torah-scroll itself . . . part of a religious system" (Aaron, 2000a: 268–9).

Language of Prayer; Languages of Daily Life

Even though Hebrew enjoyed the status of a religious artifact in Judaism, the languages of the Israelites in the Land of Israel in late antiquity were Aramaic and Greek. Leading Rabbinic sages knew Greek and encouraged some of their disciples to use it (Mishnah-tractate Abodah Zarah 3:4). While it was not the language of daily life, Hebrew enjoyed privileged standing in certain liturgical settings, but by no means throughout. But since not everybody knew Hebrew, provision was made for the recitation of obligatory prayers in any language, and these included the recitation of the creed, the Shema ("Hear O Israel, the Lord our God, the Lord is one") and the presentation of the Prayer ("Eighteen benedictions").

> Mishnah-tractate Sotah 7:1–2
>
> 7:1 A. These are said in any language: (1) the pericope of the accused wife (Num. 5:19–22), and (2) the confession of the tithe (Deut. 26:13–15), and (3) the recital of the Shema, (Deut. 6:4–9), and (4) the Prayer, (5) the oath of testimony, and (6) the oath concerning a bailment.
>
> 7:2 A. And these are said (only) in the Holy Language (Hebrew): (1) the verses of the first fruits (Deut. 26:3–10), (2) the rite of removing the shoe (Deut. 25:7), (3) blessings and curses (Deut. 27:15–26), (4) the blessing of the priests (Num. 6:24–26), (5) the blessing of a high priest (on the Day of Atonement), (6) the pericope of the king (Deut. 17:14–20);
>
> B. (7) the pericope of the heifer whose neck is to be broken (Deut. 21:7f.), and (8) (the message of) the anointed for battle when he speaks to the people (Deut. 20:2–7).

What is limited to Hebrew are few items, mostly involving texts supplied by Scripture, as indicated. Here the key is that the recitation must be verbatim, hence not only a fixed text, as in the Shema and the Prayer, but a set text that Scripture prescribes, in so many words, in Hebrew.

Translations of Scripture into Aramaic (called Targumim) and Greek were enunciated in public worship, but Scripture had to be read, first of all, in Hebrew. The following concerns the public declamation, on Purim, of the scroll of Esther, which had to be read in Hebrew, not in translation:

> Mishnah-tractate Megillah 2:1
>
> A. One who reads the Megillah (scroll of Esther) out of (its literary) sequence has not fulfilled his obligation.
>
> B. (1) If he read it from memory, (2) if he read it in translation into any language, he has not fulfilled his obligation; (3) but one may read it to non-speakers of Hebrew (*le'uzot*) in other languages. (4) And a speaker of another language who heard Ashurit (the text read from a scroll written in Hebrew language and in square script) has fulfilled his obligation.

But that is only one aspect of the matter of public worship and communal rites. When it comes to prayer, Hebrew was not privileged. The Shema, the Credo recited in worship, could be said in any language, so too the formal petitions or The Prayer par excellence were said in the vernacular. But in the history of Judaism from antiquity forward, the use of Hebrew in synagogue worship predominated. Home rites, such the liturgy, Haggadah ('Narrative') recited at the Passover Seder, also were developed principally in Hebrew. Prayer other than in Hebrew, while licit, thus was discouraged: "When one petitions for his needs in Aramaic, the ministering angels do not listen to him, for they do not understand Aramaic" (Neusner, 1995; Bavli Shabbat, 112b).

Aramaic was the everyday language of the Rabbis of the Judaic academies, but they produced in Hebrew the law code, the Mishnah, and its supplement, the Tosefta, and commentaries, the Talmud of the Land of Israel and the Talmud of Babylonia. Their Hebrew differed from that of Scripture. But education in the Hebrew of Scripture and of the Rabbinic writings was integral to the religious nurture of the young (see Neusner, 1987; Sifre to Deuteronomy XLVI:I).

The Role of Language Analysis in the Law of Judaism

The legal literature of Judaism is written in Hebrew and in Aramaic. The law codes, the Mishnah, Tosefta, and related collections, are in Hebrew. The analytical work of commenting upon the law is in Aramaic. By their choice of the very language in which they would express what they wished to say on their own account

they differentiated themselves from their antecedents. When it came to citations from prior, non-scriptural authorities, they used one formation of the Hebrew language, specifically, Middle, or Mishnaic, Hebrew; when it came to the conduct of their own analytical process, they used one formation of the Aramaic language, Eastern or Talmudic Aramaic. They never alluded to authoritative facts, they always cited them in so many words; but the indication of citation – in a writing in which the modern sigla of quotation marks and footnotes were simply unavailable – came to expression in the choice of language. In point of fact, the Talmud of Babylonia or Bavli is in one language, not two, and that language is Aramaic. The infrastructure of the document, its entire repertoire of editorial conventions, and sigla are in Aramaic.

When a saying is assigned to a named authority, the saying may be in Hebrew or in Aramaic, and the same named authority may be given sayings in both languages – even within the same sentence. But the editorial and conceptual infrastructure of the document comes to expression only in Aramaic, and when no name is attached to a statement, that statement is always in Aramaic, unless it forms part of a larger, autonomous Hebrew composition, cited by, or parachuted down into, 'the Talmud.' Rightly have the Talmudic masters in the Yeshiva-world hypostatized the Talmud in such language as, "the Gemara says. . ." because the Talmud speaks in a single voice; forms a unitary discourse, beginning, middle, and end; and constitutes one wholly coherent and cogent document, everywhere asking questions drawn from a single determinate and limited repertoire of intellectual initiatives – and always framing those questions, pursuing those inquiries, in Aramaic.

And yet the Talmud also is full of Hebrew. So we must ask where and why framers of this writing utilize the Hebrew language, and when we may expect to find that they speak – rather, 'the Talmud speaks' – in Aramaic. Specifically, what signal is given, what purpose is served by the bi- or multilingualism of the Talmud, what do we know without further ado, when we are given a composition or a component of a composition in Hebrew, and what is the implicit meaning of making a statement in Aramaic? The answer is that the choice of language signals a taxonomic meaning, and language serves as a medium for the classification of discourse, hence, language serves as a medium of taxonomy. In a writing that utilizes two languages, the choice of one over the other conformed to rules of communication and marked what was said as one type of statement rather than another. If we know which language is used, we also know where we stand in the expression of thought, and the very language in which a statement is made therefore forms part of the method of thought and even the message of discourse of the document.

The Role of Language Analysis in the Theology and Exegesis of Judaism

In reading Scripture, Judaism brought to bear a particular theory of how language works (Aaron, 2005: 400). The Rabbinic exegetes of Scripture distinguished their version of Hebrew from that of Scripture; italics signify Aramaic, plain type, Hebrew:

Bavli Hullin 137b

V.5 A. *When Issi bar Hini left (to go to the Land of Israel), R. Yohanan found him teaching his son (our Mishnah at L, with a variation in the plural suffix of the word sheep): "Five sheep (masculine plural suffix,* rhylym)."

B. *He (Yohanan) said to him, "It was taught (in the Mishnah differently, namely using the plural feminine suffix): 'Sheep (rhylwt).'"*

C. *He (Issi) said to him, "That is the way it is written in scripture,* 'Two hundred sheep (rhylym) (Gen. 32:15).'"

D. *He (Yohanan) said to him,* "The Torah has its own language and the sages have their own language. (You should not confuse the two.)"

Their rules of exegesis corresponded with ordinary speech. Thus the argument from analogy (*gezerah shavah*) is a commonplace. Verses that share the same word choice are asked to clarify the meaning of one another. Various particles of speech serve to signal an inclusive meaning of a given concept. Thus, in Aaron's words (Aaron, 2005: 402), "The rules of common logic that normally govern colloquial discourse are transformed by virtue of the Rabbinic conceptualization of the Torah's language. This transformation results from a distinct theory of word meaning, one that allows for exegetical processes that violate what we would otherwise consider the norms of everyday speech. The upshot is that the text of the Torah bears meanings below its surface. When God revealed his words through Moses his prophet, he provided for layers and layers of meaning.

The traits of the Hebrew language, including its alphabet, yielded theological lessons. "The very letters themselves receive their forms by virtue of divine intent" (Aaron, 2005: 407).

Genesis Rabbah I:X.

1. A. ("In the beginning God created" (Gen. 1:1):) R. Jonah in the name of R. Levi: "Why was the world created with (a word beginning with the letter) B?

B. "Just as (in Hebrew) the letter B is closed (at the back and sides but) open in front, so you have no right to

expound concerning what is above or below, before or afterward."

C. Bar Qappara said, "For ask now of the days past which were before you, since the day that God created man upon the earth" (Deut. 4:32).

D. "Concerning the day *after* which days were created, you may expound, but you may not make an exposition concerning what lies before them"

E. "And from one end of the heaven to the other" (Deut. 4:32).

F. "(Concerning that space) you may conduct an investigation, but you may not conduct an investigation concerning what lies beyond those points."

Aaron explains, "Midrash relies on a concept of meaning that violates the rules of everyday language usage, even as it relies upon them to convey its meanings . . . Midrash becomes a vehicle in ordinary language by which to uncover hidden meanings embedded in the extraordinary language of God's revelation" (Aaron, 2005: 410).

Conclusion

Until the beginning of the 20th century, Hebrew served as the language of synagogue worship and other ritual occasions, study of the Torah or divine revelation, and legal and theological discourse. It was the international language of Judaism, superseding the local languages spoken by Jews. It was comparable in function to Latin in Western Christendom. This ritualization of the language is explained by Aaron in the following language (Aaron, 2000a: 283):

> During the Rabbinic period, despite relatively low levels of Hebrew literacy among common Jews, Hebrew began serving as Judaism's language in ritual contexts. The success of this ritualization of language was part of a conceptualization of language that sought to transcend the common level of semantics we normally ascribe to simple utterances . . . With ritualization, meaning could be found not only in the semantic values of the words read but also in the act of recitation itself . . . The whole Rabbinic enterprise is founded upon a meta-semantics of sorts, one that holds that meaning is at once rooted in the words of Torah but not identical to their common connotations."

Hebrew was and is by no means the only language identified with the Jewish group and with Judaism. Yiddish (based on Hebrew and German), Ladino (based on Hebrew and Spanish), Judeo-Arabic, Judeo-Persian, and other local languages have flourished. But when it came to the creation of the Jewish state, the State of Israel, it was Hebrew that was chosen for renewal, and that became the language of the new and renewed culture of the Jewish people.

Junius (Francisci Filius), Franciscus (1591–1677)

L Kaczmarek, Borgholzhausen, Germany

Franciscus (or Francis) Junius F. F. (called 'filius,' son, to distinguish him from his nephew of the same name) was born on January 29, 1591, in Heidelberg, Germany, the son of the French-born Calvinist theologian François du Jon (Junius the Elder). Gerardus J. Vossius, the renowned humanist who became his brother-in-law, was headmaster of his Latin school and interested him in more advanced studies of the older stages of the Germanic languages. Junius studied the arts and theology (under his uncle, the anti-Remonstrant Gomarus) at

expound concerning what is above or below, before or afterward."

C. Bar Qappara said, "For ask now of the days past which were before you, since the day that God created man upon the earth" (Deut. 4:32).

D. "Concerning the day *after* which days were created, you may expound, but you may not make an exposition concerning what lies before them"

E. "And from one end of the heaven to the other" (Deut. 4:32).

F. "(Concerning that space) you may conduct an investigation, but you may not conduct an investigation concerning what lies beyond those points."

Aaron explains, "Midrash relies on a concept of meaning that violates the rules of everyday language usage, even as it relies upon them to convey its meanings . . . Midrash becomes a vehicle in ordinary language by which to uncover hidden meanings embedded in the extraordinary language of God's revelation" (Aaron, 2005: 410).

Conclusion

Until the beginning of the 20th century, Hebrew served as the language of synagogue worship and other ritual occasions, study of the Torah or divine revelation, and legal and theological discourse. It was the international language of Judaism, superseding the local languages spoken by Jews. It was comparable in function to Latin in Western Christendom. This ritualization of the language is explained by Aaron in the following language (Aaron, 2000a: 283):

> During the Rabbinic period, despite relatively low levels of Hebrew literacy among common Jews, Hebrew began serving as Judaism's language in ritual contexts. The success of this ritualization of language was part of a conceptualization of language that sought to transcend the common level of semantics we normally ascribe to simple utterances . . . With ritualization, meaning could be found not only in the semantic values of the words read but also in the act of recitation itself . . . The whole Rabbinic enterprise is founded upon a meta-semantics of sorts, one that holds that meaning is at once rooted in the words of Torah but not identical to their common connotations."

Hebrew was and is by no means the only language identified with the Jewish group and with Judaism. Yiddish (based on Hebrew and German), Ladino (based on Hebrew and Spanish), Judeo-Arabic, Judeo-Persian, and other local languages have flourished. But when it came to the creation of the Jewish state, the State of Israel, it was Hebrew that was chosen for renewal, and that became the language of the new and renewed culture of the Jewish people.

Junius (Francisci Filius), Franciscus (1591–1677)

L Kaczmarek, Borgholzhausen, Germany

Franciscus (or Francis) Junius F. F. (called 'filius,' son, to distinguish him from his nephew of the same name) was born on January 29, 1591, in Heidelberg, Germany, the son of the French-born Calvinist theologian François du Jon (Junius the Elder). Gerardus J. Vossius, the renowned humanist who became his brother-in-law, was headmaster of his Latin school and interested him in more advanced studies of the older stages of the Germanic languages. Junius studied the arts and theology (under his uncle, the anti-Remonstrant Gomarus) at

Leiden. For a short time, Junius served as a priest in Hillegersberg but then resigned and went to England, where he lived with the Howard family as a tutor, antiquarian, and art historian for more than 20 years, publishing his *De Pictura Veterum* in 1637.

Back in Holland in 1642, he began his second phase (which lasted until his death in Windsor, England, on November 19, 1677), first as an etymologist interested in roots, and later as a lexicographer developing corpora. He also collected and edited medieval manuscripts and old books, which he heavily annotated. Since about 1644, he studied the Old Germanic languages (which he came to accept as a grouping of its own) and planned an etymological dictionary of Dutch, his *Etymologicum Teutonicum*, a project he never realized. In 1647–1648, he studied the Frisian language in Friesland (see article by P. H. Breuker in Bremmer 1998: 129–157).

Returning to England in 1648, Junius advised William Somner, who worked on a *Dictionarium Saxonico–Latino–Anglicum* (1659). From 1651 to 1674, Junius lived in Holland again, editing and commenting Old High German (*Observationes in Willerami*, 1655, repr. 1992) and Old English texts (*Cædmonis monachi paraphrasis poetica*, 1655, repr. 2000). From 1654 he was able to work on the sixth-century *Codex Argenteus* that his nephew Isaac Vossius had received as a present from Sweden. It contains the Gothic translations of parts of the Gospels by Bishop Wulfila (fourth century). This work resulted in Junius's *Gothicum Glossarium* (1665), the first lexicon of Gothic ever.

Other lexicographical work by Junius is contained in the edition of the *Gothic Gospels*, with glossary, he published with Thomas Marshall (1664–1665). His *Etymologicum Anglicanum* was only edited by Edward Lye in 1743. Projected books, partly contained in the more than 120 unpublished manuscripts he bequeathed to the Bodleian Library, Oxford (see article by E. G. Stanley in Bremmer 1998: 159–176), are glossaries on Chaucer, Otfrid, Cædmon, and Ælfric. There are also extant materials and lexicographical transcripts for a Latin–Old English dictionary (MSS Junius 113–116d) and his Old High German glossaries A-P (MSS Junius 116a-e). Later researchers draw heavily on his material (e.g., G. Hickes, *Linguarum veterum septentrionalium thesaurus* [1705], and E. Lye, *Dictionarium Saxonico-et Gothico-Latinum*, ed. O. Manning [2 vols., 1772]). For literature on Junius see Breuker (2000) and esp. Romburgh (2004).

His studies of Old and Middle Frisian, Anglo-Saxon, the Scandinavian languages, Gothic, Frankish, and Old High German earned him an important place in the early development of Old Germanic studies and comparative philology.

Jury Instructions

B Dumas, The University of Tennessee, Knoxville, TN, USA

Although jury trials are not used in all countries, they are used in most ADVERSARIAL or COMMON LAW jurisdictions. Those include Britain (apart from Scotland), continental Europe (including East Europe), the United States, Canada, Australia and New Zealand, as well as many other countries influenced by colonialism by those countries and continents. Trial process in all these jurisdictions includes the giving of instructions by the judge to the jury. In the United States, the instructions are almost always drawn from standard or pattern instructions, previously drafted models produced by bodies of lawyers and judges whose charge is to accurately state the current law. That is not often true in other jurisdictions. Further, the bulk of the research on the comprehensibility of jury instructions has taken place inside the United States. In many countries, jury proceedings are kept secret. Jurors are not allowed to discuss the deliberation process after the trial is concluded. For all these reasons, this article deals almost exclusively with the language of jury instructions used inside the United States. For information about other jury systems, readers may want to consult Vidmar (2000) and such articles as Thaman (1999).

Juries are used in both civil and criminal trials. Legal language in general has been recognized as being difficult for laypersons at least since Mellinkoff (1963) (see also Tiersma, 1999 and updates at his web page). But jury instructions present a special difficulty for jurors. In every jury trial, the trial judge, the expert on law, must instruct jurors, putative experts on fact, on the operative law. The judge must also instruct the jurors in how to apply the law to the evidence in the case. Jurors then must decide on blame or guilt, and the degree thereof, based on the evidence they have heard and the instructions they have received.

It has long been known that jurors do not always understand their instructions, particularly in the United States, where a great deal of research has been carried out by both judicial theorists and social scientists. Jurors may misunderstand the law or may misunderstand how they are to apply the law. Information about juror confusion has come from a number of sources. Case law (opinions) sometimes report the contents of notes sent by jurors to judges during deliberation; case law in some states allows testimony about conversations among jurors during deliberations; and of course, empirical evidence shows clearly that rewritten instructions that provide context, offer synonyms for difficult terms, and shorten sentences and modify grammatical constructions are much better understood than are pattern instructions.

Some lawyers and judges and also some social scientists assumed for a long time that jurors had difficulty understanding their instructions primarily because of the legal terms often used – often either Latin terms or terms of art, legal terms with specialized senses in law. When serious empirical study of juror comprehension by social scientists began (Charrow and Charrow, 1979), however, the findings indicated clearly that grammatical structures, including the structure of complex sentences, were a major source of problems. Although lay jurors are sometimes confused by Latin terms, such as *mens rea* and *res ipsa loquitur*, or legal terms of art, such as *infant* or *foreign corporation*, they are more often confused by specific grammatical structures and sentence complexity. In fact, the exact syntactic and semantic bars to jurors' comprehension of instructions are now well documented by linguists and psycholinguists. Researchers have demonstrated that modifying grammatical structures, simplifying sentence structure and giving additional information about the meanings of terms, particularly abstract terms, assist jurors to comprehend their instructions.

Further, jurors may be uncertain about the meanings of some highly abstract legal terms. One of the most difficult concepts to explain is that of *reasonable doubt*. Although the level of proof required in civil cases is a *preponderance of the evidence*, in a criminal case, it is *proof beyond a reasonable doubt*. The former can be quantified, but the latter cannot (see Tiersma, 1995; Dumas, 2002).

Legal systems have been slow to modify the pattern instructions used in most U.S. jurisdictions, partly because of the importance of precedent in law and partly because of judicial reluctance to relinquish any control over the jurors. Jury instructions are often worded to reflect the language in a statute, particularly in criminal cases (Solan, 2003), or an appellate opinion rather than to communicate a concept effectively to lay jurors. The judicial response to juror questions that reveal uncertainty about the meaning of jury instructions has typically been to respond by simply rereading the relevant portion of the instructions. There is, of course, no evidence that mere repetition of instructions is helpful when jurors report confusion. Indeed, some studies suggest that the typical judicial response to juror questions about

instructions treats the lack of comprehension as though it were a matter of not having heard, rather than not having understood.

History of Jury Instructions

The pattern or uniform jury instructions used in most U.S. jurisdictions represent in most cases an attempt on the part of the drafters to state the law accurately. Accuracy requires constitutional and statutory adequacy. Accuracy does not require comprehensibility by laypersons, and until recently such comprehensibility was not a primary goal of the drafters of pattern instructions.

The pattern instruction movement became influential in the late 1930s, when the judges of the Superior Court of Los Angeles published *The book of approved jury instructions* (generally referred to as the BAJI instructions). Other jurisdictions (Washington, D.C., Florida, Chicago, Nebraska, Colorado, and Utah) developed pattern instructions over the next two decades. Then in the mid-1950s, the Illinois Judicial Conference recommended the drafting of accurate and impartial instructions in order to correct some perceived abuses, and the recommendation was carried out under the supervision of the Illinois Supreme Court. Following that, the highest courts of a number of states followed the lead of Illinois and prepared their own pattern instructions. At this time, almost all U.S. states have pattern instructions, though the extent to which their use is mandated varies (see Nieland, 1979; Kelley and Wendt, 2002).

Pattern instructions were a step forward with respect to consistency and economy of time and effort. As they came into existence, they served as readily available instructions so that individual instructions did not have to be prepared for every legal case. Their weakness is their form; they are written in dense, complex language and are often modeled on appellate opinion language, language written by judges primarily for other judges to read. In general they are designed to be read, not to be heard read aloud. The judicial appeal of mirroring appellate language is that it is unlikely to give rise to a reversal for error. Put simply, jury instructions full of legalese are unlikely to be reversed for error by appellate courts if they use the same language used by those courts.

Pattern instructions can sometimes be modified by agreement of the parties, often as a result of a *charge conference* (sometimes called a *charging conference*), during which the judge meets with counsel for all parties and outlines the instructions. Counsel may request changes, though the judge makes all final decisions.

In recent years, some jurisdictions have taken a close look at problems in jury systems, particularly that of comprehensibility of instructions, and have initiated reform programs designed to increase comprehensibility and generally improve the lot of lay jurors. Some major studies are those by the National Center for State Courts (Munsterman *et al.*, 1997), California (Kelso, 1996), the District of Columbia (Council for Court Excellence, District of Columbia Project, 1998), New York (New York Jury Project, 1994), and Arizona (Dann, 1993). Two jurisdictions, Arizona and California, have made sweeping changes in their jury systems, including revision of instructions. Another jurisdiction, Tennessee, has implemented a number of changes based on the recommendations of a Jury Reform Commission (*Report of the Tennessee Bar Association Commission on Jury Reform,* 1999) and is continuing to consider suggestions (Cohen, 2003).

Similar recommendations have been made in all such studies. Pattern jury instructions present semantic and syntactic difficulties for lay jurors, difficulties that can be alleviated by careful rewriting of instructions. In addition, the methods of delivery of instructions need revision.

Comprehension Problems

The first major empirical study of pattern jury instructions was that of Charrow and Charrow (1979). In their study of 14 standard civil jury instructions (in Maryland), they tested comprehensibility by asking subjects to paraphrase the instructions, tested for understanding of legal concepts, and tested revised instructions. They found that the following grammatical constructions posed serious difficulties for many jurors:

1. Nominalizations
2. *As to* prepositional phrases
3. Unusual positions of phrases (removed from the elements they modify)
4. Deletion of *wh-* constructions and complements
5. Negatives, especially multiple negatives
6. Passives, particularly when used in subordinate clauses
7. Sentence complexity arising from multilayered subordination and embedded noun clauses.

In addition, Charrow and Charrow found that problems were presented by technical vocabulary, especially for abstract concepts such as *reasonable doubt*, and the use of doublets and triplets. Sentence length *per se* did not pose a problem – i.e., the number of words per sentence was not a good indicator of complexity. Revised instructions prepared to eliminate the

problems listed were much more comprehensible to jurors. All their results have been verified in subsequent research by other researchers.

It has been suggested (see Peter Tiersma's professional Web page) that if the mock jurors used in the Charrows' research had actually watched a trial, heard argument, and deliberated among themselves, juror comprehension might have been increased and might even have compensated for inadequate instructions. To test these and other points, Elwork, Sales, and Alfini (1982) reported results of research in which they showed a videotape of a criminal trial to volunteer jurors who served in mock juries. The mock juries watched the videotape, after which they were given either the original jury instructions or rewritten jury instructions. After verdicts were reached, the volunteers were questioned about legal points raised in the instructions. Those who had received the original instructions gave correct answers 40% of the time on average. Those who had received the revised instructions gave correct answers 78% of the time.

Another major study was that of Steele and Thornburg (1988), who, citing Charrow and Charrow (1979), addressed issues of comprehensibility from a judicial point of view, observing that the needed changes in jury instructions will "need to be supported by changes in the law that w[ill] create incentives for lawyers to worry as much about comprehensibility as they do about technical correctness" (p. 108).

Steele and Thornburg also addressed issues of the method of delivery of instructions, suggesting that jurors should be given copies of their instructions to use during deliberations.

It has, of course, been pointed out numerous times (see summaries in Dumas, 2000 and Gibbons, 2002) that the text of jury instructions is not the only factor affecting comprehension. Dumas has summarized delivery issues, taking the position that if the legal system had taken early research on the syntax and semantics of jury instructions totally seriously, they might well have made the suggested changes, but that if nothing else had changed, little improvement in comprehension might have occurred, and judges and lawyers might have concluded that the revisions were relatively unimportant. Methods of delivery and timing of delivery must also be considered (p. 67).

Gibbons has pointed out (drawing on research reported by Lieberman and Sales, among others), "There is ample research to show that linguistic issues are a part, but not all of the problem. There may also be psychological issues in jurors' understanding and acceptance of instruction" (2003: 179).

A forthcoming book (Dumas, 2005) suggests that changes are needed in all the following areas:

- Introductions to instructions (outlines, roadmaps)
- Syntactic complexity
- Semantic complexity
- Abstract concepts
- Timing and delivery
- Methods of delivery of jury instructions
- Instruction in the use of jury instructions.

Additional studies were cited earlier. They continue today. Of great importance are recent changes in California, particularly the approval of revised civil instructions, discussed in detail following.

Reform Efforts

In a sense, the creation of pattern instructions can be said to have begun the reform effort. However, because the wording of pattern instructions is responsible for most of the comprehension problems with jury instructions today, it makes more sense to date reform efforts from 1979, when Charrow and Charrow published their study. Serious efforts have thus continued for 25 years. Given the clear cross-disciplinary consensus about the difficulties of dealing with long, complex sentences and such terms of art as *mitigation* and *reasonable doubt* that has emerged, it is difficult to understand why the legal system has been so slow to make needed improvements to the pattern instructions. It must be attributed to ongoing judicial reluctance to relinquish control over the jurors.

But serious and quite successful efforts at reform have been made in several jurisdictions. Arizona was one of the first jurisdictions to make important and influential changes in the jury system as a whole. Most of the Arizona Committee's 55 recommendations were adopted by the Arizona Supreme Court in 1995; at least one follow-up study has reported positive results. Both the methods and conclusions of the reform commissions that carried out some of the studies are quite similar. In most cases, lawyers, judges, and jurors (the lawyers representing both prosecutors and defense lawyers in criminal cases and both plaintiffs' lawyers and defense lawyers in civil cases) studied the existing jury system and scholarly evaluations of that system, then made specific recommendations for change. Each recommended changes in many facets of jury procedures, though none has recommended the kinds of changes that will alter the traditional character of the American jury system.

The history of the Tennessee Bar Association is representative. It was created as a result of a presentation at an Annual Dinner of the National Center for State Courts at the Supreme Court Building in

Washington, D.C., in late 1997. TBA president-elect Pam Reeves heard Judge Michael Dann of Arizona describe the Arizona effort and similar jury reform projects in other states. After consulting with members of the Tennessee Supreme Court, Ms Reeves appointed the Tennessee Jury Reform Commission to review existing Tennessee jury practices, recent social science research, and developments in other jurisdictions and to make appropriate recommendations.

Each of three committees (jury administration and management, pretrial management and postverdict issues; jury selection and trial procedures; jury instructions) made recommendations, which were submitted to the entire Commission for discussion and approval. The conclusions of the Commission are contained in the May 1999 *Report of the Tennessee Bar Association Commission on Jury Reform* (hereafter *Report*). (See Cohen and Cohen, 2003 for a recent review of enactment of the recommendations.)

Reforms in New York and the District of Columbia have also been important. However, ongoing reform efforts in California deserve special attention. In July of 2003, the California Judicial Council unanimously approved approximately 800 new civil jury instructions and special verdict forms for use in California trial courts. The texts of the new instructions and verdict forms had been in preparation since 1997, when the Judicial Council created the Task Force on Jury Instructions in response to the 1996 statement by the Blue Ribbon Commission on Jury System Improvement to the effect that jury instructions would be more useful if they were stated in more understandable language. Though the new instructions are not required, their use is encouraged. (Details of the revision and comparisons of the new instructions with the older BAJI instructions are available at the website of the California Judicial Council. Some details are also available at Peter Tiersma's website.)

The Judicial Council also approved the preparation of new criminal instructions; they are expected to be submitted for approval by 2006.

Conclusion

Pattern instructions are not well understood by the average juror. The complexity of pattern instructions is multifaceted. Instructions are quite complex syntactically, and they should be rewritten so that they are less complex syntactically so as to be comprehensible to nonlawyers with limited formal education. But although it is true that revision of problematic linguistic constructions improves comprehensibility, that alone does not appear to be completely adequate.

In addition, there is evidence that a higher level of comprehension can be achieved by (1) providing roadmaps early in the instructions, (2) avoiding the use of arcane vocabulary items whenever possible, and (3) clarifying the meanings of difficult abstract concepts by providing concrete, perhaps narrative, examples.

All these steps are necessary both because of the inherent complexity of pattern instructions and perhaps also because of the nature of the Anglo-American legal process, which operates by means of a reasoning pattern in which a case is tried, a proposition descriptive of the case is made into a rule of law, and the proposition becomes a precedent to be applied to future similar situations. Future situations arise, some of which may eventually be sufficiently different from the original situation to prompt a rethinking of the original rule and perhaps a revision of it. It is thus essential that jurists be able to discern similarities and differences among objects and situations.

Roadmaps

During their time in the courtroom, jurors resemble nothing so much as students taking a course – or several courses simultaneously – in a new and arcane subject. They must absorb new information, learn new procedures, and digest and use new standards quickly and with no time for reading, reviewing, or consulting with others. They may, for example, need to learn a great deal about constitutional law, criminal procedure, medical standards, and human psychology all within a few days. In addition, they must judge the credibility of witnesses, often expert, who contradict each other's testimony. They need all the help they can get. One way to assist them in the instructions is to tell them exactly what they are going to hear before they hear all the details. A roadmap, a list or diagram telling jurors where they are headed and by what route that can expect to arrive there, can provide an outline of jury instructions.

Syntactic and Semantic Complexity

As noted earlier, pattern instructions often closely track statutory or appellate opinion language. Appellate opinions are specifically directed to judges (i.e., legal professionals trained in law and accustomed to using legal discourse on a daily basis). Further, they are designed to be read by judges, not listened to. They are necessarily characterized by lengthy sentences containing many clauses, a great deal of subordination, and arcane vocabulary items, including legal terminology and mysterious doublets. All those characteristics present comprehension problems.

Difficult Abstract Concepts

Many legal concepts are difficult to define; *reasonable doubt* is one such concept. Others are

proximate cause, defective and unreasonably dangerous, and *present cash value*. One way of explaining such concepts to lay jurors is to give examples or brief narratives. One possible corrective is paraphrasing. Another corrective involves the addition of an example. Some issues may require the addition of both positive and negative examples. Finally, some issues may suggest a need for both paraphrase and examples. Here is such an example making use of some of these strategies:

Some of these legal concepts or principles can be difficult for laypersons to understand. I hope this example will illustrate for you a practical example of proximate cause: it is negligence for a driver to drive a car that has bad, or slick, tires. If that automobile with bad tires slams into the rear of a car because the driver could not stop due to a combination of slick tires and wet pavement, then the negligence of the driver in driving with bad tires would be a proximate cause of the accident.

But it is possible for a person to be negligent without that negligence being a proximate cause of the accident. If the driver of that car with bad tires is stopped for a red light and is struck in the rear by another car, obviously the bad tires had nothing to do with the accident. In other words, the driver's negligence in driving a car with bad tires was not a *proximate cause* of that accident.

To find a party to be 'at fault,' you must find that party was negligent *and* that the negligence was a proximate cause of the injury or damage for which a claim was made. You must then determine the percentage of fault of each party whom you have determined is at fault.

Timing of the Delivery of the Instructions

It is traditional in most jurisdictions to provide most jury instructions, particularly those involving substantive law, after all the evidence has been presented and just before deliberation. This may invite jurors to form opinions about the proper outcome of the case well before they are instructed in the applicable law. It is widely believed that the single most important factor in the determination of juror attitude is juror reaction to the opening statements delivered at the very beginning of the case, when lawyers outline their theories of the case and prepare jurors for the evidence they will hear. Thus pretrial instruction in substantive law might improve jury performance.

Delivery of the Instructions

Whatever the exact manner of delivery, instructions prepared to be read should not be delivered orally in a rapid monotone. Jury instructions are often lengthy and complex. A number of changes in the delivery process could help to make the communication more effective. Judges could provide summaries as well as roadmaps (discussed earlier); they could make use of multimedia formats, particularly charts, decision trees, or simple 'bullet' summaries; and they could be careful to maintain eye contact with jurors and in general pay full attention to the legitimacy, dignity, and humanity of the jurors and their role.

Current research tells us that legal jargon is neither the sole nor a major source of incomprehensibility in jury instructions, though it can present special problems (*proximate cause*, *stipulate*, *mens rea*, *beyond a reasonable doubt*, etc.). The textual problem is overwhelmingly sentence structure, also difficult grammatical constructions such as nominalizations, vague or unusual prepositional phrases, doublets, especially of legal terms, and passive constructions, particularly in subordinate clauses. Other issues include presuppositions underlying jury instructions in opposition to the presuppositions underlying attorney strategies, the nature of the task, and the highly abstract nature of the instructions. Remedies are available: simplify sentence structure, paraphrase difficult concepts, add examples and narratives to the pattern instructions, answer jurors' questions, and give jurors written copies of their instructions.

Reform must acknowledge frankly that the jury's role as finder of fact has to compete both with requirements of legal procedure, particularly those implicating constitutional issues, and also with the judicial perception that the jury must be highly constrained and controlled. In the courtroom, the judge is the domain expert on law and procedure. Lip service is paid to the idea that the jury is the trier of fact and is, therefore, a domain expert in its own right. But jurors are not treated as experts. If they were, they would have greater freedom in certain areas, would be able to take notes and ask questions, and would be provided instructions that are not so arcane and convoluted as to be incomprehensible to most people.

K

Kalkutungu

B J Blake, La Trobe University, Bundoora, Australia

Kalkutungu (also Kalkatungu (Kalkatung) and Kalkadoon) is a Pama-Nyungan language, and, like many other Australian languages, it is largely agglutinative, although with a good deal of irregular bound forms. Nouns are inflected for case and verbs for tense, aspect, mood, and modality. Word order is controlled by discourse principles with few grammatical constraints.

Kalkutungu has a typical phoneme inventory with two laminal series of stops, nasals, and laterals. In company with the Arandic languages to the west, at some stage in the past Kalkutungu underwent a change involving the loss of initial consonants and in some instances initial syllables. This has resulted in words with initial *a*, such as *arnka* 'to be ill' (cf. Yalarnnga *yarnka*) and words with initial homorganic nasal-stop clusters such as *mpaya* 'you two' (cf. Yalarnnga *nhumpala*).

The core case marking opposes an ergative case for the agent of a transitive verb (A) and an unmarked absolutive (alternatively nominative) for an intransitive subject (S) and object (O). The ergative-absolutive distinction applies to free pronouns as well as to nouns, but there is a system of clitic pronouns that oppose a subject set covering S and A functions to an object set. An odd feature of Kalkutungu is that although these clitics are obligatory with auxiliaries and in the perfect and imperfective aspects, they are otherwise optional and used rather sparingly. The following examples illustrate the core case marking and clitic pronouns. Note in (2) that the ergative expresses the instrument used to perform an action as well as the agent.

(1) marapayi ingka-nha-na ntiya-piyangu tawun-kunha
woman.ABS go-PT-3PL.SUBJ hill-ABL town-ALL
'the women went from the hill to the town'

(2) marapayi-thu ngayi kanimayi-nha-ngi-na rupu-ngku
woman-ERG me.ABS tie-PT-1SING.OBJ-3PL.SUBJ rope-ERG
'the women tied me up with rope'

There is a derived two-place intransitive construction, the antipassive, in which the subject appears in the absolutive and the object is demoted to the dative. In independent clauses, this construction is used to signal reduced semantic transitivity. It is used, for instance, to indicate a generic object as in (3b) rather than a specific object as in (3a), and it is obligatory in the imperfective.

(3a) marapai-thu rumpa-mi ithirr matyamirla-thu
woman-ERG grind-FU seed.ABS grindstone-ERG
'the woman will grind the seed with the grindstone'

(3b) marapai rumpa-yi-mi ithirr-ku matyamirla-thu
woman.ABS grind-AP-FU seed-DAT grindstone-ERG
'the woman will grind seed with the grindstone'

In dependent clauses, the antipassive is used to signal co-reference between the agent of the dependent clause and the S or O of the governing clause. In (4), (5), and (6), we have a type of subordinate clause used to express purpose adjuncts and complements to directive verbs. These are characterized by a purpose auxiliary, which hosts clitic pronouns. In (4), the agent of the purpose clause is co-referent with the S of the governing clause so the purpose clause appears in the antipassive, as is evident from the marking on the verb and the dative marking for the patient. In (5), the agent of the subordinate clause is co-referent with the O of the governing clause, so the antipassive is used. In (6), however, the agent of the purpose clause is coreferent with the allative-marked *mangarnaan-kunha* 'to the doctor', so no antipassive is used.

(4) ngayi ingka-nha nha-wu thuwarr-ku
I.ABS go-PT this-DAT snake-DAT
lhaa ngulurrma-yi
PURP.1SING.SUBJ catch-AP
'I went to catch the snake'

(5) nga-thu tjaa pati-nha thuku-wu
I-ERG this.ABS tell-PT dog-DAT
kuntu a-yi ngayima-yi
not PURP-3SING.SUBJ chase-AP
'I told this one not to chase the dog'

(6) nhaa nga-thu unpiyi nga-tji nhawurr
this.ABS I-ERG take I-DAT child.ABS
mangarnaan-kunha a-yi puthurr-puni
doctor-ALL PURP-3SING.SU good-make
'I took my child to the doctor for him/her to cure her'

A feature that Kalkutungu has in common with a number of other Australian languages is insubordination, whereby a subordinate clause becomes independent. Sentence (7a) provides an example; compare it with (4), (5), and (6). Essentially, a verb such as *ingka* in (4) is redundant and over time such verbs have been dropped in some circumstances to yield a construction in which the erstwhile dependent clause is independent. Witness the ergative on the agent in (7a), compared to the absolutive in (4). This construction, in which clitic pronouns are obligatory, makes an interesting comparison with (7b), in which the future tense is used and no clitics.

(7a) nyin-ti a-ngi lha?
you-ERG PURP-1SING.OBJ hit
'are you going to hit me?'

(7b) nhakaakuwa nyin-ti ngayi lhami?
why you-ERG me.ABS hit-FU
'why are you going to hit me?'

Kalkutungu has two applicative constructions. In one, a dative can be promoted to object. If there is a patient object, this is retained, so there is a double object construction. In sentence of (8a), the beneficiary is expressed in the dative. In (8b), the beneficiary is now O and is expressed by an object clitic.

(8a) utjan nga-tji intji-ya
firewood I-DAT chop-IMP
'chop some wood for me'

(8b) utjan intji-tjami-ya-ngi
firewood chop-APPL-IMP-1SING.OBJ
'chop me some wood'

In the other applicative, an instrumental or locative can be promoted. If there is a patient object, it is demoted to the dative. The principal function of this construction is to provide for the anaphoric deletion of the instrumental or locative in purpose or other subordinate clauses. Example (9) is typical. The knife is understood to be the instrument in the purpose clause, but it is covert. The patient is demoted to the dative. Note this demotion is not in response to coreference between the agent of the purpose clause and S or O, as in (4) and (5). Note too that the same marker *-nti* functions as a causative and applicative.

(9) kankari iti-nti-ya ati-ntji
knife. ABS return-CAUS-IMP meat-DAT
lhaa pintji-nti
PURP-1SING. SUBJ cut-AP
'bring the knife so I can cut the meat with it'

The final example is another sample of the instrumental applicative in which the instrument *utjula* 'net' has been promoted to O, pushing the patient *wakarri* 'fish' into the dative. It serves to illustrate two common principles of discourse. First, it is common to represent a nominal with a pronoun or other generic expression early in the clause with a more specific noun later. In (10), *nhaa* 'this' anticipates *utjula* 'net'. Second, the focus is normally placed first in the clause, in this instance *yawun* 'big'.

(10) yawun nhaa nga-thu utjula
big.ABS this.ABS I-ERG net.ABS
wakarri-yi ngurlurr-manti
fish-DAT catch-AP
'I use a big net to catch fish with'

Kamei, Takashi (b.1912)

T Maruyama, Nanzan University, Nagoya, Japan

Born in Tokyo in 1912, Takashi Kamei graduated from the department of Japanese language and literature of the University of Tokyo in 1935, thereafter spending most of his career teaching linguistics at Hitotsubashi University in Tokyo. He also conducted academic researches and gave lectures at Cambridge University, Freie Universität Berlin from 1950 to 1953, and at the University of Arizona in 1975. He was also invited to give lectures on linguistics at various universities in Japan, including the University of Tokyo, Keio University, and International Christian University.

Most of Kamei's works are unknown to the academic world outside of Japan, mainly because most of them are written in Japanese. Some exceptions are 'A Saussurian mystery' (1982) and others listed below, but to some western scholars they might seem very complicated or tantalizing. Even Japanese scholars find it rather difficult to grasp what he really means owing to his unique writing style.

For Kamei, the historical study of language should not exist to compose and support the theoretical basis of linguistics, nor should it merely be the search for examples suited to establish such theories. It must be the pursuit of the development of a given language in its entirety, and in fact has that nature as its destiny. Expressing this from a negative point of view, the history of language can be nothing other than the history of a certain concrete individual language. From the point of view of comparative linguistics, French is one form of Neolatin. However, French is no language other than French and therefore is referred to as an individual subject, i.e., French, and by the same token it must not be considered as Latin. Metaphorically speaking, the moment Latin ceased to exist, French sprang to life. The interpretation of this kind of linguistic history cannot be made only considering a given language as a single code system. The work of the linguistic historian is therefore to take the detailed results of researchers in the field of diachronic linguistics and bring them once more correctly within the envelope of history.

In his own way, Kamei was comparable to Hugo Schuchardt in the sense that he always sat on the opposition benches vis-à-vis the mainstream of rationalism of linguistics of the 20th century, just like Schuchardt was always against the Neogrammarian way of thinking in the 19th century.

Kamei was one of the chief editors of *The Sanseido encyclopaedia of linguistics* (6 vols), published from 1988 to 1996 in Japan. It contains descriptions of more than 3500 different languages of the world and about 1500 important terminologies of linguistics. He also made a huge contribution to the understanding of the *seidaku* concept that had confronted scholars of Japanese for such a long time.

Kannada

S N Sridhar

This article is reproduced from the previous edition, volume 4, pp. 1833–1834, © 1994, Elsevier Ltd.

Kannada (formerly referred to sometimes as 'Kanarese' or 'Canarese') is a South Dravidian language spoken by about 28 million people primarily in the state of Karnataka, South India, where it is the official language. It is also spoken in the neighboring states of Tamil Nadu, Andhra Pradesh, Kerala, and Maharashtra.

History

Kannada is written in a variety of the 'alpha-syllabic' Brahmi system. The earliest written record, the Halmidi inscription (ca. 450 A.D.), already shows the influence of Sanskrit. The history of the language is conventionally divided into three periods, Old Kannada (up to ca. the thirteenth century A.D.), Middle Kannada (up to ca. the nineteenth century), and Modern Kannada (the nineteenth century onward).

Literary and Grammatical Tradition

Kannada has a world-class literary tradition, but few works have been translated. It also has a rich grammatical tradition. The first extant literary work, Nagavarma's *Kavirajamarga* (ninth century), is a treatise on poetics and includes the earliest grammar of Kannada. Kesiraja's *Śabdamaṇidarpana* (1260) is the classic grammar of Old Kannada. The other major grammar is Bhattakalanka's *Karna:taka Śabda:nuśa:sana* (1604), written in Sanskrit. Modern descriptions include Kittel (1903), Spencer (1950), Bright (1958), Schiffman (1983), and Sridhar (1989). Srikanthaiah (1960) and Bhat (1978) include other important descriptions in Kannada.

Variation

Three major regional varieties are recognized: the dialect of the former and present capitals – the Mysore/Bangalore Kannada, the Dharwar (northern) Kannada, and the Mangalore (coastal) Kannada. The Brahmin variety of Mysore Bangalore forms the basis of the standard language. It retains aspirated consonants and consonant cluster combinations in Sanskrit-derived words (which occur with high frequency in this variety). There are other caste varieties, which differ in phonology, morphology, syntax, and the lexicon. Kannada is a diglossic language.

Kannada is interesting from the point of view of historical sociolinguistics because of the millennium-old controversy between the elitists and populists on the one hand and the purists and the pragmatists on the other concerning the proper literary style – a debate that continues to this day.

Structure

Kannada morphology is agglutinative, suffixing, and quite regular. Nouns are marked by cases, postpositions, number, and occasionally gender. Verbs indicate tense, aspect, and agreement in number, person, and gender. Negation is expressed as main verb and as a suffix. Word order is subject–object–verb. The verb normally (but not always) ends the sentence. Modifiers (e.g., adjectives, adverbs, and subordinate clauses) precede their heads; auxiliaries follow main verbs. Compounding is very common in nouns and verbs. Normally, only one finite verb occurs per sentence: the syntax relies heavily on participles, gerunds, and infinitives. A number of these points are illustrated in the following sentence:

ni:nu	*nenne*	*meccida*	*a:*	*mu:ru*	*puṭṭa*
you	yesterday	admired	those	three	little

makkaḷu	*a:ṭa*	*a:ḍi*
children	game	play – past participle

daṇidu	*waḷamaneyalli*	*nidde*
tire – past participle	inside room – locative	sleep

ho:gidda:re.
go – past participle – continuous – 3 (human) plural
'Those three little children whom you admired yesterday have gone to sleep after playing and getting tired.'

Importance of Language Contact

Kannada has successfully assimilated an enormous amount of Sanskrit, Prakrit, Perso–Arabic, New Indo–Aryan, and more recently, English elements. This influence is manifested in the rather substantial stock of loan words, the productive use of Sanskrit derivational morphology, code-mixing, and calquing, which have been the preferred strategies for modernization throughout its history. This openness to borrowing sharply distinguishes Kannada from its sister language, Tamil.

Kannada and Linguistic Theory

Evidence from Kannada has played an influential role in several areas of modern linguistic inquiry. These include the status of grammatical relations, especially

nonnominative subjects, in syntactic theory; processes of syntactic and morphological convergence; morphological levels in derivation; caste dialects; and syntactic and psycholinguistic models of bilingual code-switching, among others.

Kant, Immanuel (1724–1804)

K Willems, University of Ghent, Ghent, Belgium

Kant was born in Königsberg (now called Kaliningrad and a part of Russia), at the time the administrative center of East Prussia. In 1740 he entered the university of his native city to study theology, philosophy, physics, and mathematics. After receiving his doctorate in 1755, he became a *Privatdozent* and earned his living mainly as a private tutor. He never left the area of Königsberg during his entire life. In 1770 he was finally appointed professor of logic and metaphysics at the university of Königsberg after refusing several offers from other universities since 1764. He held his position until 1796, serving as rector of the university in 1786 and 1788.

Kant has often been ranked among the most influential thinkers of all time, on a par with Plato, Aristotle, St. Thomas, Spinoza, Leibniz, Hegel, Nietzsche, and others. His 'transcendental philosophy' has had a long-lasting impact on the history of philosophy and of Western thought in general. It is considered a groundbreaking epistemological framework for assessing the aims, methods, and limits of human knowledge, including moral and aesthetic judgments. Kant's fame is based mainly on his three major works, his so-called *Critiques*, viz., the *Critique of pure reason* (1781, second revised edition 1787), the *Critique of practical reason* (1788), and the *Critique of judgment* (1790). Apart from these books, however, Kant wrote a great number of treatises on a variety of subjects, including natural history, theology, religion, and law.

Kant's philosophy marks the beginning of 'idealism' and is the single most influential synthesis of rationalist and Enlightenment thought on the one hand and empiricist considerations (i.e., a realistic stance) on the other. According to Kant, thinking (understanding) and perceiving are two distinct faculties of the mind, which are related in a complex way. He believed that everything human beings can know about the external world goes back to mental acts in which data are perceived or experienced according to rules and forms of understanding imposed on the data by the mind itself. For Kant, both the data and the rules and forms of understanding are real, but the mind must impose its own constraints on the data for experience to be possible. Although essential component parts of human knowledge are not derived from experience (on this issue Kant is in opposition to the philosophy of David Hume), they are ultimately inconceivable without at least presuming the possibility of their being applied to data in experience. For example, assessing a causal relation between two events in the world means, according to Kant, that causality is projected by the mind onto the events and cannot be found in the latter as such, but at the same time causality is nothing without real-world events to which it can be applied. Thus the world we experience is not simply a product of our minds; rather, our knowledge is confined to

nonnominative subjects, in syntactic theory; processes of syntactic and morphological convergence; morphological levels in derivation; caste dialects; and syntactic and psycholinguistic models of bilingual code-switching, among others.

Kant, Immanuel (1724–1804)

K Willems, University of Ghent, Ghent, Belgium

Kant was born in Königsberg (now called Kaliningrad and a part of Russia), at the time the administrative center of East Prussia. In 1740 he entered the university of his native city to study theology, philosophy, physics, and mathematics. After receiving his doctorate in 1755, he became a *Privatdozent* and earned his living mainly as a private tutor. He never left the area of Königsberg during his entire life. In 1770 he was finally appointed professor of logic and metaphysics at the university of Königsberg after refusing several offers from other universities since 1764. He held his position until 1796, serving as rector of the university in 1786 and 1788.

Kant has often been ranked among the most influential thinkers of all time, on a par with Plato, Aristotle, St. Thomas, Spinoza, Leibniz, Hegel, Nietzsche, and others. His ‘transcendental philosophy’ has had a long-lasting impact on the history of philosophy and of Western thought in general. It is considered a groundbreaking epistemological framework for assessing the aims, methods, and limits of human knowledge, including moral and aesthetic judgments. Kant’s fame is based mainly on his three major works, his so-called *Critiques*, viz., the *Critique of pure reason* (1781, second revised edition 1787), the *Critique of practical reason* (1788), and the *Critique of judgment* (1790). Apart from these books, however, Kant wrote a great number of treatises on a variety of subjects, including natural history, theology, religion, and law.

Kant’s philosophy marks the beginning of ‘idealism’ and is the single most influential synthesis of rationalist and Enlightenment thought on the one hand and empiricist considerations (i.e., a realistic stance) on the other. According to Kant, thinking (understanding) and perceiving are two distinct faculties of the mind, which are related in a complex way. He believed that everything human beings can know about the external world goes back to mental acts in which data are perceived or experienced according to rules and forms of understanding imposed on the data by the mind itself. For Kant, both the data and the rules and forms of understanding are real, but the mind must impose its own constraints on the data for experience to be possible. Although essential component parts of human knowledge are not derived from experience (on this issue Kant is in opposition to the philosophy of David Hume), they are ultimately inconceivable without at least presuming the possibility of their being applied to data in experience. For example, assessing a causal relation between two events in the world means, according to Kant, that causality is projected by the mind onto the events and cannot be found in the latter as such, but at the same time causality is nothing without real-world events to which it can be applied. Thus the world we experience is not simply a product of our minds; rather, our knowledge is confined to

what we can conceive in the first place (the 'phenomena'). On the other hand, we also have to presuppose a world in its own right that is wholly external to us and consists of things as they are in themselves (called 'noumena' or *Dinge an sich* by Kant), about which we can know nothing.

Although he presupposes semiotic functions for language throughout his work, Kant does not explicitly address language for its own sake in his writings, apart from a few passages on language in the *Critiques* and in sections 38–39 of his 1798 treatise on *Anthropology.* The fact that Kant paid so little attention to language in his work was criticized severely by some of his contemporaries, in particular his former student Johann Gottfried Herder (the author of one of the most famous essays on *The origin of language*, 1772). Interestingly, Kant never found it necessary to respond to this criticism. However, Kant's philosophy eventually proved important historically for both the philosophy of language and the epistemology of linguistics (*see* **Humboldt, Wilhelm von (1767–1835)**). Well known in this regard is Kant's new list of 'categories' (*see* **Aristotle and Linguistics**). These categories are defined as "pure concepts of understanding." According to Kant, they are indispensable to experience and common sense as well as to scientific knowledge. Kant proposes a list of 12 categories, which he subdivides into four classes (quantity, quality, relation, and modality); they include basic concepts of reasoning, such as unity, totality, negation, causality, possibility, necessity, etc. Like the Aristotelian categorical concepts, the Kantian categories have a strong bearing on linguistic forms: not only do they correspond to concepts inevitably couched in words and phrases in Kant's philosophical system; they also show that language and reason mutually presuppose each other. (Observe that the four Gricean conversational maxims of quantity, quality, relation, and manner refer, albeit in a loose sense, to Kant's system of categories. (*see* **Grice, Herbert Paul (1913–1988)**.) Finally, Kant's famous logical distinction between 'analytic' and 'synthetic' judgments is also intimately linked to the linguistic form of propositions. Whereas analytic propositions add nothing to the concepts one already has (and therefore cannot be denied), synthetic propositions can be achieved only by appealing to something outside them, i.e., experience or intuition, thus supplying new information, which is in principle falsifiable (*see* **Quine, Willard van Orman (1908–2000)**).

Kanuri

G J Dimmendaal, University of Cologne, Cologne, Germany

One of the earliest documents on an African language, a short vocabulary dating back to the 17th century, involves data from Kanuri, also known as Yerwa, or Bornu; the name 'Beriberi' is considered to be derogatory by Kanuri speakers. Kanuri is a major language in terms of the number of speakers; estimates for Nigeria range between three and four million, whereas in neighboring countries like Cameroon, Chad, and Niger, there may be around half a million speakers. Kanuri forms a dialect cluster with Kanembu, which is spoken by a distinct ethnic

what we can conceive in the first place (the 'phenomena'). On the other hand, we also have to presuppose a world in its own right that is wholly external to us and consists of things as they are in themselves (called 'noumena' or *Dinge an sich* by Kant), about which we can know nothing.

Although he presupposes semiotic functions for language throughout his work, Kant does not explicitly address language for its own sake in his writings, apart from a few passages on language in the *Critiques* and in sections 38–39 of his 1798 treatise on *Anthropology.* The fact that Kant paid so little attention to language in his work was criticized severely by some of his contemporaries, in particular his former student Johann Gottfried Herder (the author of one of the most famous essays on *The origin of language*, 1772). Interestingly, Kant never found it necessary to respond to this criticism. However, Kant's philosophy eventually proved important historically for both the philosophy of language and the epistemology of linguistics (*see* **Humboldt, Wilhelm von (1767–1835)**). Well known in this regard is Kant's new list of 'categories' (*see* **Aristotle and Linguistics**). These categories are defined as "pure concepts of understanding." According to Kant, they are indispensable to experience and common sense as well as to scientific knowledge. Kant proposes a list of 12 categories, which he subdivides into four classes (quantity, quality, relation, and modality); they include basic concepts of reasoning, such as unity, totality, negation, causality, possibility, necessity, etc. Like the Aristotelian categorical concepts, the Kantian categories have a strong bearing on linguistic forms: not only do they correspond to concepts inevitably couched in words and phrases in Kant's philosophical system; they also show that language and reason mutually presuppose each other. (Observe that the four Gricean conversational maxims of quantity, quality, relation, and manner refer, albeit in a loose sense, to Kant's system of categories. (*see* **Grice, Herbert Paul (1913–1988)**.) Finally, Kant's famous logical distinction between 'analytic' and 'synthetic' judgments is also intimately linked to the linguistic form of propositions. Whereas analytic propositions add nothing to the concepts one already has (and therefore cannot be denied), synthetic propositions can be achieved only by appealing to something outside them, i.e., experience or intuition, thus supplying new information, which is in principle falsifiable (*see* **Quine, Willard van Orman (1908–2000)**).

Kanuri

G J Dimmendaal, University of Cologne, Cologne, Germany

One of the earliest documents on an African language, a short vocabulary dating back to the 17th century, involves data from Kanuri, also known as Yerwa, or Bornu; the name 'Beriberi' is considered to be derogatory by Kanuri speakers. Kanuri is a major language in terms of the number of speakers; estimates for Nigeria range between three and four million, whereas in neighboring countries like Cameroon, Chad, and Niger, there may be around half a million speakers. Kanuri forms a dialect cluster with Kanembu, which is spoken by a distinct ethnic

group mainly in Chad. Kanuri-Kanembu is part of the Saharan family, a well-defined subgroup within the Nilo-Saharan phylum.

Kanuri was intimately linked with the Kanem-Borno empire for almost 1000 years. Its role as the *lingua franca* of northern Nigeria was reduced in favor of Hausa during colonial times. Parallel to Hausa, a modified Arabic script known as Ajami was used in Kanuri for several centuries. The orthography based on Roman script and developed during the British colonial period was standardized in 1974. Today, Kanuri is used in mother-tongue education as well as on the radio and in television in Nigeria. It is also taught at university level, e.g., at the University of Maiduguri (Nigeria).

One of the earliest detailed analyses of Kanuri is Lukas (1937), who had already showed that Kanuri has two distinctive tone levels, low and high, as in *kànúrì* ('Kanuri person') or *kànùrí* ('Kanuri language'). These register tones may also be combined to build complex tones; the so-called 'mid' tone established by Lukas (1937: 3) represents a downstep high tone, i.e., a conditioned variant of the high tone. As further shown in Lukas' pioneering study, as well as in more recent analyses by Hutchison (1981), and by Cyffer and Geider (1997), Kanuri also has an intricate system of consonant alternation, resulting in complex morphophonemic alternations.

One interesting typological property of Kanuri is the relatively small number of verbs. More than 95% of the predicative structures are formed by a combination of the light verb *n* ('say, think') and some complement (for example: *le+n* ('go')). This latter strategy is common in a range of Nilo-Saharan languages stretching from Kanuri in the Lake Chad region to Nara in Eritrea (*see* **Nilo-Saharan Languages**). Both complex predicates of this type and basic verbs are inflected for subject, tense-aspect-mood, as well as object (in the case of first and second person). Derivational argument modulation (more specifically, neutro-passive, causative, applicative marking) and pluractional marking is also expressed in the verbal complex.

Kanuri is head-final at the clausal level, involving verb-final structures, preverbal complementation, and the use of postpositions, but nominal modifiers follow the head noun. From a historical-comparative point of view, Kanuri grammar appears to be characteristic for the Saharan group within Nilo-Saharan. Interestingly, however, the lexical structure of Saharan languages appears to be less stable, as argued by Cyffer (2000).

Kapampangan

H Kitano, Aichi University of Education, Aichi, Japan

Kapampangan (Pampangan) is spoken mainly in Pampanga Province and in parts of Tarlac, Nueva Ecija, Bulacan, and Bataan provinces of Luzon, the Philippines. It is one of the largest languages in the Philippines. The number of its speakers is estimated as 1 897 378 (1990 census).

Phonology

Kapampangan has the consonants [p, b, t, d, k, g, ʔ, s, tʃ, ʤ, m, n, ŋ, l, r, w, y] and vowels [i, e, a, ø, u].

Overview of Kapampangan Grammar

Word Order

Like other Philippine languages, Kapampangan is a predicate-initial language. Clitic pronouns and clitic adverbs usually occupy the second position of a clause, and clitic pronouns are almost always obligatory, even when their coreferent noun phrases are present.

(1) Masakit-ya ing lalaki
sick-ABS.3SG DET.ABS.SG man
'the man is sick'

Case Marking

Kapampangan has three cases: topic, genitive (or nontopic), and oblique. Since Kapampangan exhibits

group mainly in Chad. Kanuri-Kanembu is part of the Saharan family, a well-defined subgroup within the Nilo-Saharan phylum.

Kanuri was intimately linked with the Kanem-Borno empire for almost 1000 years. Its role as the *lingua franca* of northern Nigeria was reduced in favor of Hausa during colonial times. Parallel to Hausa, a modified Arabic script known as Ajami was used in Kanuri for several centuries. The orthography based on Roman script and developed during the British colonial period was standardized in 1974. Kapampangan

H Kitano, Aichi University of Education, Aichi, Japan

Kapampangan (Pampangan) is spoken mainly in Pampanga Province and in parts of Tarlac, Nueva Ecija, Bulacan, and Bataan provinces of Luzon, the Philippines. It is one of the largest languages in the Philippines. The number of its speakers is estimated as 1 897 378 (1990 census).

Phonology

Kapampangan has the consonants [p, b, t, d, k, g, ʔ, s, tʃ, ʤ, m, n, ŋ, l, r, w, y] and vowels [i, e, a, ø, u].

Overview of Kapampangan Grammar

Word Order

Like other Philippine languages, Kapampangan is a predicate-initial language. Clitic pronouns and clitic adverbs usually occupy the second position of a clause, and clitic pronouns are almost always obligatory, even when their coreferent noun phrases are present.

(1) Masakit-ya ing lalaki
sick-ABS.3SG DET.ABS.SG man
'the man is sick'

Case Marking

Kapampangan has three cases: topic, genitive (or nontopic), and oblique. Since Kapampangan exhibits

an ergative system in pronominal case marking, these cases may also be called absolutive, ergative, and oblique, respectively, which are the terms used in this article.

Negation

Sentential negation is expressed by the predicate-initial *e*.

(2) E-ya masakit ing lalaki
NEG-ABS.3SG sick DET.ABS.SG man
'The man is not sick'

Existence and Possession

Both existence and possession are expressed by the existential particles *atin(g)* ('there is, be present, have') and *ala* ('there is not, be absent, do not have'). (LK = linker, realized either as = *ng* [after vowels, *n*, and the glottal stop] or *a* elsewhere)

(3) Ating metung a babai-ng malagu
EXIST one LK woman-LK beautiful
'there was a beautiful woman'

(4) Atin-ya-ng kapatad a lalaki
EXIST-ABS.3SG-LK sibling LK man
'he/she has a brother (male sibling)'

Lexical Classes

Nouns Nouns may be monomorphemic or derived by affixation. A limited number of nouns may be pluralized with vowel lengthening (e.g., *lalá:ki* 'man' and *la:lá:ki* 'men,' *babá:i* 'woman' and *ba:bá:i* 'women').

Noun phrases are formed with other lexical classes, such as adjectives and verbs, by use of the linker.

(5) ing bayu-mu-ng imalan
DET.ABS.SG new-ERG.2SG-LK dress
'your new dress'

(6) ing balita-ku-ng dimdam kang Mike
DET.ABS.SG news-ERG.1SG-LK heard DET.OBL.SG Mike
'the news I heard from Mike'

Table 1 Determiners in Kapampangan

	Absolutive	*Ergative*	*Oblique*
Common nouns			
SG	ing, = ng	ning	king, keng
PL	deng/reng	reng	karing
Personal names			
SG	i	= ng	kang
PL	di/ri	ri	kari

Verbs Verbs derive for focus (actor, patient, directional, beneficiary, and instrumental; see section on focus constructions) and inflect for aspect (contingent [contemplated, future], perfective [completed, past], and imperfective [incompleted, progressive, present]). Verbs derive by way of affixation (prefixes, suffixes, and infixes), reduplication, vowel alternations, vowel lengthening, and combinations thereof. Some other affixes denote causative, aptative (abilitative, accidental, and coincidental actions), and distributive (states or actions distributed over space and time, and repetitive actions).

Adjectives Adjectives may be monomorphemic or derived, with affixes, such as *ma-* (plural *manga-*), which is the most common adjective-forming prefix. The comparative degree is marked by *mas* (e.g., *mas maragul* 'bigger'). Superlative adjectives are formed with the prefix *peka-* (*pekamaragul* 'biggest').

Determiners Determiners, also called articles, case markers, or noun markers, prenominally indicate the case (absolutive, ergative, or oblique) and number (singular or plural) of the nouns they qualify, and whether the nouns are common or personal (Table 1).

Pronouns Pronouns may be clitic or free. Some combinations of two clitic pronouns (ergative and absolutive) may be fused into one word; e.g., *na* (ERG.1SG) + *ya* (ABS.3SG) becomes *ne* (Table 2).

Focus Constructions

In Kapampangan, as in other Philippine languages, the morphology of the verb indicates the semantic relationship between the predicate and the absolutive argument. In an actor-focus construction, the absolutive argument is semantically an actor, and the verbal predicate takes appropriate actor-focus affixes. Likewise, in a patient-focus construction, the absolutive argument is semantically a patient, and the verbal predicate takes patient-focus affixes. In the following examples of each focus construction, the boldfaced argument is the absolutive.

Actor focus:

(7) Mamangan la-ng manuk
eating ABS.3 PL-LK chicken
'**they** are eating chicken'

Patient focus:

(8) Kakanan de ing manuk
eating ERG.3PL + ABS.3SG DET.ABS.SG chicken
'they are eating **the chicken**'

Table 2 Pronouns in Kapampangan

	ABS (clitic)	ABS (free)	ERG (clitic)	OBL (free)
1 SG	ku	yaku, aku	ku	kanaku, kaku
2 SG	ka	ika	mu	keka
3 SG	ya	iya	na	kaya
1 DUAL	kata	ikata	ta	kekata
1 PL INCL	katamu, tamu, kata, ta	ikatamu, itamu, ikata, ita	tamu, ta	kekatamu, kekata
1 PL EXCL	kami, ke	ikami, ike	mi	kekami, keke
2 PL	kayu, ko	ikayu, iko	yu	kekayu, keko
3 PL	la	ila	da/ra	karela

Directional focus:

(9) Dinan me-ng
give.to ERG.2SG + ABS.3SG-LK
pera ita-ng anak
money that.ABS.SG-LK child
'give some money **to that kid**'

Beneficiary focus:

(10) Pangadi me
pray.for ERG.2SG + ABS.3SG
'pray **for him/her/it**'

Instrumental focus:

(11) Penyulat ne
wrote.with ERG.3SG + ABS.3SG
ini-ng lapis
this.ABS.SG-LK pencil
'he/she wrote **with this pencil**'

Kashmiri

S Munshi, University of Texas at Austin, Austin, TX, USA

Kashmiri, known to its speakers as kə:śur/ko:śur or kə:śɨr zabān ('Kashmiri language'), is spoken by around 4 million people in India (*Ethnologue*, n.d.), primarily in the Kashmir valley (kəśi:r) and its surrounding regions in the state of Jammu and Kashmir (J & K). Sizeable population of Kashmiri speakers also live in other states of India. Approximately 0.1 million Kashmiri speakers have been reported to live in Pakistan (*Ethnologue*, n.d.). Kashmiri speakers are also found in various other countries. Major regional dialects of the language spoken in J & K state include: Standard Kashmiri (in and around Srinagar; used for educational and literary purposes), Kashtwāri/Kishtwāri (Kishtwār valley, southeast of Kashmir valley); Poguli (southern Banihal); Sirāji (several villages of district Doda); Rāmbani (Ramban and adjoining areas), and Bunjwali. Poguli and Sirāji are considerably influenced by Dogri (an Indo-Aryan language close to Punjabi (Panjabi)). Speakers of many of these dialects often argue for the separate existence of their native speech as full-fledged languages rather than dialects of Kashmiri. Information available on Kashmiri dialects is generally based on secondary sources.

There is a possibility of existence of more regional dialects in addition to the above-mentioned, but no detailed research on Kashmiri dialectology is available so far. Besides the major regional dialects, there are conspicuous differences between urban and rural Kashmiri on the one hand (in terms of accent, phonology, and lexicon; rural Kashmiri has preserved many archaic forms not used in urban speech) and between Muslim and Hindu Kashmiri on the other (mainly in terms of borrowings; while Hindus use more Sanskrit loans, Muslims commonly borrow from Persian (Farsi, Western) and Arabic for the corresponding words. The terms 'Persianized' and 'Sanskritized' Kashmiri are sometimes used to refer to these social dialects).

Historical Development

Kashmiri has been classified along with a number of languages grouped under the title 'Dardic.' Dardic languages are spoken in the extreme north of India and northwestern Pakistan, extending into Afghanistan. There has been considerable debate over the classification of Dardic languages as to whether they are a third branch of Indo-Iranian language family (other two being Indo-Aryan and Iranian), or (at least, some of them) are of pure Indo-Aryan origin. Dardic languages have preserved many archaic Indo-Iranian features otherwise lost in the modern Indo-Aryan languages. They have also developed certain features not found in other Indo-Iranian languages. Nevertheless, the term 'Dardic' constitutes a geographical convention rather than a linguistic expression. Like other Dardic languages, Kashmiri has similarities with both Indo-Aryan as well as Iranian. After continuing debates over a long period of time, many linguists have agreed upon an Indo-Aryan origin for Kashmiri. The term 'Dardic,' however, has gained much popularity, and is still used in view of the regional peculiarities shared by Kashmiri and other languages of the group.

Kashmiri belongs to the North-Western group of the Middle Indo-Aryan (MIA) languages/dialects, which includes several Dardic languages (e.g., Shina, Khowar, Torwali), Punjabi, Sindhi, and Lahnda (Panjabi, Western). One of the characteristic features with respect to the phonological system of the North-Western group is the retention of certain features lost elsewhere. In many modern Indo-Aryan languages, Old Indo-Aryan (OIA) sibilants – *ś* (palatal), *s* (dental) and *ṣ* (retroflex) – merged into dental *s*. Kashmiri retains two sibilants, the palatal *ś* and the dental *s*. Like other Dardic languages, Kashmiri also retains the consonantal component *r* in the derivatives of the OIA syllabic *r̥*, which had a number of reflexes in MIA, viz., *a*, *i*, or *u*.

Kashmiri vocabulary can be broadly categorized into Kashmiri/Dardic, Sanskrit, Punjabi, Hindi/Urdu, Persian, and Arabic origins. Kashmiri occupies a special position in the Dardic group, being probably the only Dardic language that has a written literature dating back to the early 13th century, a writing script of its own, and the largest number of speakers among the Dardic languages. An important part of Kashmiri is its rich tradition of oral and written literature. Some of the very famous genres of Kashmiri oral literature and folklore are *rov*, *vanɨvun*, *c^hakɨr*, *ladi:-śah*, and *lukɨ-pə:t^hɨr*.

Writing Systems

Originally, Kashmiri was written in the Shāradā script, an ancient indigenous character of Kashmir. Shāradā is argued to be the predecessor of Devanāgri/Nāgri, which is built on the same system and corresponds with Shāradā letter-for-letter, although the letters

have considerably changed in form. Shāradā is closely associated with Tākri alphabet used for writing Punjabi, but, with a complete range of symbols for different vowels characteristic of Kashmiri. Its use is highly restricted to a handful of Hindu priests in writing *za:tuk/Janam-patri* ('horoscope'). The most popularly employed and officially-recognized script in current use is a modification of Perso-Arabic (Nastālīq) script. Devanāgari (again with modifications to cater to the specific requirements of the Kashmiri phonemic inventory) is also used and is popular among Hindus. Tākri (Kashtwāri and some dialects of the adjoining areas) and Roman scripts have also been employed but these have failed to gain recognition.

Phonological Characteristics

Both open and closed syllables are permitted in Kashmiri. Closed syllables, however, are preferred to open syllables. In rapid speech, in polysyllabic words with a sequence of adjacent CV syllables, speakers may drop medial vowels in favor of closed syllable structure. Final vowels are often deleted. Clusters comprising two consonants are quite common but only specific sequences can form a cluster in a particular position. Initial clusters are restricted to the type *Cr-* where the first consonant of the cluster is an obstruent. Final clusters are comprised of a homorganic nasal followed by an obstruent. The distribution of stress in Standard Kashmiri is influenced by a complex interplay of quantitative, positional, and rhythmic constraints. Primary stress appears on the word-initial syllable, which is always stressed. Stress occurs on every syllable containing a long vowel – CV:(C).

Kashmiri maintains the basic OIA pattern of five articulatory positions along with features of voice (e.g., *k* vs. *g*) and aspiration (e.g., *k* vs. k^h). Its consonant system has survived with various alterations, losses, and additions. Some of the characteristic changes are those involving the loss of aspiration of voiced plosives, change of MIA palatal affricates to those of the corresponding dental affricates, word-final aspiration of voiceless stops, and fricative weakening/lenition ($s > h$) in certain environments. There are 27 consonantal phonemes in Kashmiri that have evolved from the Old/Middle Indo-Aryan phonological system. In addition, Kashmiri has also adopted a number of consonants from the Persian and Arabic phonemic inventory. The latter include the labio-dental voiceless fricative (*f*), voiceless and voiced velar fricatives (*x* and *γ*), and uvular and glottalic stops (*q* and *ʔ*). They are found only in Persian/Arabic borrowings and are used only by literate Kashmiris in Standard Kashmiri, especially in formal speech. In informal speech and among the illiterate population, these are replaced by p^h, k^h, *g*, *k*, and *a* respectively.

Like most of the New Indo-Aryan (NIA) languages, Kashmiri vowels are subject to various phonological operations that are not only regular but also extended over a larger domain than most of the other IA languages. A significant number of changes take place in accordance with the nature and position of the vowels in a particular linguistic domain (syllable/morpheme/word). Various such changes include: vowel harmony, *svarabhakti* (vowel epenthesis), consonantal assimilation, and final vowel deletion. Kashmiri has a 16-vowel system consisting of front vowels /*i*, *i:*, *e*, *e:*, *ɛ*/, central vowels /*ɨ*, *ɨ:*, *ə*, *ə:*, *a*, *a:*/, and back vowels /*u*, *u:*, *o*, *o:*, *ɔ*/ with three contrasts in height (high, mid, and low). Kashmiri phonemic inventory is distinct in the IA languages in having central vowels /*ɨ*, *ɨ:*, *ə*, *ə:*/ (absent in most NIA languages) and dental affricates.

Morphosyntax

Kashmiri, like other IA languages, is a postpositional language. However, its word order is unique among the IA languages. Unlike other IA languages, which are typically verb-final, Kashmiri is a V2 language. That is, the inflected verb occurs at the clause-second position. In sentences with a main verb and an inflected auxiliary verb, the main verb occurs sentence-finally. Thus, the basic word order is essentially SVO(V). This is true of the matrix as well as embedded clauses, and also of *yes-no* questions and questions where the *wh*-phrase is the syntactic 'subject.' In other question formations, the *wh*-phrase occupies the clause-second position, with the inflected verb occupying third position. In most environments, V2 is obligatory. However, in certain syntactic environments, such as correlatives and conditional clauses, V2 is optional. The sentence initial position is occupied by syntactic 'subject' or any other constituent ('topic'). Except for the fixed position of the verb (and *wh*-phrase in case of questions), word order is fairly flexible. V2, characteristic of Germanic languages, is a well-developed syntactic phenomenon in Kashmiri, a non-Germanic language.

Complementation in Kashmiri is observed by optionally inserting complementizer *ki/zi* in front of the embedded clause. Relative clauses are formed by a relative-correlative construction with a pre-nominal relative pronoun in the modifying/relative clause and a correlative pronoun in the main clause following the relative clause. Relative-correlative construction is a typical areal syntactic feature.

Kashmiri is a split-ergative language. Case morphology is more or less typically Indo-Aryan. Based on thematic roles and verb class, the only argument of an intransitive clause receives either a zero/nominative case or a dative case. The most agent-like argument of a transitive clause in perfective aspect receives an ergative case and the other argument (if any) receives a nominative or dative case depending on its thematic role and the verb class. Subjects of a few intransitive verbs may appear in ergative case (e.g., verbs like *as-un* 'to laugh', *vad-un* 'to weep/cry'). Case ending behaves like a postposition so that the noun phrase appears in oblique form (a typical Indo-Aryan syntactic feature).

Kashmiri verb phrase is rich in agreement. Both subject and object agreement markers may appear on the verb. Subject agreement, however, is blocked in dative/ergative constructions where the syntactic subject is in dative/ergative case.

One of the characteristic features of Kashmiri among the Indo-Aryan languages is its three-way (instead of the typical two-way) distinction of the demonstrative pronoun, viz., (1) proximate *yi/yim* 'this/these', (2) visible *hu/hum* 'that/they (masculine)' and *ho/homa* 'that/they (feminine)', and (3) invisible/remote *su/tim* 'that/they (masculine)' and *so/tima* 'that/they (feminine)'.

Sociolinguistics of Kashmiri

Not many native speakers of Kashmiri can read the language, irrespective of their educational background. For a long time, Kashmiri has not been taught in schools. According to the three-language policy of India, languages generally taught in the schools of J & K state are Urdu (a non-native language and the official language of the state), Hindi (official language of India), and English (second official language). There is a significant amount of prestige associated with Urdu, Hindi, and English in wider linguistic domains. These factors and increasing urbanization and globalization have played a significant role toward a gradual language loss with many Kashmiri speakers.

Kate Hermansz, Lambert ten (1674–1731)

J Noordegraaf, Vrije Universiteit Amsterdam

Lambert ten Kate, who is considered to be one of the founding fathers of Germanic linguistics, was born of Mennonite parents in Amsterdam. He became a partner in his father's corn trade but resigned in 1706. "Being wealthy enough," as his first biographer has it, the versatile ten Kate "laid aside Commerce, in order to cultivate his Studies," which included various fields of both arts and sciences.

In 1707–1710 ten Kate composed his short *Gemeenschap tussen de Gottische spraeke en de Nederduytsche* ('The relationship between the Gothic and Dutch languages'). The insight that the conjugation of verbs in Dutch and Gothic follows the same pattern prompted ten Kate to divide the Gothic verbs into six classes. It is in the verbal conjugation system that ten Kate recognized the regularity of vowel alternation, which eventually led him to the discovery of what Grimm would later call 'Ablaut.' In all respects the *Gemeenschap* has proved to be more valuable and more fruitful than the work of his English predecessor, Hickes.

The years 1710–1723 saw the full development of these and other interesting linguistic observations into the main body of his *Aenleiding tot de kennisse van het verhevene deel der Nederduitsche sprake* ('Introduction to the sublime part of the Dutch language,' i.e., its etymology). Among other things, the classification of the Gothic verbs was elaborated here and applied to all the Germanic languages he was acquainted with. Ten Kate provided proof that the 'irregular' verbs were subject to rules that obtained not only in Gothic, but were valid for all branches of Germanic. The second volume of the *Aenleiding* includes two long alphabetically arranged listings of Germanic words derived from strong verb roots. As ten Kate deemed the verb to be the very first part of speech, and consequently the uppermost in the hierarchy of the *partes orationis,* this specimen of a *lexicon etymologicum* could thus be considered as a lexicon of root words.

Ten Kate's main concern was to find regularity in language, taking great care to test the rules he had discovered against an extensive corpus of linguistic data. Abandoning the techniques of ancient etymology, the Amsterdam private scholar described and justified his own research methods very carefully. Thus, he actively contributed to the empirical turn in the intellectual climate of the Dutch Republic at the beginning of the eighteenth century. As such, his works are a fine illustration of the paradigm shift that took place in Dutch linguistics around 1700 under the influence of Newtonian thought. They stand out in the 18th century as a highly successful contribution to the study of historical linguistics, in terms of both its contents and its methodology.

Katre, Sumitra Mangesh (1906–1998)

F Britto, Sophia University, Tokyo, Japan

An outstanding scholar, educator, and administrator, Sumitra Mangesh Katre was born in Honnavar, Karnataka, on April 11, 1906. After his schooling in Mangalore, he obtained a B.A. (Hons) in mathematics and Sanskrit from Madras University (1928). Subsequently, he went to the School of Oriental and African Studies, London, and obtained a Ph.D. in linguistics (1931). On his return to India, he taught at several colleges before entering the Deccan College Postgraduate and Research Institute, Pune, as Professor of Indo-European Philology in 1939. Three years later, he became the director of the institute and served in that capacity until his retirement in 1971. He then moved to the United States as a resident and taught in the Department of Oriental and African Languages and Literature at the University of Texas, Austin (1971–1976). He died on October 21, 1998, in San Jose, California.

Katre wrote 12 books and approximately 250 articles and edited several tomes on linguistics. His most noteworthy publications relate to Sanskrit manuscripts (Katre, 1949–1955), Paninian studies (Katre, 1967, 1987), Paninian lexicography (Katre, 1968–1969, 1971, 1981), Prakrit and Indo-Aryan studies (Katre, 1944, 1964, 1968), and the formation of Konkani (Katre, 1966). His *Introduction to Indian textual criticism* (1954) and *Lexicography* (1965) are highly practical textbook-like volumes.

Katre is perhaps best remembered for his dedication to the spread of linguistics in India. He pioneered the teaching of linguistics in Indian universities by actively initiating programs, influencing authorities, and educating future linguists. The Language Project, of which he was the director from 1954 to 1960, held linguistic conferences for the first time in India and conducted summer and fall schools of linguistics for the formation of linguists. Due to the Project, illustrious linguists from overseas visited India and promising Indians went overseas for linguistic training. Katre also contributed to the spread of linguistics by his active involvement in several linguistic journals, such as *New Indian Antiquary*, *The Oriental Digest*, *Indian Linguistics*, *The Bulletin of the Deccan College*, and *The Indo-Iranian Journal*, serving as an editor, board member, or founder. He gave new life to the Linguistic Society of India by having it moved from Calcutta to Deccan College, Pune, and making it the preeminent all-India organization of linguists.

A monumental project that Khatre conceived and headed for 20 years (1951–1971) is the *Encyclopaedic dictionary of Sanskrit on historical principles*. This dictionary was more than 25 years in preparation, involving excerpts from 1500 books from the Vedic period to the 18th century, and based on a data bank of 11 million words. Although the original project has been modified, several volumes have been published, and when completed, with approximately 20 000 pages, it is expected to be the largest dictionary ever made.

Katre held many administrative and consultative positions in leading academic institutions and organizations, such as the Bhandarkar Oriental Research Institute, the University Grants Commission, and the Central Institute for Indian Languages. He represented the government of India at many international conferences, such as the Congress of Linguistics in London (1952), the Congress of Linguistics in Oslo (1957), and the Munich Session of the International Congress of Orientalists (1957).

He delivered the *Wilson philological lectures* at Bombay University (1941) and the *Pratibha Devi memorial lectures* at Gauhati University (1957). He was honored with two felicitation volumes: *Indian Linguistics* volumes 29 and 30 (1968–1969) and the *Bulletin of the Deccan College Postgraduate and Research Institute* volumes 51 and 52 (1991–1992).

Kātyāyana (3rd Century B.C.)

S Shukla, Georgetown University, Washington, DC, USA

Pāṇini, Kātyāyana, and Patañjali belong to the beginning of the grammatical tradition in India. We have no records of linguistics prior to Pāṇini, whose grammar of the Sanskrit language, *Aṣṭādhyāyī*, has commanded the respect of linguists everywhere. But the quest for economy inspired by the oral tradition eventually made the task of comprehending it enormously complicated and it became intelligible only when studied with a commentary.

The major commentaries on Pāṇini are the *Vārttikas* (Explanatory rules) of Kātyāyana, which examine approximately one-third of Pāṇini's *sūtras*, and the *Mahābhāṣya* (The great commentary) of Patañjali, which is mainly concerned with explaining the *vārttikas* of Kātyāyana.

Patañjali's date (2nd century B.C.) is known through the references to the Shunga king Pushyamitra and to the invasion of the Bactrian Greeks (Belvalkar, 1976: 27). A considerable interval must have elapsed between Kātyāyana and Patañjali and between Pāṇini and Kātyāyana. Accordingly, Pāṇini is believed to have lived in the 5th century B.C., which is in accordance with the native tradition that connects him with the and king of Magadha, and Kātyāyana is believed to have lived not long after Pāṇini, in the 3rd century B.C. (Burrow, 1973: 48; Belvalkar, 1976: 24).

Kātyāyana, a descendant of the sage Kati, is known to have written two other works, the *Vājasaneyi Prātiśākhya* and *Kātyāyana śrauta Sūtra* (Belvalkar, 1976: 24). In his *Mahābhāṣya*, Patañjali calls Kātyāyana a *dākṣiṇātya* 'Southerner' (Ray, 1963: 89; Belvalkar, 1976: 25). He has been also identified with Vara-ruci, the author of *Prākrita-Prakāśa*. The *vārttikas*, for which Kātyāyana is justly famous, have not survived separately in manuscript form. They occur in Patañjali's *Mahābhāṣya*, which is mainly concerned with explaining and criticizing the *vārttikas*.

When commenting on a Pāṇini's *sūtra* (grammatical rules), Kātyāyana either repeats it or refers to it by incorporating part of it in his *vārttika*. When cross-referencing his own *vārttikas*, Kātyāyana uses the phrase "*uktaṃ vā*" or "*uktaṃ pūrveṇa*" '(with regard to this) a statement has (already) been made by an earlier rule'. In his *vārttikas,* he often uses linguistic terms not used by Pāṇini, for example, *svara* 'vowel' (for Pāṇini's *ac*) and *vyañjana* 'consonant' (for Pāṇini's *hal*). It becomes clear from his *vārttikas* on Pāṇini 8.2.83 and 8.2.84 that Kātyāyana was commenting on a language spoken by him as his mother tongue (Vasu, 1962: 2: 1582). As an example of an operation of Kātyāyana's *vārttikas,* consider the following (Joshi and Roodbegen, 1981: 25; Vasu, 1982: 300).

- Pāṇni's *sūtra* (P2.3.61).

preṣyabruvorhaviṣo devatāsampradāne

"(In the Vedas the genitive case ending is used to express the sense of accusative) after (a word denoting) offering in connection with (the verbal bases) *preṣya-* 'to send forth' and *bru-* 'to declare,' when an oblation is made to a deity."

- Kātyāyana's rectification *vārttika* on P2.3.61.

haviṣo'prasthitasya

"(The Pāṇinian phrase *haviṣaḥ* should be changed to) *haviṣo'prasthitasya* 'an oblation which has not been held ready'."

- Patañjali's explanation in his *Mahābhāṣya*, accepting Kātyāyana's *vārttika*.

Kātyāyana (3rd Century B.C.)

S Shukla, Georgetown University, Washington, DC, USA

Pāṇini, Kātyāyana, and Patañjali belong to the beginning of the grammatical tradition in India. We have no records of linguistics prior to Pāṇini, whose grammar of the Sanskrit language, *Aṣṭādhyāyī*, has commanded the respect of linguists everywhere. But the quest for economy inspired by the oral tradition eventually made the task of comprehending it enormously complicated and it became intelligible only when studied with a commentary.

The major commentaries on Pāṇini are the *Vārttikas* (Explanatory rules) of Kātyāyana, which examine approximately one-third of Pāṇini's *sūtras*, and the *Mahābhāṣya* (The great commentary) of Patañjali, which is mainly concerned with explaining the *vārttikas* of Kātyāyana.

Patañjali's date (2nd century B.C.) is known through the references to the Shunga king Pushyamitra and to the invasion of the Bactrian Greeks (Belvalkar, 1976: 27). A considerable interval must have elapsed between Kātyāyana and Patañjali and between Pāṇini and Kātyāyana. Accordingly, Pāṇini is believed to have lived in the 5th century B.C., which is in accordance with the native tradition that connects him with the and king of Magadha, and Kātyāyana is believed to have lived not long after Pāṇini, in the 3rd century B.C. (Burrow, 1973: 48; Belvalkar, 1976: 24).

Kātyāyana, a descendant of the sage Kati, is known to have written two other works, the *Vājasaneyi Prātiśākhya* and *Kātyāyana śrauta Sūtra* (Belvalkar, 1976: 24). In his *Mahābhāṣya*, Patañjali calls Kātyāyana a *dākṣiṇātya* 'Southerner' (Ray, 1963: 89; Belvalkar, 1976: 25). He has been also identified with Vara-ruci, the author of *Prākrita-Prakāśa*. The *vārttikas*, for which Kātyāyana is justly famous, have not survived separately in manuscript form. They occur in Patañjali's *Mahābhāṣya*, which is mainly concerned with explaining and criticizing the *vārttikas*.

When commenting on a Pāṇini's *sūtra* (grammatical rules), Kātyāyana either repeats it or refers to it by incorporating part of it in his *vārttika*. When cross-referencing his own *vārttikas*, Kātyāyana uses the phrase "*uktaṃ vā*" or "*uktaṃ pūrveṇa*" '(with regard to this) a statement has (already) been made by an earlier rule'. In his *vārttikas,* he often uses linguistic terms not used by Pāṇini, for example, *svara* 'vowel' (for Pāṇini's *ac*) and *vyañjana* 'consonant' (for Pāṇini's *hal*). It becomes clear from his *vārttikas* on Pāṇini 8.2.83 and 8.2.84 that Kātyāyana was commenting on a language spoken by him as his mother tongue (Vasu, 1962: 2: 1582). As an example of an operation of Kātyāyana's *vārttikas,* consider the following (Joshi and Roodbegen, 1981: 25; Vasu, 1982: 300).

- Pāṇni's *sūtra* (P2.3.61).

preṣyabruvorhaviṣo devatāsampradāne

"(In the Vedas the genitive case ending is used to express the sense of accusative) after (a word denoting) offering in connection with (the verbal bases) *preṣya-* 'to send forth' and *bru-* 'to declare,' when an oblation is made to a deity."

- Kātyāyana's rectification *vārttika* on P2.3.61.

haviṣo'prasthitasya

"(The Pāṇinian phrase *haviṣaḥ* should be changed to) *haviṣo'prasthitasya* 'an oblation which has not been held ready'."

- Patañjali's explanation in his *Mahābhāṣya*, accepting Kātyāyana's *vārttika*.

haviṣo'prasthitasyeti vaktavyaṃ

"The (statement) *haviṣo'prasthitasya* should be made. (For instance) *indrāgnibhyām chāgam havirvapāṃ medaḥ prasthitaṃ preṣya* 'Send forth to *Indra* and *Agni* the oblation (consisting of the organs of) a goat, marrow, (and its) fat which are held in readiness'."

In this example given by Patañjali, the word *haviṣ* is qualified by *prasthita* 'held in readiness', and the genitive ending is therefore not used. Instead, the words *haviṣ*, *chāga*, *vapa*, and *medas* occur with accusative endings.

There are some *vārttikas* of Kātyāyana that are, however, overruled by Patañjali (Vasu, 1962: 1: 300–301; Joshi and Roodbegen, 1981: 25), as in the following example.

- Pāṇini's *sūtra* (P2.3.62).

caturthyarthe bahulaṃ chandasi

"The sixth (genitive case ending is) often (used) to express the sense of the fourth (dative case ending) in the *Veda*." (For example, *puruṣmṛgas candramasaḥ* 'the male antelope to the very moon' in which the genitive *candramsaḥ* (not the dative *candramase*) is used.)

- Kātyāyana's *vārttika* offers an addition to P2.3.62.

ṣaṣṭhyarthe caturthīvacanaṃ

"The fourth (dative) case ending should be prescribed to express the sense of the sixth (genitive case ending in the Veda)."

- Patañjali, citing Kātyāyana's *vārttika,* illustrates it with this example.

yā kharveṇa pibati tasyai kharvas. tasyā it prāpte...

"'to her who drinks from a damaged vessel a defective (son is born)'. (Here) when (the genitive form) *tasyāh* (genitive 'to her') is about to apply (the dative form *tasyai* 'for her' is used)." But then Patañjali comments that the *vārttika* is not needed if the *sūtra* P2.3.62 is split into two:

caturthyarthī

"the fourth case ending (is used to express the sense of the sixth case ending)" and

tato'rthe bahulaṃ chandasīti

"to express the sense (of the fourth case ending the sixth case ending is) often used in the Veda."

Hence, Patañjali sees that once Pāṇini's *sūtra* P2.3.62 is understood as having two constituents, both the genitive and dative uses are explained by it and Kātyāyana's *vārttika*, suggesting an addition, is not needed.

Commenting on Kātyāyana's *vārttikas*, the celebrated 18th-century grammarian Nāgojibhaṭṭa said: "*vārttikamiti. sūtre'nuktaduruktacintākaratvaṃ vārttikatvam*" ("The characteristic feature of a *vārttika* is criticism in regard to that which is omitted or imperfectly expressed in a *sūtra* of Pāṇini") (Kielhorn, 1985: 2). It must be mentioned that a critical look at the *vārttikas* shows Kātyāyana to be a judicious admirer of Pāṇni, one who dispassionately examines Pāṇini's *sūtras*; considers objections that have been actually raised or that might be raised; and corrects them, offers additions to them, or advises that they be abandoned only when no other course is left open (Kielhorn, 1963: 47).

Katz, Jerrold J. (1932–2002)

D T Langendoen, University of Arizona, Tucson, AZ, USA

Jerrold Katz's Career

Katz received a Ph.D. in Philosophy from Princeton University in 1960. In 1961 he became Research Associate in Linguistics at the Massachusetts Institute of Technology, and he was appointed Assistant Professor of Philosophy there in 1963. He quickly rose through the ranks at MIT, becoming Professor of Philosophy in 1969. He was appointed Distinguished Professor of Philosophy and Linguistics at the Graduate Center of the City University of New York in 1975, a position he held until his death. He wrote or coauthored 11 books and over 75 articles on philosophy and linguistics, and edited or co-edited three books.

Semantics in Generative Grammar

Katz started out with the goal "to try to understand meaning in natural language using some form of Fregean intensionalism to provide a semantic theory for Chomsky's theory of generative grammar, which ... at the time had no semantic theory" (Katz, 2004: ix). He published a seminal paper with Jerry Fodor (Katz and Fodor, 1963) that proposed that semantics is a component of generative grammar, and that semantic interpretations (senses) are assigned to syntactic structures by projection rules that have some of the formal properties of transformations. In addition, they proposed that the meanings of lexical items and of the structures containing them are expressed using combinations of semantic markers that are "intended to reflect, in their formal structure, the structure of the concepts they represent" (Katz, 1972: 101). A year later Katz published a book with Paul Postal (Katz and Postal, 1964) that proposed that deep structure (underlying syntactic structure) fully determines meaning (equivalently, that syntactic transformations are meaning-preserving). This idea, along with several others that were developed around the same time, was incorporated into the standard theory of generative grammar formulated in Noam Chomsky (1965), in which deep structures are mapped (1) by projection rules to semantic interpretations and (2) by syntactic transformations to surface structures, and ultimately to phonetic interpretations.

Katz (1972) provided the most complete account of his semantic theory; two later revisions were his elaboration of the theory of illocutionary force (Katz, 1977) and his revised treatment of presupposition (Katz and Langendoen, 1976; Katz, 1979). The book also provides a vigorous defense of his views against both generative semantics and the variety of interpretive semantics found in the extended standard theory.

Language as an Abstract Object

Katz was an early champion of Chomskyan mentalism (or psychologism or conceptualism) in linguistics (Katz, 1964), according to which linguistic theory is identified with the theory of knowledge of language. However, not long after collaborating with Chomsky in a defense of mentalism (Chomsky and Katz, 1975),

Katz, Jerrold J. (1932–2002)

D T Langendoen, University of Arizona, Tucson, AZ, USA

Jerrold Katz's Career

Katz received a Ph.D. in Philosophy from Princeton University in 1960. In 1961 he became Research Associate in Linguistics at the Massachusetts Institute of Technology, and he was appointed Assistant Professor of Philosophy there in 1963. He quickly rose through the ranks at MIT, becoming Professor of Philosophy in 1969. He was appointed Distinguished Professor of Philosophy and Linguistics at the Graduate Center of the City University of New York in 1975, a position he held until his death. He wrote or coauthored 11 books and over 75 articles on philosophy and linguistics, and edited or co-edited three books.

Semantics in Generative Grammar

Katz started out with the goal "to try to understand meaning in natural language using some form of Fregean intensionalism to provide a semantic theory for Chomsky's theory of generative grammar, which ... at the time had no semantic theory" (Katz, 2004: ix). He published a seminal paper with Jerry Fodor (Katz and Fodor, 1963) that proposed that semantics is a component of generative grammar, and that semantic interpretations (senses) are assigned to syntactic structures by projection rules that have some of the formal properties of transformations. In addition, they proposed that the meanings of lexical items and of the structures containing them are expressed using combinations of semantic markers that are "intended to reflect, in their formal structure, the structure of the concepts they represent" (Katz, 1972: 101). A year later Katz published a book with Paul Postal (Katz and Postal, 1964) that proposed that deep structure (underlying syntactic structure) fully determines meaning (equivalently, that syntactic transformations are meaning-preserving). This idea, along with several others that were developed around the same time, was incorporated into the standard theory of generative grammar formulated in Noam Chomsky (1965), in which deep structures are mapped (1) by projection rules to semantic interpretations and (2) by syntactic transformations to surface structures, and ultimately to phonetic interpretations.

Katz (1972) provided the most complete account of his semantic theory; two later revisions were his elaboration of the theory of illocutionary force (Katz, 1977) and his revised treatment of presupposition (Katz and Langendoen, 1976; Katz, 1979). The book also provides a vigorous defense of his views against both generative semantics and the variety of interpretive semantics found in the extended standard theory.

Language as an Abstract Object

Katz was an early champion of Chomskyan mentalism (or psychologism or conceptualism) in linguistics (Katz, 1964), according to which linguistic theory is identified with the theory of knowledge of language. However, not long after collaborating with Chomsky in a defense of mentalism (Chomsky and Katz, 1975),

Katz rejected mentalism in favor of (Platonic) realism, according to which languages are abstract objects, and the proper theory of language is about those objects themselves, not our knowledge of them (Katz, 1981). He described this change as follows (Katz, 2004: x):

> I had been wondering about how well Frege's realism about senses, to which I was committed, squared with Chomsky's psychologism about language, to which I was also committed. I reached the conclusion that . . . a theory of abstract senses could not be fitted into a theory of concrete syntactic structures in the human mind. My solution was to adopt a realist view of grammar as a whole, a move that seemed the right choice in light of the fact that the words and sentences that grammars are theories of are plausibly regarded as types and hence as abstract objects.

In moving from mentalism to realism, Katz saw himself as extending Chomsky's revolution that overthrew empiricism in favor of rationalism, and nominalism in favor of mentalism. A fully rationalist theory of language demands that it be realist, not mentalist (Katz, 1996; see also the papers in Katz, 1985). Katz's philosophy of mathematics was similarly realist and rationalist (Katz, 1998).

Sense, Reference, and Logic

Sense is the central construct of Katz's semantic theory, in which the meaning of an expression is the set of its senses. Katz defined sense as "that aspect of the grammatical structure of sentences that is responsible for their sense properties and relations" (Katz, 2004: 17). Sense is both decompositional (words and morphemes have internal structure in the form of semantic markers) and compositional (semantic markers are combined in accordance with their syntactic structure and projection principles). Katz did not provide a complete account of sense; for example, he did not list the primitive semantic markers. Rather, he gave many examples of senses of lexical items, such as color adjectives and English verbs like *chase* and *gossip*, and statements of particular projection rules for combining them. He used the framework to address such classical philosophical problems as the color-incompatibility problem (Katz, 2004: 152–165).

In later work, Katz asserted both that sense does not determine reference and that the theory of sense is not reducible to the theory of reference, unlike Frege's account, as interpreted by Rudolf Carnap, as functions from possible worlds to extensions in them (Katz, 2004: 21). Katz had earlier affirmed, following Frege, that sense determines reference (Katz, 1972: 240). But he went on to develop a maximally 'thin' notion of sense, according to which sense merely 'mediates' reference (Katz, 1988, 2004: 47). Katz's reformulation of the relation of sense to reference was intended to put intensionalist semantics on a firm foundation, enabling it to deal effectively with problems that Quine and others have raised, such as the indeterminacy of translation, the analytic-synthetic distinction, and the meaning of proper names and natural-kind terms. Katz also broke with the Frege-Carnap tradition by holding that senses are not represented by formulas in first-order predicate logic, which he maintained is insufficiently restrictive for linguistic semantics. His own theory of sense is mereological: semantic entailment is determined by the part-whole relations among senses, according to the 'beams in the house' analogy of Kant, rather than the 'plant in the seed' analogy of Frege.

Overall, Katz's work is distinguished by its bold independence of thought and its focus on foundational questions in philosophy of language, linguistics, and mathematics.

Kawamoto, Shigeo (1913–1983)

Y Nagashima, Gakushuin University, Tokyo, Japan

Shigeo Kawamoto was born on January 3, 1913, in Tokyo. He graduated from the Department of English, Faculty of Literature, Waseda University, in 1937. After 3 years in Paris as a *boursier* (1937–1939), where he studied general linguistics and Old French, he returned to Japan and was appointed assistant professor in 1946, professor of French and linguistics from 1949 at the Faculty of Literature, Waseda University, and professor emeritus in 1983. He was founder and first president of the Semiotic Society of Japan (1980–1983), and he served as president of the Linguistic Society of Japan (1981–1983). He died on August 1, 1983.

His major fields of study include French and Japanese linguistics, general linguistics, poetics, and semiotics. His scholarly work began with an analysis of the French verbal system (Kawamoto, 1954, 1955). Later, as a result of a meeting with Roman Jakobson, he took a turn toward generative grammar, poetics, and semiotics (Kawamoto, 1967, 1969, 1981), and he translated Chomsky's *Cartesian linguistics* (1970), *Language and mind* (1975), and *Problem of knowledge and freedom* (1975). He also edited the translation of Jakobson's *Essais de linguistique général* (1973) and *Poetics*, the third volume of the *Selected writings of R. Jakobson* (1978). With his excellent practical knowledge of French and English, he compiled the *Concise French–Japanese dictionary* (1953) and *A new world English–Japanese dictionary* (1969). Three collections of his linguistic essays (Kawamato, 1976, 1978, 1979) show the wide range of his approach to Japanese and language in general.

Kay, Martin (b. 1935)

J Léon, Centre National de la Recherche Scientifique, Paris, France

Martin Kay is a well-known computational linguist. He was responsible for introducing the notions of chart parsing in computational linguistics and of unification in linguistics generally.

He was born in 1935 in Great Britain, and graduated in modern and medieval languages at Trinity College, Cambridge, in 1961. In 1958, he joined the Cambridge Language Research Unit, which was created in 1955 as one of the pioneering centers for machine translation. The works of the CLRU, gathering the philosopher Margaret Masterman, who directed the unit, the biologist R. H. Richens, the linguist M. A. K. Halliday, and computer scientists,

Kay, Martin (b. 1935)

J Léon, Centre National de la Recherche Scientifique, Paris, France

Martin Kay is a well-known computational linguist. He was responsible for introducing the notions of chart parsing in computational linguistics and of unification in linguistics generally.

He was born in 1935 in Great Britain, and graduated in modern and medieval languages at Trinity College, Cambridge, in 1961. In 1958, he joined the Cambridge Language Research Unit, which was created in 1955 as one of the pioneering centers for machine translation. The works of the CLRU, gathering the philosopher Margaret Masterman, who directed the unit, the biologist R. H. Richens, the linguist M. A. K. Halliday, and computer scientists,

among them Karen Sparck-Jones and Yorick Wilks, focused on a method of machine translation using intermediary language.

Since 1961 Martin Kay has been working in the United States. He graduated in linguistics at the University of California, Berkeley, and joined the Rand Corporation in Santa Monica, another early machine translation center, in 1964, to work on parsing programs, eventually becoming head of Rand's research in linguistics and translation. In 1972 he went to the University of California, Irvine, as Chair of Computer Science, and then in 1974 moved to Xerox Research Center in Palo Alto. In 1985 he became a Professor of Linguistics at Stanford, while retaining his position as a Research Fellow at Xerox, which he kept until 2002. Kay is a past president of the Association for Computational Linguistics and has served for many years as the Chairman of the International Committee on Computational Linguistics. He was awarded an Honorary Doctorate from the University of Gothenburg and he is also an Honorary Professor at the University of the Saarland.

Kay has contributed substantially to several areas of computational linguistics, including machine translation, the state and condition of which he has never ceased to criticize. His more recent contribution to this domain is the development of experimental prototypes of the system Verbmobil that provides simultaneous language translations. His other main achievements have focused on formal languages and formalisms and their use in parsing systems, especially unification grammars. He developed chart parsing and showed that chart parsing algorithms could be carried over to the problem of generating sentences. With Ronald Kaplan, he pioneered finite state morphology, which assumes that both the word formation rules and the morpho-phonological alternation rules can be modeled as finite state machines.

Kayardild

N Evans, University of Melbourne, Melbourne, Australia

Kayardild is spoken in Queensland, Australia, in the South Wellesley Islands, and belongs to the Tangkic family (non-Pama-Nyungan), which also includes Lardil and Yukulta. Additional and now extinct varieties are Yangkaal and Nguburindi, though the limited materials we have on these show Yangkaal to be a sister dialect of Kayardild and Nguburindi a sister dialect of Yukulta. The Tangkic languages have no close relatives, though they are related, at a distant level, to other Australian languages and share most grammatical similarities with languages along the Roper River well to the west (Evans, 1995).

Speakers of Kayardild were traditionally hunter-gatherers, with a strong emphasis on marine resources, building stone walls around the coasts to catch fish and hunting for turtle and dugong. The traditional population numbered between 120 and 150. Isolated from European contacts until the 1940s, the entire tribe was removed from their homeland in the early 1940s to the mission on Mornington Island, from which date rapid language loss set in: no one born

among them Karen Sparck-Jones and Yorick Wilks, focused on a method of machine translation using intermediary language.

Since 1961 Martin Kay has been working in the United States. He graduated in linguistics at the University of California, Berkeley, and joined the Rand Corporation in Santa Monica, another early machine translation center, in 1964, to work on parsing programs, eventually becoming head of Rand's research in linguistics and translation. In 1972 he went to the University of California, Irvine, as Chair of Computer Science, and then in 1974 moved to Xerox Research Center in Palo Alto. In 1985 he became a Professor of Linguistics at Stanford, while retaining his position as a Research Fellow at Xerox, which he kept until 2002. Kay is a past president of the Association for Computational Linguistics and has served for many years as the Chairman of the International Committee on Computational Linguistics. He was awarded an Honorary Doctorate from the University of Gothenburg and he is also an Honorary Professor at the University of the Saarland.

Kay has contributed substantially to several areas of computational linguistics, including machine translation, the state and condition of which he has never ceased to criticize. His more recent contribution to this domain is the development of experimental prototypes of the system Verbmobil that provides simultaneous language translations. His other main achievements have focused on formal languages and formalisms and their use in parsing systems, especially unification grammars. He developed chart parsing and showed that chart parsing algorithms could be carried over to the problem of generating sentences. With Ronald Kaplan, he pioneered finite state morphology, which assumes that both the word formation rules and the morpho-phonological alternation rules can be modeled as finite state machines.

Kayardild

N Evans, University of Melbourne, Melbourne, Australia

Kayardild is spoken in Queensland, Australia, in the South Wellesley Islands, and belongs to the Tangkic family (non-Pama-Nyungan), which also includes Lardil and Yukulta. Additional and now extinct varieties are Yangkaal and Nguburindi, though the limited materials we have on these show Yangkaal to be a sister dialect of Kayardild and Nguburindi a sister dialect of Yukulta. The Tangkic languages have no close relatives, though they are related, at a distant level, to other Australian languages and share most grammatical similarities with languages along the Roper River well to the west (Evans, 1995).

Speakers of Kayardild were traditionally hunter-gatherers, with a strong emphasis on marine resources, building stone walls around the coasts to catch fish and hunting for turtle and dugong. The traditional population numbered between 120 and 150. Isolated from European contacts until the 1940s, the entire tribe was removed from their homeland in the early 1940s to the mission on Mornington Island, from which date rapid language loss set in: no one born

after the move to Mornington grew up to be a fluent speaker, and today fewer than 10 speakers remain.

Apart from scanty early word lists, all materials on the Tangkic languages were recorded since the early 1960s. Practical orthographies were developed in this period. These use digraphs for a variety of phonemes, making use of *r* before a stop or nasal letter to denote retroflexion: thus *rd* for /ʈ/ and *rn* for /ɳ/; *h* after a stop or nasal letter to denote a laminointerdental articulation (with the blade of the tongue between the teeth); thus *th* for /t̪/ and *nh* for /n̪/. Other graphemes, standard in Australian orthographies, are *ng* for /ŋ/, *ny* for /ɲ/, *rr* for trilled or flapped /r/, *r* for /l/ and *j* for /c/. Distinctive vowel length is shown by doubling the letter, e.g., *aa* for /a:/.

Phonologically, Kayardild is a typical Australian language, with paired stops and nasals at six points of articulation (bilabial, velar, laminodental, laminopalatal, apicoalveolar and apicoretroflex), a single stop series without voicing contrast, no fricatives, two rhotics (a glide and a tap/trill), and a simple vowel inventory: three vowels (*a*, *i*, *u*) plus length. Primary stress falls on the first syllable unless attracted onto a long vowel.

Kayardild is typical of Australian languages in employing a rich system of case suffixes, which allow for great freedom of word order. Beyond this, the case systems of Kayardild and the other Tangkic languages are remarkable for several reasons. Firstly they exhibit 'double case marking' (see Dench and Evans, 1988; Plank, 1995), since one NP embedded in another inflects both for its own case (e.g., the possessive) and that of the head: cf. Kayardild *thabuju-karra* [brother-POSSESSIVE] 'brother's,' *wangal-nguni* [boomerang-INSTRUMENTAL] 'with the boomerang,' *thabuju-karra-nguni wangal-nguni* 'with brother's boomerang.' Secondly, Kayardild and Lardil add a further 'modal case' inflection, etymologically a case suffix, which marks tense/mood on most nonsubject NPs as a partly parallel system to the tense/mood inflection on the verb. Example (1) gives a Kayardild example using the 'modal ablative' (glossed M.ABL) to mark past tense on the object and instrument NPs in addition to the verbal 'past' inflection.

thabuju-karra-nguni-na wangal-nguni-na
brother-GEN-INST-M.ABL boomerang-INST-M.ABL
'the man hit the bird with brother's boomerang.'

Thirdly, Kayardild has a further 'complementizing' use of case suffixes, to indicate various types of interclausal relations such as being a clausal complement, as illustrated by the 'complementizing' use of the oblique in (2); note that it goes on all words of the subordinate clause, outside any other inflections. It is also used – on all words except the topicalized object – in strings of topic chains.

(2) ngada kurri-ja, dangka-ntha

brother-GEN-INST-M.ABL-C.OBL boomerang-INST-M.ABL-C.OBL
'I saw that the man had hit the bird with brother's boomerang.'

Finally, Kayardild can add a layer of 'associating case' on all nonsubject NPs of clauses whose verb has been nominalized.

Much of the how this strange system evolved has now been reconstructed with the help of data from Yukulta, the most conservative Tangkic language and representative of the proto-Tangkic situation in having an ergative: absolutive case system; see Evans (1995) for a summary. Essentially, the main clause structures found in Kayardild and Lardil result from either reanalysis of alternative semitransitive structures in Yukulta, or from the generalization of Yukulta subordinate clause morphology, with case-marking interclausal relations, e.g., proprietive for purposive or ablative for prior time, smeared over both the subordinate verb and its overt NPs. A series of catastrophic changes has thus led Kayardild and Lardil to have grammatical systems that are organized quite differently from that in Yukulta, despite the fact that almost all grammatical morphemes are cognate. These changes make the Tangkic languages a fascinating case of radical and intertwined diachronic developments linked to the abandonment of an ancestral system of ergative case marking.

Another strange feature of Kayardild is a further set of case inflections, semantically and structurally part of the set of 'normal' case inflections but with the peculiarity that they convert their hosts, morphologically, from nouns into verbs. Beneficiaries, for example, take the 'verbal dative' case *-maru-*, which then takes regular verbal inflections (3), but which is distributed across all words in the noun phrase like a case inflection. Etymologically this derives from a verb meaning 'put' but structurally it is now a part of the regular system of case suffixes.

ngijin-maru-tharra thabuju-maru-tharra.
my-V.DAT-PST brother-V.DAT-PST
'I sang a song for my brother.'

Like many other Australian languages, Kayardild has a complex set of derivatives from compass terms. To locate an entity one normally says things like 'the

east uncle' or 'the groper coming from the east'; some examples of derivatives based on the root ri- 'east' are *riinda* 'coming from the east,' *rilungka* 'eastwards,' *riliida* 'heading ever eastwards,' *riyananganda* 'to the east of,' *ringurrnga* 'east across a geographical boundary,' *riyanyinda* 'at the eastern extremity of,' *rilumirdamirda* 'sea-grass territory to the east,' *rilurayaanda* 'from one's previous night's camp in the east,' *rilijulutha* 'move to the east' and *riinmali* 'hey you coming from the east.'

Kaytetye

H Koch, Australian National University, Canberra, Australia

Kaytetye is the only member of the northern branch of the Arandic subgroup of the Pama-Nyungan language family, whose southern branch includes Arrernte (Aranda) and other languages (Hale, 1962; Koch, 2004). It is spoken in the southern part of the Northern Territory of Australia around Barrow Creek and Wauchope. Its speakers number around 200. Most contemporary people of Kaytetye descent speak, in addition to or instead of Kaytetye, one of the neighboring languages – Alyawarr, Anmatyerre (both Arandic), or Warlpiri – and varieties of English. The current language of young people differs in a number of respects from that documented in the 1960s and 1970s by Hale and Koch.

Kaytetye phonology includes the typical Australian consonants, plus a set of pre-stopped nasals, rounded consonants, and a velar glide (the unrounded counterpart to *w*). An even more rare feature is a set of pre-palatalized apical consonants. The system of unrounded consonants and their orthographic representation is shown in **Table 1**. Rounded consonants are indicated by *w* after the consonant (cluster). The vowel system consists of just /a/, a high/mid-central vowel (spelled *e* in the orthography), and a marginal /i/. There is no rounded vowel phoneme, but /e/ has rounded allophones.

Atypical phonotactic features include common word-initial V(C) syllables and final CV syllables with no coda consonant and an obligatory vowel /e/; only word-internal syllables have the full structure CV(C). Word stress falls on the first CV(C) syllable. A word like *arrkwentyarte* 'three' illustrates these features (where the stressed syllable is underlined). The atypical phonology results from a series of sound changes that are described in Koch (1997, 2004).

Nouns inflect for number and case, in the typical Australian fashion, but with some complications (Koch, 1990). Kin nouns, as illustrated in **Table 2**, are inflected for the (singular) person of possessor, by means of prefixes (former dative pronouns) for second and third person, and a suffix or zero for first person. A suffix *-nhenge* marks the category 'dyadic', designating both persons in a relationship, e.g., 'mother and child(ren)'.

Dual and plural personal pronouns, as seen in **Table 3**, mark a kinship-related category called

Concurrent	VERB while SUBJ comes	angkeyernalpe-	kwatheyernalpe-
	VERB while SUBJ goes along	angkerrape-	kwatherrapeyne-
	VERB continuously/repeatedly while SUBJ goes along	angkerrangkerrenye-	kwathelathelarre-
	VERB once while SUBJ is on the way	angkelpangke-	kwathelpathe-
Prior and subsequent	go and VERB and then return	angkenyayne-	kwathenyayne-

'section' (Koch, 1982), which distinguishes whether the participants belong to different patrimoieties (e.g., *I and my mother/spouse/sister's child*) or the same moiety; and if the latter, to the same or opposite set of alternate generation levels (e.g., *I and my siblings/grandparents/grandchildren* vs. *I and my father/brother's children*).

Verbs may inflect for the category of 'associated motion' (Koch, 1984), indicating distinctions in the direction and relative timing of movement by thesubject (usually), using markers that partially differ according to the transitivity of the verb stem (Table 4) and derive in part from former verbs of motion.

In semantics, the expression of feelings and emotions is characterized by the use of the reflexive construction of 'hear' and the mention of body parts, especially *aleme* 'stomach' (Turpin, 2002).

> *Rewenhe aleme eyterrtye-le elpathe-nke errpatye*
> 3RDSING.REFL stomach person-ERG hear-PRES bad
> 'That person feels bad'

Available language resources include a non-technical learner's guide (Turpin, 2000) and picture dictionary (Turpin and Ross, 2004), each of which includes an audio component, and a text collection (Thompson, 2003)

Kazakh

L Johanson, Johannes Gutenberg University, Mainz, Germany

Location and Speakers

Kazakh (*qazaq tili*, *qazaqša*) belongs to the northwestern or Kipchak branch of the Turkic language family, more specifically to its southern or Aralo-Caspian group. Until the early 20th century, it was called Kazak-Kirghiz, whereas Kirghiz was referred to as Kara-Kirghiz. Kazakh is primarily spoken in the Republic of Kazakhstan (*Qazaqstan Respublikasï*), a vast country situated at the center of the West Eurasian steppe zone. It borders on Turkmenistan, Uzbekistan, Kyrgyzstan, and China in the south, and on the Russian Federation in the north and west. Kazakh is also spoken by minorities in Xinjiang (China), Uzbekistan, Mongolia, Turkmenistan, Kyrgyzstan, the Russian Federation, Tajikistan, Afghanistan, etc. The number of speakers is at least 10 million. There are more than seven million in Kazakhstan, more than one million in Xinjiang, and almost one million in Uzbekistan.

Kazakh is, along with Russian, the official language of the Republic of Kazakhstan. Kazakh–Russian bilingualism is widespread. Though Kazakhs constitute half of the population of the republic, many have a low proficiency in their mother tongue. Russians make up 37% of the population. The declaration of Kazakh as the state language in 1989 was met by protests from the non-Kazakh population. In 1995, Russian was proclaimed the language of interethnic communication. Russian has a dominant status in public life as the main language of instruction, science, business, and communication in professional domains.

Karakalpak (*qaraqalpaqša*), an independent language in the political sense, is a slightly Uzbekicized variety of Kazakh. It is spoken by c. 450 000 persons, mainly in the Autonomous Republic of Karakalpakstan (*Qaraqalpaqstan Respublikasi*) in Uzbekistan, on the lower course and in the delta of the Amudarya River. Small groups of speakers live in other regions, e.g., in the Khorezm and Fergana regions of Uzbekistan and in the Dashkhowuz region of Turkmenistan.

Origin and History

Kazakh goes back to the Kipchak varieties of Uzbek tribes, who founded a huge steppe empire in the second part of the 15th century. Separatist Kazakh tribes split off from the Uzbeks during their migrations, and moved into the northern steppe regions. The ancestors of the Karakalpaks belonged to one of the most important confederations under the Golden Horde. At the beginning of the 17th century, the Kazakhs occupied Tashkent, which remained their capital until 1723. In the 18th century, Kazakh and western Mongol tribes fought for supremacy in the steppes between the Altay mountains and the Caspian Sea. The Kazakh empire disintegrated into three so-called hordes, of which the Great Horde submitted to Russia in 1717. The Kazakh territory was incorporated into Russia in the mid-19th century. A Kazakh constituent republic of the Soviet Union was established in 1920. Kazakhstan declared its sovereignty in 1990 and its full independence in 1991.

Related Languages and Language Contacts

Kazakh is closely related to Karakalpak, Kipchak Uzbek and Noghay (Nogai). Kipchak Uzbek, a vanishing variety formerly spoken mainly in the north and northwest of Uzbekistan, goes back to the original language of the Uzbek nomads. Kazakh has had old close contacts with Mongolic languages, and the recent influence on it of Russian has been strong. The southern part of Kazakhstan constitutes an intensive contact zone with Uzbek (Northern Uzbek). The Kazakh varieties spoken in China have been relatively little influenced by Chinese.

There are more than seven million in Kazakhstan, more than one million in Xinjiang, and almost one million in Uzbekistan.

Kazakh is, along with Russian, the official language of the Republic of Kazakhstan. Kazakh–Russian bilingualism is widespread. Though Kazakhs constitute half of the population of the republic, many have a low proficiency in their mother tongue. Russians make up 37% of the population. The declaration of Kazakh as the state language in 1989 was met by protests from the non-Kazakh population. In 1995, Russian was proclaimed the language of interethnic communication. Russian has a dominant status in public life as the main language of instruction, science, business, and communication in professional domains.

Karakalpak (*qaraqalpaqša*), an independent language in the political sense, is a slightly Uzbekicized variety of Kazakh. It is spoken by c. 450 000 persons, mainly in the Autonomous Republic of Karakalpakstan (*Qaraqalpaqstan Respublikasi*) in Uzbekistan, on the lower course and in the delta of the Amudarya River. Small groups of speakers live in other regions, e.g., in the Khorezm and Fergana regions of Uzbekistan and in the Dashkhowuz region of Turkmenistan.

Origin and History

Kazakh goes back to the Kipchak varieties of Uzbek tribes, who founded a huge steppe empire in the second part of the 15th century. Separatist Kazakh tribes split off from the Uzbeks during their migrations, and moved into the northern steppe regions. The ancestors of the Karakalpaks belonged to one of the most important confederations under the Golden Horde. At the beginning of the 17th century, the Kazakhs occupied Tashkent, which remained their capital until 1723. In the 18th century, Kazakh and western Mongol tribes fought for supremacy in the steppes between the Altay mountains and the Caspian Sea. The Kazakh empire disintegrated into three so-called hordes, of which the Great Horde submitted to Russia in 1717. The Kazakh territory was incorporated into Russia in the mid-19th century. A Kazakh constituent republic of the Soviet Union was established in 1920. Kazakhstan declared its sovereignty in 1990 and its full independence in 1991.

Related Languages and Language Contacts

Kazakh is closely related to Karakalpak, Kipchak Uzbek and Noghay (Nogai). Kipchak Uzbek, a vanishing variety formerly spoken mainly in the north and northwest of Uzbekistan, goes back to the original language of the Uzbek nomads. Kazakh has had old close contacts with Mongolic languages, and the recent influence on it of Russian has been strong. The southern part of Kazakhstan constitutes an intensive contact zone with Uzbek (Northern Uzbek). The Kazakh varieties spoken in China have been relatively little influenced by Chinese.

The Written Language

Kazakh did not possess a written variety in the pre-Russian period. Official documents were mostly written in Chaghatay (Chagatai) or Tatar. At the end of the 19th century a written language emerged. It was based on the dialect of the northwestern regions, where the Russian and Tatar influence was strong.

The Arabic script was used up to 1929. It was replaced by a Roman-based alphabet, which was abandoned in 1940 in favor of a Cyrillic alphabet. There are currently plans to adopt a Roman-based script again. In China, Kazakh is written in Arabic script, after an unsuccessful experiment with a Roman-based (pinyin) alphabet in the 1970s. Written Kazakh of China is still oriented towards the standard language used in Kazakhstan.

Karakalpak was established in 1925 as a language in the political sense and as a written language. Its orthography differs considerably from that of Kazakh. After the Arabic and Roman scripts had been employed for a few years, the Cyrillic alphabet was introduced in 1940. The transition to a new Roman-based script has begun.

Distinctive Features

Kazakh exhibits most linguistic features typical of the Turkic family (*see* **Turkic Languages**). It is an agglutinative language with suffixing morphology, sound harmony, and a head-final constituent order. In the following, only a few distinctive features will be dealt with. In the notation of suffixes, capital letters indicate phonetic variation, e.g., *A* = *a*/*e*. Hyphens are used here to indicate morpheme boundaries.

Phonology

Kazakh has a front vowel *æ*, which is lower than the mid-high *e* and restricted to the first syllable. It has emerged through fronting of *a*, e.g., *bæri* 'all.' High vowels are often reduced, relatively short, but not lowered as in Tatar and Bashkir. Initial *e*-, *o*- and *ö*- are often pronounced with a prothetic glide, e.g., *ʸeki* 'two,' *ᵘon* 'ten.' Initial *t*- is mostly preserved, e.g., *til* 'language' (cf. Turkish *dil*). As in most Kipchak languages, final -ɣ is labialized in monosyllabic stems, e.g., *taw* 'mountain' ← *ta:*ɣ. The affricate *č* has developed into the fricative *š*, e.g., *üč* 'three' ← *üš*, whereas *š* has developed into *s*, e.g., *tas* 'stone' ← *taš*. Word-initial *ž*- corresponds to *y*- or *ǰ*- in other Turkic languages, e.g., *žol* 'way' (Turkish *yol*). However, *ǰ*- is found in older Kazakh texts.

According to front vs. back sound harmony, a suffix vowel is back if the preceding syllable has a back vowel, and front if the preceding syllable has a front vowel. This type of sound harmony also affects consonants, e.g., *qar-*ɣ*a* [snow-DAT] 'into the snow,' *köl-ge* [lake-DAT] 'into the lake.'

According to rounded vs. unrounded harmony (labial harmony), a suffix vowel is rounded if the preceding syllable contains a rounded vowel, and unrounded if the preceding syllable contains an unrounded vowel. Spoken Kazakh displays this kind of harmony not only in high suffix vowels, but also in low vowels, e.g., *üy-dö* [house-LOC] 'in the house,' *tüs-kön* [fall-PART] 'fallen,' *öl-gön* [die-PART] 'dead.' However, *o* is not admitted, e.g., *qol-da* [hand-LOC] 'in the hand' instead of **qol-do*. The rounding effect decreases with the distance from the first syllable, e.g., *üy-dö* [house-LOC] 'in the house,' *üy-ümüz-de* [house-POSS.1PL-LOC] 'in our house.' The rounded vs. unrounded harmony is not reflected in the orthography, which does not represent the suffix vowels *ö*, *ü*, and *u*.

Kazakh exhibits numerous consonant changes, mostly assimilations, in clusters containing dentals, liquids and nasals. Suffix-initial *d*-, *l*-, *n*-, and *m*- occur after stem-final vowels and often after nasals, sonorants, and glides, but they are otherwise assimilated. Suffix-initial *d*-, *l*-, and *n*- are assimilated to *t*- after voiceless stem-final consonants, e.g., *at-tar* [horse-PL] 'horses' ← *at-lar*. Suffix-initial *d*- is assimilated to *n*- after stem-final nasals, e.g., *adam-nan* [man-ABL] 'from the man.' Suffix-initial *l*- and *n*- are changed to *d*- after most consonants, e.g., *köz-der* [eye-PL] 'eyes,' *qïz-dïᵑ* [girl-GEN] 'of the girl.' Suffix-initial *m*- is changed to *b*- after stem-final -*z* and -*ž*, e.g., *žaz-ba-* [write-NEG] 'not to write.'

Loanwords are mostly pronounced according to indigenous phonotactic rules. Consonant clusters are dissolved through consonant deletion, or insertion of high prothetic or epenthetic vowels, e.g., *xalïq* 'people' (Arabic *xalq*), *ïras* 'true' (Persian *rast*), *pïr-atsent* 'percent' (Russian *procent*), *telgirep* 'telegraph' (Russian *telegraf*), *kerewet* 'bed' (Russian *krovat'*). The consonants *f* and *x* in loanwords are replaced by *p* and *q*, e.g., *aptobus* 'bus,' *qat* 'letter.' The phonological adaptation was largely reflected in the old Arabic and Roman orthographies, but since the introduction of the Cyrillic script, Russian loanwords are written in their original form.

Grammar

The comparative suffix is -*rAK* (after consonant-final stems -*(I)rAK*), e.g., *ülken-irek* [big-COMP] 'bigger.' There is an instrumental case in -*Men*. The reflexive pronoun *öz* is used attributively or as a noun with possessive suffixes, e.g., *öz üy-im* [self house-POSS.1SG] 'my own house,' *öz-im bar-dïm* [self-POSS.1SG go-PAST-1SG] 'I went myself.'

The old flexion of pronouns is preserved, and not replaced by flexion of the nouns as in some other

Turkic languages. Pronouns ending in *-l*, e.g., *bul* 'this,' replace *-l* with *-n* in most oblique cases. The initial *b-* in *bul* is changed to *m-* in the genitive, accusative, and locative. The demonstrative pronouns *bul*, *osï*, and *mïna* are used for referents within the range of view, while *ol*, *sol*, and *ana* are used for referents out of sight. Some demonstratives exhibit emphatic forms, e.g., *mïna-w*.

The second-person plural marker *sIŋ-dAr* combines the second-person singular marker with the plural suffix. The marker *-sIz* expresses politeness when used to one addressee, whereas *-sIz-dAr* is the corresponding polite plural marker.

The suffixes *-LA-p* and *-LA-GAn*, whose first element *-LA* derives verbs stems from nouns, form approximative and multiplicative numerals, e.g., *žüz-de-gen* 'hundreds.'

Kazakh has a present tense in *-A* plus person markers, e.g., *kel-e-di* [come-PRES-3.SG] 'comes.' It has emerged from a construction containing a converb ending in *-A* + *tur(ur)* 'stands'. The old present tense form in *-(A)r* is mostly used with modal meanings, e.g., *kör-er-miz* [see-AOR-1.PL] 'we will see.' A more focal present tense, i.e. with a narrower focus on the ongoing event, is formed with the converb suffix *-(I)p* and one of the verbs *otïr* 'sits,' *žür* 'goes,' *žatïr* 'lies,' *tur* 'stands,' e.g., *žaz-ïp žatïr* [write-CONV lies] 'is writing.' The suffix *-AtIn* (*-ytIn* after vowel-final stems) forms a habitual past. There is an intentional in *-MAK*, e.g., *kel-mek-piz* [come-INTENT-1PL] 'we want to come,' and a necessitative in *-MAK-šI*, e.g., *sat-paqšï-mïn* [sell-NEC-1SG] 'I must sell.' Kazakh displays complex verbal compositions expressing actionality, aspect-tense, and evidentiality. A number of auxiliary verbs are used in postverb constructions based on the converbs in *-A* and *-(I)p* and mostly specifying the manner of action, e.g., *žan-ïp ket-* [burn-CONV go] 'to burn down.' Evidential forms are the indirective past in *-(I)p*, with *-DI* in the third person, e.g., *kel-ip-ti* [come-CONV-3SG] 'apparently came.' The evidential (indirective) copula particle *eken* combines with various items, e.g., *kel-e-di eken* [come-PRES-3SG INDIR. COP] 'apparently comes,' *kel-gen eken* [come-PART EV] 'has apparently arrived.' Unlike more Iranicized languages such as Uzbek and Turkmen, Kazakh has a weakly developed system of conjunctions.

Lexicon

The basic vocabulary related to the traditional way of life is of Kipchak Turkic origin. There is also a rich modern Kazakh vocabulary with numerous neologisms, e.g., *xalïqaralïq* 'international.' Many words are of Persian (Farsi) and Arabic origin, introduced via Tatar and Chaghatay, e.g., *bazar* 'market,' *apta* 'week,' *nan* 'bread,' *aqïl* 'intellect,' *γïlïm* 'science,' *maγïna* 'meaning,' *waqït* 'time.' Due to close contacts with other nomadic groups, Kazakh also exhibits many words of Mongolic origin, e.g., *olža* 'booty.' Kazakh of China has a fairly strong early layer of Mongolic loanwords, but relatively few loans from Chinese, at least in the written language. Russian words have been borrowed from the second half of the 19th century on. In the Soviet period, calques on Russian models and neologisms were generally preferred to loanwords. There is now a certain tendency in the written language to reduce the number of Russian loans in favor of words of native or Arabic–Persian origin.

Dialects

In spite of its huge extent, the Kazakh-speaking area exhibits little dialectal variation because of a high degree of mobility of the speakers of Kazakh throughout their history. The standard language is based on the northwestern dialect. The southern and western dialects differ from it in some respects. For example, initial *y-* is often found, e.g., *yaq* 'side' instead of *žaq*. Common Turkic *č* is often found instead of standard Kazakh *š*. Changes of suffix-initial consonants are less common. They are, on the other hand, stronger in the easternmost dialects spoken in China and Mongolia, e.g., *bala-dar* [child-PL] 'children' instead of *bala-lar* [child-PL]. The rural Kipchak Uzbek dialects in the north and northwest of Uzbekistan have been largely de-Kipchakicized and are now practically extinct due to the abandonment of the nomadic lifestyle.

The Karakalpak language displays most of the phonetic and morphophonemic characteristics of Kazakh. Word-initial *ǰ-* is, however, found instead of *ž-*, e.g., *ǰol* 'road.' Suffix-initial *l-* is not assimilated, e.g., *tas-lar* [stone-PL] 'stones' instead of *tas-tar*, *qïz-lar* [girl-PL] 'girls' instead of *qïz-dar*. There are a few morphological differences, stemming from the influence of Oghuz and Uzbek. The future suffix *-AžAK* is a loan from Oghuz. The first- and second-person plural personal markers *-MAn* and *-sAN* instead of Kazakh *-MIn* and *-sIN* are similar to Uzbek *-man* and *-san*. The vocabulary differs to a certain degree from that of Kazakh and contains more words of Arabic and Persian origin. Karakalpak has two main dialects, one northeastern and one southwestern. Certain nominally Karakalpak and Kazakh dialects in the region of Khorezm belong to the Southwestern or Oghuz branch of Turkic.

documentation; in road and other signs; in mass media (broadcasting in Kazakh must be no less than half of all broadcasting time). Kazakh and Russian are required school subjects.

The knowledge of Russian is almost universal among non-Russians. Most language minorities underwent language shift and were linguistically Russified. A high language maintenance rate is observed only among Turkic-speaking non-Kazakh groups (they also have a good command of Kazakh). A total of 3.3% of schoolchildren attend minority language schools: Uzbek, Uyghur, Tajik, German, and Tatar. There are radio programs and newspapers in German, Ukrainian, Korean, and Uyghur.

Twenty-five percent of Kazakhs are monolingual Kazakh speakers; 99.1% of Kazakhs claim to know Kazakh, which is viewed as a primary symbol of Kazakh identity; there is a wide discrepancy between actual and stated native language proficiency. The level of knowledge of Kazakh varies from region to region (Figure 1).

State language policy is aimed at the restoration of the functional domains of the Kazakh language, at the acquisition of Kazakh by the general population, and at corpus planning. Support for Kazakh at the state level has decelerated language shift among Kazakhs and has strengthened the position of Kazakh as the language of the government, mass media, education, and science. Russian remains the dominant language (Table 2).

Kazama, Kiyozo (b. 1928)

T Maruyama, Nanzan University, Nagoya, Japan

Kiyozo Kazama is a Japanese Indo-Europeanist who succeeded Harushige Kodzu (*see* **Kodzu, Harushige (1908–1973)**) at the University of Tokyo in 1972. Born in traditional downtown Tokyo in 1928, he studied Indo-European comparative linguistics with Prof. Kodzu. After working as a research assistant in the department of linguistics at the University of Tokyo, he taught linguistics at Nagoya University. In 1972 he started to teach Indo-European comparative linguistics at the University of Tokyo, from where he retired with the title of Emeritus Professor in 1989. Meanwhile he studied at the University of Vienna (Universität Wien), funded by a scholarship from the Japanese Ministry of Education (1973–1974).

One of his major fields is Indo-European kinship terms, on which he wrote his doctoral dissertation in 1978. Its revised version is published in Japan as *Studies in Indo-European kinship terms* (1984). This compilation and interpretation of new materials presents a major new synthetic viewpoint of Indo-European kinship terms, going beyond Delbrück's memorial work *Die indogermanischen Verwandtschaftsname*n (1889).

Kazama is the author of a short history of linguistics entitled *The birth of linguistics* (1978), which deals mainly with the linguistic trends from Sir William Jones to the Neogrammarians, and linguists such as Rasmus Rask, Franz Bopp, Jacob Grimm, August Schleicher, Georg Curtius, Karl Brugmann, Hermann Paul, Hermann Osthoff, Johannes Schmidt, Hugo Schuchardt, and Ferdinand de Saussure; their standpoints or methodologies are described in it clearly and succinctly. His more recent work, *In search for Indo-European Urheimat* (1993) is another exciting history pursuing the concept of an Indo-European homeland and its life and culture. He is also an author of two books concerning the Indo-European culture viewed from its vocabulary, namely, *Indo-European culture viewed from the aspect of words related to daily life* (1987) and *Indo-European culture from the aspect of words related to body parts and functioning* (1990). They belong in the tradition of academic works by Otto Schrader, Carl Darling Buck, and Emile Benveniste. In 1977 he had already translated into Japanese *Die Indogermanen* by Otto Schrader and Hans Krahe. His Latin-Greek 'contrastive' grammar, *A primary guide to Latin and Greek* (1998) is also a very useful handbook for younger scholars and students of linguistics.

Gengo Kenkyu, the journal of the Linguistic Society of Japan, has published his various linguistic

Minorities and Language; Russian; Tajik Persian; Tatar; Uyghur; Uzbek.

Kazama, Kiyozo (b. 1928)

T Maruyama, Nanzan University, Nagoya, Japan

Kiyozo Kazama is a Japanese Indo-Europeanist who succeeded Harushige Kodzu (*see* **Kodzu, Harushige (1908–1973)**) at the University of Tokyo in 1972. Born in traditional downtown Tokyo in 1928, he studied Indo-European comparative linguistics with Prof. Kodzu. After working as a research assistant in the department of linguistics at the University of Tokyo, he taught linguistics at Nagoya University. In 1972 he started to teach Indo-European comparative linguistics at the University of Tokyo, from where he retired with the title of Emeritus Professor in 1989. Meanwhile he studied at the University of Vienna (Universität Wien), funded by a scholarship from the Japanese Ministry of Education (1973–1974).

One of his major fields is Indo-European kinship terms, on which he wrote his doctoral dissertation in 1978. Its revised version is published in Japan as *Studies in Indo-European kinship terms* (1984). This compilation and interpretation of new materials presents a major new synthetic viewpoint of Indo-European kinship terms, going beyond Delbrück's memorial work *Die indogermanischen Verwandtschaftsnamen* (1889).

Kazama is the author of a short history of linguistics entitled *The birth of linguistics* (1978), which deals mainly with the linguistic trends from Sir William Jones to the Neogrammarians, and linguists such as Rasmus Rask, Franz Bopp, Jacob Grimm, August Schleicher, Georg Curtius, Karl Brugmann, Hermann Paul, Hermann Osthoff, Johannes Schmidt, Hugo Schuchardt, and Ferdinand de Saussure; their standpoints or methodologies are described in it clearly and succinctly. His more recent work, *In search for Indo-European Urheimat* (1993) is another exciting history pursuing the concept of an Indo-European homeland and its life and culture. He is also an author of two books concerning the Indo-European culture viewed from its vocabulary, namely, *Indo-European culture viewed from the aspect of words related to daily life* (1987) and *Indo-European culture from the aspect of words related to body parts and functioning* (1990). They belong in the tradition of academic works by Otto Schrader, Carl Darling Buck, and Emile Benveniste. In 1977 he had already translated into Japanese *Die Indogermanen* by Otto Schrader and Hans Krahe. His Latin-Greek 'contrastive' grammar, *A primary guide to Latin and Greek* (1998) is also a very useful handbook for younger scholars and students of linguistics.

Gengo Kenkyu, the journal of the Linguistic Society of Japan, has published his various linguistic

works, including 'Recent trends in Indo-European laryngeal theory' (1964: 45).

See also: Greek, Ancient; Kodzu, Harushige (1908–1973); Latin.

Kempelen, Wolfgang von (1734–1804)

K-Å Forsgren, Umeå Universitet, Umeå, Sweden

Wolfgang von Kempelen was born in Bratislava (Pressburg) as the son of an official servant. He studied law and philosophy in Vienna, where he attracted the attention of Maria Theresa because of a translation of an act of law from Hungarian into German and was soon appointed Secretary and eventually Counselor of the Imperial Royal Court. Kempelen took a keen interest in physics and mechanics and also classical and modern languages and literature, writing poetry and authoring a drama. In other words, he was very creative and a man of versatile talent. Kempelen proved his skill as a constructor, as an organizer, and above all as an inventor of different useful devices. In his time he reached world-wide fame because of a less useful invention, a chess machine (the 'Turk'), which turned out to be a fraud: hidden inside it was a legless but skillful chess player! Kempelen died in Vienna at the age of 71.

The reason why Kempelen's name is still remembered in linguistics today, however, is his construction of a speaking machine, which was no joke but a very serious enterprise, on which he worked for 20 years without being able to finish the fourth version of it. The third version consisted, roughly, of a bellows (lungs), a compression box (bronchus), an ivory reed (vocal cords), a leather resonator (mouth), and two small pipes (nostrils). Bellow, resonator, and pipes were modified by means of the hands. In this way Kempelen was able to produce vowels and consonants, even short words and phrases.

The construction of the machine also resulted in a close study of the phonetic prerequisites of speech, which resulted in a book (*Mechanismus der menschlichen Sprache,* 1791) containing a thorough and, for his time, accurate description of speech organs and articulation, and also of his speaking machine. His introduction contains general reflections on human language and the origin of language. Basing his opinion on J. G. Herder, Kempelen argued against the idea that language is of divine origin as propagated, for example, by J. P. Süßmilch and A. Court de Guebelin. He was generally skeptical of speculation and showed a soundly critical mind. Referring to Hungarian and non-European languages, he not only rejected the idea of one proto-language of man but also the idea of a common origin of the other European languages. This is far from the standpoint taken by J. Grimm *et al.*, but Kempelen also saw the possibility of substrates ("*Vermischung der Völker*") and the necessity to consider not only words but also syntax and word order, which are less prone to change, by the comparison of languages.

In his passion for mechanical devices and automates, Kempelen was significant for his time and a typical exponent of the Cartesian (mechanistic) world conception. His speaking machine was unique, although there had been a simultaneous experiment in 1780 by C. G. Kratzenstein, St. Petersburg, whose device, however, could only produce vowels. Kempelen was also the first to understand that the mouth cavity and not, which had previously been assumed, the larynx was important for the quality of vowels. His work was developed further theoretically and practically up to the computerized speech synthesizer technique of today.

Kennedy, Benjamin Hall (1804–1889)

V Van Elst, Seminarium Historiographiae Linguisticae, Leuven, Belgium

Benjamin Hall Kennedy was a distinguished classical scholar of wide reading, with a great talent for composition in Greek, Latin, and English verse, as can be seen, for example, in his work *Between whiles* (1877). He also edited several classical authors. His greatest contribution to the study of classics in England, however, was the publication of several successful school grammars, beginning with the *Latinae grammaticae curriculum, or a progressive grammar of the Latin language* in 1844.

Born at Summer Hill, near Birmingham, Kennedy spent his youth at Shrewsbury School, where he soon developed into a brilliant student. In 1823, he went to St John's College, Cambridge, where he gained several university awards. On his graduation Bachelor of Arts as 'Senior Classic' in 1827, he was elected fellow and classical lecturer of St John's College in 1828. Eight years later, he succeeded Dr Samuel Butler as headmaster of Shrewsbury (1836–1866). The last 22 years of his life he was Regius Professor of Greek at Cambridge.

In his lifetime, Kennedy was considered the greatest classical teacher of his century (Page, 1937–1938: 1303) for his powerful and enthusiastic manner of teaching, giving his pupils a lasting love for the classics. Today he is chiefly remembered for his grammar *The revised Latin primer* (1888), still widely used after revisions in 1909, 1930, and 1962. Its predecessor, *The public school Latin primer*, was published in 1866. It was commissioned by the headmasters of the nine chief English public schools – Shrewsbury included – with the encouragement of the Royal Commission of 1861, which recommended the use of a common Greek and Latin grammar in public schools. As the commissioners had selected the *Latinae grammaticae curriculum* as the basis of the new Latin grammar, Kennedy was asked to write the didactic manual. Subsequently, he also produced an advanced grammar as a supplement, *The public school Latin grammar* (1871), followed by an elementary version of the *Primer* entitled *The shorter Latin primer* (1888).

The *Primer* received a lot of criticism. Nevertheless, it rapidly became the standard Latin grammar in the public schools of England. Among its innovations was the introduction of the new case-order NOM (– VOC) – ACC – GEN – DAT – ABL, which, although adopted from – in addition to the Dane J. N. Madvig – the English grammarians T. H. Key and H. J. Roby (Kennedy, 1866: iv), remained linked in the English tradition with Kennedy's grammar and became the standard sequence in Britain (Allen-Brink, 1980).

Kenya: Language Situation

C Githiora, University of London, London, UK

Typology

The Niger-Congo phylum is the largest. According to Heine and Mohlig (1980), approximately 65% of Kenyans speak one Bantu language or another (e.g., Swahili, Luhya (Luyia), Kamba, etc.), while about 3% of Kenyans speak a Cushitic language (e.g., Somali, Borana, Burji, etc.) belonging to the Afroasiatic phylum. The Nilo-Saharan family is represented by many Nilotic languages of the eastern Sudanic subgroup, which make up about 30% of the total languages spoken in Kenya (e.g., Masai [Maasi], Luo, Nandi, etc.). Each of the groups can further be broken into a number of dialect clusters. Area distribution of languages in Kenya makes a striking contrast. The majority Bantu languages are spoken in only about 20% of the national territory, while Nilotic languages occupy about 35% and the Cushitic languages more than 40% of Kenya's territory.

Kenya's Bantu languages are commonly divided into three general groups: western (Luyia, Kuria, etc.), central (Gikuyu, Kamba) and Coastal (Swahili, Digo, etc.). Guthrie's 1967–1971 classification places nearly all of them, except for Taveta (G21) and Swahili (G42), in Zone E. (SIL's [1990] Ethnologue lists the two as G20 and G40, respectively. It also lists Luyia and Bukusu in the J30 group, contrary to Guthrie's classification into E32 and E31c, respectively.) All languages except Swahili are tone languages, whereby distinctions in pitch are as important in a word as distinctions in consonants and vowels in indicating differences of meaning. Tone may also indicate grammatical differences. Some languages have two to four distinct tone levels while others have two, sometimes three levels plus a slight lowering of nonlow tones (downstep). In addition to tones, the chief characteristics of Bantu languages are noun classes whereby the head noun in a sentence or phrase 'agrees' with verbs and 'concords' with its modifiers such as adjectives, singular, and plural forms accordingly, as in the following highlighted examples from Swahili:

***M**ti **hu**u ni **m**refu*	'this tree is tall'
***mi**ti **hi**i ni **mi**refu*	'these trees are tall'
***m**toto **m**dogo **a**melala*	'the small child is sleeping/asleep'
***wa**toto **wa**dogo **wa**melala*	'the small children are sleeping/asleep'

There are no Khoisan languages found in Kenya. The chief, well-known characteristic of these languages are clicks, or consonant sounds that are found in the initial position of almost every noun, verb, and adjective. Immigrants who have settled in the country for a few generations maintain languages of the Indo-European family alive, such as Punjabi (Punjabi, Eastern), Gujarati, Hindi, and English. There exists also a Kenyan Sign Language (KSL) for the deaf, approved by relevant official institutions such as the Kenya National Association of the Deaf. KSL appears mainly unrelated to other countries' sign languages, although it has been standardized with slight variations since 1961. It would appear, for example, that the deaf in neighboring Uganda and Tanzania do not really understand KSL, but those living in different parts of Kenya can understand each other completely even with some dialect differences. There is a manual alphabet for spelling and a dictionary.

Languages and Dialects

The common difficulties of establishing clear boundaries between languages and dialects are found in Kenya, which is why the estimate of total languages ranges from 30 to 60, according to different published reports. The problem is most acute when dealing with the numerous, contiguous Bantu languages spoken by two-thirds of the Kenyan population. More crucially, dialect boundaries are not clearly cut isoglosses, but rather dialect continua. In the case of Kenya, further obfustication is the result of a lack of distinction between language, ethnicity,

All languages except Swahili are tone languages, whereby distinctions in pitch are as important in a word as distinctions in consonants and vowels in indicating differences of meaning. Tone may also indicate grammatical differences. Some languages have two to four distinct tone levels while others have two, sometimes three levels plus a slight lowering of nonlow tones (downstep). In addition to tones, the chief characteristics of Bantu languages are noun classes whereby the head noun in a sentence or phrase 'agrees' with verbs and 'concords' with its modifiers such as adjectives, singular, and plural forms accordingly, as in the following highlighted examples from Swahili:

***M**ti h**uu** ni **m**refu*	'this tree is tall'
***m**iti h**ii** ni **m**irefu*	'these trees are tall'
***m**toto **m**dogo **a**melala*	'the small child is sleeping/ asleep'
***wa**toto **wa**dogo **wa**melala*	'the small children are sleeping/ asleep'

There are no Khoisan languages found in Kenya. The chief, well-known characteristic of these languages are clicks, or consonant sounds that are found in the initial position of almost every noun, verb, and adjective. Immigrants who have settled in the country for a few generations maintain languages of the Indo-European family alive, such as Punjabi (Punjabi, Eastern), Gujarati, Hindi, and English. There exists also a Kenyan Sign Language (KSL) for the deaf, approved by relevant official institutions such as the Kenya National Association of the Deaf. KSL appears mainly unrelated to other countries' sign languages, although it has been standardized with slight variations since 1961. It would appear, for example, that the deaf in neighboring Uganda and Tanzania do not really understand KSL, but those living in different parts of Kenya can understand each other completely even with some dialect differences. There is a manual alphabet for spelling and a dictionary.

Languages and Dialects

The common difficulties of establishing clear boundaries between languages and dialects are found in Kenya, which is why the estimate of total languages ranges from 30 to 60, according to different published reports. The problem is most acute when dealing with the numerous, contiguous Bantu languages spoken by two-thirds of the Kenyan population. More crucially, dialect boundaries are not clearly cut isoglosses, but rather dialect continua. In the case of Kenya, further obfustication is the result of a lack of distinction between language, ethnicity,

and culture. Nonlinguistic factors (e.g., prestige, historic-cultural ties, etc.) in a country where ethnolinguistic nationalism is prevalent may at times overshadow strict linguistic criteria normally applied to demarcate language and dialect boundaries. Where for example, Masaba, Luyia, and Bukusu are treated as different languages, linguistically this may not be so readily evident, as mutual intelligibility among them is quite high. Conversely, less mutually intelligible languages such as a Kipsikiis and Nandi are considered dialects of the same language, Kalenjin. Population data and censuses of the past have used ethnic rather than linguistic affiliation to identify people. For example, the northeastern part of the country is considered Somali-speaking because it is seen as little differentiated culturally. Yet, in addition to the more numerous Somali speakers, there are a number of distinct Oromo (Cushitic) languages such as Borana, Boni, and Garreh-Ajuran. People often identify as Luhya or Kalenjin, terms that cover several differentiated dialects and even languages. Many may also identify as Swahili because of religious and cultural practices, without letting it be known that their vernacular language is really different.

Swahili

Swahili language occupies a special position in Kenya's linguistic landscape. It is the national and official language of Kenya, now a part of the new draft constitution (2003) as such. Linguistically, it is of the coastal Bantu subgroup (G40), with several distinctive dialects spoken on the Indian Ocean islands of Lamu, Pate, Pemba, and Zanzibar. The language developed to become the common coastal language as early as the 13th century and has been greatly influenced by Arabic, with some loan words from Hindi, Persian, Portuguese, and English. Its capability to adapt to changing contexts has contributed to its unique position among the languages of East and Central Africa. Swahili is the universal lingua franca of Kenya today in small-scale trade and media. It is closely connected with urban life and with certain occupations. Our recent survey of language use in Nairobi revealed, for example, that although only 7% of the total number of respondents ($n = 1$, 300) reported Swahili as a first language, more than 50% use Swahili in their household interactions with other family members (Githiora, 2002). Swahili is in theory used as a medium of instruction in urban schools, but in practice English plays a larger role, according to teachers who participated in the same survey. However, Swahili is taught as a subject at all levels of education in Kenya, with many graduates specializing in Swahili each year from the three main national universities. Radio and television broadcasts may be heard in Swahili, English, and various Kenyan languages. In rural areas of Kenya, Swahili is usually encountered only in radio and television broadcasts, shops or business run by nonlocals, or in Swahili newspapers and pamphlets. In rural schools, children are taught in their local language up to Standard 4, but are taught Swahili as well as English as a second, examinable language. Overall, about two-thirds of Kenyans can make use of Swahili as opposed to less than one-sixth who know English (Heine and Mohlig, 1980: 61). The relationship between language, power, and ideology becomes highly relevant, as well the history and trajectory of Swahili during the modern, colonial, and post-colonial periods. For example, the language is closely connected with ethnic neutrality, urban life, and with certain occupations. Consequently, its functional roles within Kenyan society are strongly linked to the rural–urban divide, and to socioeconomic class. In addition to its geographical dialects, at least one distinct urban Swahili-based mixed code known as Sheng (Githiora, 2002) has emerged since the time of independence in the 1960s, and its influence is being felt far in the rural areas as well. Growing attention to this urban, mixed code is important in so far as how the code affects communication, education, and the desired spread and use of standard Swahili in Kenya.

Multilingualism and Language Policy

There is a high level of multilingualism among Kenyans, as citizens speak at least one other second language in addition to their first. Put differently by Heine and Mohlig (1980), Kenyans have on average a second language competence of 1.01 languages. A recent study of multilingualism and language use in Nairobi city, a microcosm of Kenya's linguistic mosaic, showed that the average number of languages spoken by a city resident is actually three, while a 25% of the total sampled live in bilingual households (Githiora, 2002). The higher mean figure in the findings in Nairobi city are probably because urban dwellers tend to speak both Swahili and English, unlike rural Kenyans. Kenya's language policy is best defined as nonexistent, despite a 1969 declaration by the ruling party (KANU) in parliament at that time, whereby Swahili was to become the official language of the country within a 5-year period. This declaration was made in good spirit, but it lacked the backing of any serious research on Kenya's sociolinguistic situation, nor was there a defined method in implementing the proposal. There was no scientific basis for defining the different roles that each or some of the 50 odd languages and their dialects could play

in different tasks within a modern Kenyan state. Such a sociolinguistic understanding would not come about until the 1980 publication of the *Atlas of Kenya's languages and dialects* by Heine and Mohlig, but even so, no concrete policy proposals have emerged backed by this ambitious study. Today, bills, parliamentary debates, laws, and statutes are still drafted in English, but parliamentarians who wish to can debate in Swahili while court interpreters a provide translation service into Swahili or any other Kenyan language as required, including Kenyan Sign Language (KSL) for the deaf.

Minority and Endangered Languages

While Swahili dominates study and discussion of Kenya's languages, a number of minority languages occupy an important position as they relate to issues of endangered languages, language contact, shift, and death. Among the larger groups of speakers, a form of stable bilingualism exists where, for example, two-thirds of Kenyans can speak Swahili, and a far smaller number are competent in English without losing competence in their vernacular languages. The situation is different in the case of smaller ethnolinguistic communities whereby bilingualism tends to be of the assimilating type. One of the consequences of cultural assimilation and adoption of the lifestyle of larger, economically better off communities is language shift which is seen as a necessity to adapt to the new value system. In most cases, it implies major changes of lifestyle such as a shift from fishing to pastoralism as in case of El Molo, Kenya's most endangered language whose estimated number of speakers left ranges from 8 to 500 on the shores of Lake Turkana in northern Kenya. This process culminating in a complete language shift has taken place (i.e., the languages are nearly extinct) among the Yaaku and Omotik, two Cushitic language speaking communities in favor of Masai, a Nilotic language. A similar process of cultural and linguistic assimilation by Gikuyu-, Kalenjin-, and Masai-speaking communities also places Okiek, a Nilotic language second on the list of Kenyan near-extinct languages. It is telling that the three assimilating communities mentioned above refer to the Okiek people and language as Ndorobo. Another case is that of Suba, a Bantu language that is also nearly completely absorbed by the larger, numerically dominant Luo (Nilotic) language. No significant pidgins have emerged from Kenya. What has been termed as Cutchie Swahili (Asian Swahili) or Shamba Swahili spoken by Asian immigrant traders and European settler farmers respectively is basically a nonstandard Swahili sociolect. The only true pidgin language of Kenya is Nubi (or Kinubi), a creolized form of Arabic spoken by a small minority of people whose origins date back to the colonial period in northern Uganda and Sudan, who now live in two communities; the larger one in Nairobi city's Kibera quarter, and a smaller one a few kilometers from Kisii town in western Kenya.

Keres

M J Mixco, University of Utah, Salt Lake City, UT, USA

Introduction

Of the 21 Pueblo tribes in the American Southwest, one speaks Zuni, a language isolate; another speaks Hopi (Uto-Aztecan family) in several Arizona villages. In New Mexico, Tanoan pueblos (speaking Tiwa, Tewa, or Towa, related to Kiowa) are interspersed with those speaking Keres (or Keresan, *Quirix* or *Quires* in 16th-century Spanish; Davis, 1959).

Historically, Keres borrowed lexically from other pueblo languages via bilingual speakers, now a defunct process. Keresan has two major dialect divisions: Eastern (Rio Grande Valley) and Western (Colorado River drainage). Mutual intelligibility among dialects increases with proximity (speaker populations follow in parentheses as cited in Mithun, 1999, from Valiquette, 1995), Western: Acoma (1930)/Laguna (2060); Eastern: Zia (504)/Santa Ana (384)-San Felipe (1985)/Santo Domingo (2965)-Cochití (525).

Beginning in 1598, Spanish influences were strong only in the area of material culture (livestock, new crops, trade goods, and technologies). The impact was slighter in nonmaterial domains (e.g., religion) because of indigenous resistance resulting in the Pueblo Revolt of 1680–1692.

Surrounded by denser Spanish populations, the Eastern dialects received the most loanwords via Spanish bilingualism that persisted into the mid-20th century. English displaced Spanish as the regional lingua franca but provided fewer loans. Keres linguistic literature is scant, despite intensive Pueblo ethnographic work.

Structural Overview

Keres consonantal series are plain (b, d, dʸ, g), aspirated (p, t, ʧ, k), and glottalized (p', t', ʧ', k') stops and affricates; sonorants (m, n, r, w, y, m', n', r', w', y'); and fricatives (s, ʂ, ʃ, s', ʂ', ʃ'). There are two laryngeals (ʔ, h); five long and short vowels, voiced and voiceless contextually (i, e, a, ɨ, u); and as many as four pitch accents (high ´, falling ˆ, breathy ˋ, and glottal ‘), depending on the dialect. Morphologically, Keres is polysynthetic, exhibiting distinct sets of prefixes on active and stative verbs to express nominal arguments without independent pronouns. Pronominal prefixes, with the subject and object fused into one morpheme, undergo especially complex phonological alternations and simultaneously encode five subject and object persons, including an indefinite and a fourth or obviative person (when the subject is hierarchically lower than the object). Also simultaneous is modality (negative, dubitative, hortative, negative hortative, future hortative, and indicative). Singular, dual, and plural numbers occur. Voice requires its own set of pronominal prefixes followed by the reflexive-reciprocal prefix /-a-/ or the passive /-aʔa- or –a'-/. Benefactives are expressed discontinuously by prefixes and suffixes. Aspect (continuous, fulfilled, and state) is suffixal, as is adverbial subordination. Some intransitive pronominal agreement examples are [ʂ̥-u'pɨ̥] ‘I or you ate,’ [k-u'pa] ‘he ate’ versus the transitives [s'-ˋaku] ‘I bit you’, [ʧ'-ˋaku] ‘you bit me,’ [ʂ̥-éku̥] ‘I bit (him),’ [s'-ˋaku] ‘he bit (him),’ [sg-àku] ‘someone bit him’ (Mithun, 1999: 438–440). The following sentences are from Davis (1964) as quoted in Mithun (1999):

ʔe ʂu ʔe yúsi n'ɨ ʔeu dya:mi ʔeu ʂu ʔe yúsi n'ɨ t'-a'gúyan-e
from there down EMPH eagle from there down 3.DUB-PASS-send-PL
‘then the eagle was sent down from above’

ʂu ʔe hauʔ dí-uw'ác'i
PRT PRT toward 3.DUB-approach
‘(the eagle) approached’

Language, Culture, and Society

The Keres language reflects the traditional interrelated cultural concerns of the Pueblo peoples, principally religious ceremonialism, agriculture, and theocratic governance. This has given rise to elaborate esoteric terminologies distinguishing the realms of the sacred from the profane. The latter categories may vary from pueblo to pueblo. There is baby talk as well as a difference between male and female speech in frequently occurring words (Kroskrity, 1983; Sims and Valiquette, 1990).

Recently, there have been vigorous efforts in some Keresan pueblos to counteract language shift (Pecos and Blum-Martinez, 2001; Sims, 2001).

Ket

G D S Anderson, University of Oregon, Eugene, OR, USA

Ket [KET] is also known as Yenisei Ostyak and Imbat[skij] Ket. There are probably fewer than 200 mother tongue speakers out of an ethnic population of 1100–1200 (Krivonogov, 1998). Ket is spoken in north central Siberia along the Yenisei river and its tributaries (e.g., Yelogui), in northern Krasnoyarski Kray, spoken mainly in the villages of Sulomai, Kellog, Surgutikha, and Maiduka. Ket is the sole surviving member of the Yeniseic language family. Related languages include Arin, Assan, and Pumpokol, which became extinct by mid-18th century; Kott, which lasted until the mid-19th century, originally spoken to the north, west, and south of Krasnoyarsk. The closely related Yugh (also known as Sym-Ket) became extinct only in 1980s, and was last spoken in Vorogovo village. Yeniseic language speakers shifted to Russian or various Turkic varieties, in particular Chulym Turkic, Xakas, Shor, and Northern Altai varieties. Yeniseic speakers previously occupied the territory south along the Yenisei to the mouth of the Dupches River. Yeniseic-speaking peoples once occupied a large area in western and central Siberia, based on the widespread use of Yeniseic hydronymics across the area. Presumably, the attested Yeniseic peoples were encroached upon and marginalized areally by the advance at various periods of Samoyedic- and Ob-Ugric-speaking peoples from the west, and Turkic and Tungusic from the south and east, until they occupied their attested position along the Yenisei. The Xiong Nu of the Chinese chronicles may have spoken a Yeniseic language.

There are three dialects of Ket: Northern, Central, Southern. Mainly Southern Ket survives in such villages as Kellog and Sulomaj. Ket is severely endangered but enjoys high status in the villages where Ket people dominate. Only a handful of young people are learning the language as a first language, but Ket instruction in primary schools has begun in certain villages (e.g., Kellog), based on the written form of Ket developed by native Ket scholars and Professor Heinrich Werner.

Ket is unique among central Siberian languages for its unusual system of tone. Tones appear as a prosodic feature of the two leftmost syllables (if present) in Ket words (Vajda, 1999).

(1) Southern Ket
$^{1}s^{j}ul^{j}$ 'blood'
$^{2}s^{j}u^{ʔ}l^{j}$ 'white salmon'
$^{3}s^{j}u{:}l^{j}$ 'sled'
$^{4}s^{j}ul^{j}$ 'cradle hook'
(Vajda, 1999: 5)

Tone differentiates both lexical and grammatical forms in Ket.

(2) Southern Ket
ásɛ̀l 'ski' *àsɛ́l* 'type of large covered houseboat'

Ket

G D S Anderson, University of Oregon, Eugene, OR, USA

Ket [KET] is also known as Yenisei Ostyak and Imbat[skij] Ket. There are probably fewer than 200 mother tongue speakers out of an ethnic population of 1100–1200 (Krivonogov, 1998). Ket is spoken in north central Siberia along the Yenisei river and its tributaries (e.g., Yelogui), in northern Krasnoyarski Kray, spoken mainly in the villages of Sulomai, Kellog, Surgutikha, and Maiduka. Ket is the sole surviving member of the Yeniseic language family. Related languages include Arin, Assan, and Pumpokol, which became extinct by mid-18th century; Kott, which lasted until the mid-19th century, originally spoken to the north, west, and south of Krasnoyarsk. The closely related Yugh (also known as Sym-Ket) became extinct only in 1980s, and was last spoken in Vorogovo village. Yeniseic language speakers shifted to Russian or various Turkic varieties, in particular Chulym Turkic, Xakas, Shor, and Northern Altai varieties. Yeniseic speakers previously occupied the territory south along the Yenisei to the mouth of the Dupches River. Yeniseic-speaking peoples once occupied a large area in western and central Siberia, based on the widespread use of Yeniseic hydronymics across the area. Presumably, the attested Yeniseic peoples were encroached upon and marginalized areally by the advance at various periods of Samoyedic- and Ob-Ugric-speaking peoples from the west, and Turkic and Tungusic from the south and east, until they occupied their attested position along the Yenisei. The Xiong Nu of the Chinese chronicles may have spoken a Yeniseic language.

There are three dialects of Ket: Northern, Central, Southern. Mainly Southern Ket survives in such villages as Kellog and Sulomaj. Ket is severely endangered but enjoys high status in the villages where Ket people dominate. Only a handful of young people are learning the language as a first language, but Ket instruction in primary schools has begun in certain villages (e.g., Kellog), based on the written form of Ket developed by native Ket scholars and Professor Heinrich Werner.

Ket is unique among central Siberian languages for its unusual system of tone. Tones appear as a prosodic feature of the two leftmost syllables (if present) in Ket words (Vajda, 1999).

(1) Southern Ket
$^{1}s^{j}ul^{j}$ 'blood'
$^{2}s^{j}u^{ʔ}l^{j}$ 'white salmon'
$^{3}s^{j}u{:}l^{j}$ 'sled'
$^{4}s^{j}ul^{j}$ 'cradle hook'
(Vajda, 1999: 5)

Tone differentiates both lexical and grammatical forms in Ket.

(2) Southern Ket
ásὲl 'ski' *àsέl* 'type of large covered houseboat'

bʌ̀ntán	'mallard duck'	*bʌ́ntàn*	'mallard ducks'

(Vajda, 1999: 13)

The Ket dialects differ tonally primarily in the realization of the fourth tone, which may be falling with a short vowel and no pharyngealization (Southern Ket), or pharyngealized with a long vowel (Central and Northern Ket).

(3)

Southern Ket	Central Ket	Northern Ket	gloss
^{4}*sʲɛlʲ*	^{4}*sʲɛ:lʲi*	^{4}*sʲɛ:lʲi*	'reindeer'
^{4}*asʲ*	^{4}*a:sʲe*	^{4}*a:sʲe*	'feather'
^{4}*ɨrʲ*	^{4}*ɨ:də*	^{4}*ɨ:rʲe*	'spring'

(Vajda, 1999: 7)

Although Ket is unique among the languages of Siberia for its tone/register system (certain Ket tones, e.g., tone 2, are associated with pharyngeal tension), Ket is typical of north-central Siberian languages for its elaborate case system (Anderson, 2003). Nouns may appear in one of ten or eleven case forms. Ket is unusual for Siberian languages in distinguishing three genders or noun classes, roughly masculine, feminine, and other/neuter. One set of the case forms encodes these distinctions. Others do not and appear to be more recently fused postpositional constructions.

(4) Ket

hɨb-daŋa	*hun-diŋa*
son-DATIVE.MASCULINE	daughter-DATIVE.FEMININE
'to (his) son'	'to (his) daughter'

(Werner, 1997: 105)

In addition, Ket makes extensive use of case forms on verbs as well within a highly diversified system of case-marked clausal subordination that dominates complex sentence structure in the languages of the region.

(5) *-diŋalʲ* Ablative → 'after,' 'since'

Ket

bu	*ətn-asʲ*	*du-ɣ-a-raq-diŋalʲ*
he	we-INS/COM	I-SEP-PRES-live-ABL
dɔŋ	*sɨkŋ*	*u-ɣɔñ*
three	year.PL	III-go

'three years have passed since he's been living with us'

(Werner, 1997: 353)

Among the most noteworthy features of Ket from a typological and areal perspective is its elaborate and highly complex verbal system. There are many different structural positions or slots within the Ket verb, the exact number of which is debated by Ket specialists (e.g., Werner (1997) assigns 18 such slots (14 prefix positions, a root, and three suffix positions), while Vajda (2003), on the other hand, considers there to be 10 such slots in the Ket verb (eight prefix position, root + one suffix position). Some examples of complex Ket verb forms include the following:

(6)

da-bágdɛ̀ŋ-ú-ɣ-à-vɛt	*d-us'-n-ba-ɣɔ-v-in'-tet*
3FEM-drag-3NEUT.OBJ-DIR-PRES-ITER	3M-INCORP-DER-1-PST-INAN-PST.PRF-hit
'she drags it often'	'he has hit me'
(Vajda, 2003: 63)	(Werner, 1997: 156)

Morphosyntactically, Ket stands out for its unusual predilection for multiple encoding of a single category, e.g., subject in verbs or plurality in nouns. Examples of this kind of redundant encoding may be seen in the following examples.

(7) Ket

d-dəŋ-b-it-n	^{1}*qa-ŋ-s-eŋ-naŋal'*
1-1PL-INAN-transport-PL	chief..-PL-..chief-PL-PL:ABL
'we transport it'	'from the chiefs'
(Shabaev, 1987; Werner, 1995)	
	< ^{4}qa[:]s 'chief'

A number of proposals have been offered on the possible wider genetic affiliation of the Yeniseic languages, including connections with Burushaski, Sino-Tibetan, and Northeast Caucasian languages of Eurasia, as well as Athabaskan (Na-Dene) languages of North America. To date, only the latter proposal has met with any positive reactions among specialists.

Khasi

G D S Anderson, Salem, OR, USA

The Khasi are a group of Mon-Khmer speakers living predominantly in the Khasi and Jaintia Hills region of Megahlaya state in northeastern India, with a smaller number in Assam, West Bengal, and Manipur states. In some sources, the Khasi have been called Khuchia. The vast majority of Khasi people (ca. 90%) live in India, with a further 10% living across the border in Bangladesh. Khasi [KHI] is the only language of the Mon-Khmer group of Austroasiatic spoken this far to the west.

Traditionally the Khasi are divided into a number of 'dialect' groups, but perhaps it is more sound from a linguistic perspective to speak of a small group of related languages sometimes labeled Khasic or Khasian. These 'dialects' or closely related languages include the following (Grimes, 2000; Parkin, 1991):

(1) Khasic languages
- a. Amwi [AML]
- b. Bhoi
- c. Lyngngam
- d. Pnar (aka Synteng or Jaintia) [PBV]
- e. Khynriam or Cherrapunji/Standard Khasi [KHI]
- f. War

Of these dialects/languages, Lyngngam is most linguistically distant from the standard Khasi dialect, while Pnar is the closest. Amwi is also quite distant from Standard Khasi. Lyngngam may include a linguistically Khasified Garo element (a Tibeto-Burman language), while War and Bhoi may include assimilated Mikir (Tibeto-Burman) elements. The Pnar (Synteng/Jaintia) ruled a kingdom in the region from at least 1500 to 1835, when it was disbanded by the British colonial authorities (Parkin, 1991: 58). Further Khasic varieties include Lakadong and Mynnar. Other local Khasic varieties may (in fact probably do) exist, and there is also considerable microlevel variation.

According to figures from the India Missions Association in 1997, there were just under 1 million total Khasi speakers, including all the above mentioned dialects/languages (the actual estimated figure is 950 000). Khasi is a literary language and a language of media and government in Meghalaya. There are even radio and television broadcasts in the Standard Khasi language. Phonologically, Khasi exhibits some areally and typologically atypical initial clusters, e.g., [bt], [ks], [kt], [ktH], and so on.

(2) *bta* 'wash/besmear face' *ksew* 'dog' *kti* 'hand' *kt*^{h}*áw* 'grandfather'

Syntactically, Khasi is SVO, while other Khasic languages show different basic word orders as well as many other different features.

(3) <u>Khasi</u>
phi-m ʔiithuʔ ya ŋa
you-NEG recognize OBJ I
'don't you recognize me?'
(Rabel, 1961: 61)

Morphosyntactically, Khasi is characterized by use of gender markers and a system of personal verb inflection, albeit within a predominantly isolating structure.

(4) <u>Standard Khasi</u>
u khinnaʔ u-m bam
DET.M boy MASC-NEG eat
'the boy doesn't eat'
(Nagaraja, 1993: 5)

In addition, there is evidence of a now (mainly) covert noun-class system that manifests itself in the form of lexicalized prefixes in noun stems. This system of gender classifiers is highly marked for Austroasiatic. This and the unusual phonology of Khasi set it apart from its sister languages spoken to the east.

In terms of verbal derivational morphology, Khasi, like its sister languages to the east, makes use of a causative prefix consisting of a labial consonant in various allomorphic realizations.

(5)

i. <u>Khasi</u>	<u>Khasi</u>	<u>Khasi</u>
ph-rung 'penetrate'	*ph-láit* 'clear away'	*b-ta* 'wash/besmear face'
< *rung* 'enter'	< *láit* 'be free'	
(Henderson, 1976b: 487)	(Henderson, 1976b: 487)	(Henderson, 1976b: 487)

Negative occurs in the form of either an enclitic to a subject pronoun or gender agreement marker or proclitic to the verb stem, depending of the tense/aspect value of the clause. Note also the presence of fused subject+tense forms in Standard Khasi as well.

(6) <u>Standard Khasi</u>

phi-m ʔiithuʔ ya ŋa	*ŋan ʔm-thoʔ*
you-NEG recognize OBJ I	I.FUT NEG-write
'don't you recognize me?'	'I'm not writing'
(Rabel, 1961: 61)	

Standard Khasi
u khinnaʔ u-m bam
DET.M boy MASC-NEG eat
'the boy doesn't eat'
(Nagaraja, 1993: 5)

In Bhoi, another language of the Khasic subgroup of Mon-Khmer, the negative has a different phonological shape and occurs between the lexical verb and a postposed gender/agreement marker.

(7) Bhoi
u khannaʔ bam re u
DET.M boy eat NEG MASC
'the boy doesn't eat'
(Nagaraja, 1993: 5)

Bound aspectual or tense morphemes are rare in Eastern Austroasiatic. There is, however, a quasi-bound suffixal past tense marker in *-laʔ* and a future in *-diʔ* in Lyngngam, a language of the Khasic subgroup.

(8) Lyngngam

brə kyu	*di-laʔ*	*liŋba*	*laʔtap*
man 3PL	go-PAST	through	forest

'the men went through the forest'
(Nagaraja, 1996: 43)

nə dənni	*nə di-laʔ*	*tu dənni-diʔ*
I go.NPAST	I go-PAST	he go.NPAST-FUT
'I go'	'I went'	'he will go'

(Nagaraja, 1996: 44)

mi binnəŋ-diʔ	*mi baŋ-laʔ*
you eat.NPAST-FUT	you eat-PAST
'you will eat'	'you ate'

(Nagaraja, 1996: 44)

In terms of nominal derivation, Khasi, like virtually all Austroasiatic languages, may derive deverbal nominals through a process of *-n-* infixation. Note that sometimes the derived noun reflects a more archaic phonological form than the verb stem it (historically) derives from, e.g., the preservation of initial *s-* in the word for 'wing' while the corresponding verb stem 'fly' has shifted this to *h-*.

(9) Khasi

shnong	*sner*
'village' < *shong* 'sit, dwell'	'feather, wing' < *her* 'fly'

(Henderson, 1976b: 517–518)

Like many Austroasiatic subgroups (Anderson and Zide, 2002), Khasic languages show irregular correspondences in the free-forms of nouns, while the corresponding 'underlying' (usually CVC) roots are clearly cognate across the subgroup. Note the following forms in this regard:

(10) Irregular Khasic correspondences

Khasi	Lyngngam	Synteng	Amwi	Lakadong	Mynnar	War	gloss
ksew	*ksu:/'su:*	*ksaw* ~*kswa*	*ksiá*	*ksaw*	*ksow*	*ksià*	'dog'
sim	*sim*	*sim*			*ksem*	*ksem*	'bird'
khmat	*kh'mat*	*khmat*	*ma:t*	*ma:t*		*ma:t*	'eye'
khmut	*leo- 'mut*	*khmut*	*mur-koŋ*	*mur-koŋ*		*myrkoŋ*	'nose'

(Fournier, 1974: 86–92)

That elements like *k-/kh-* are historically prefixes in Khasi is attested to by such facts as the following alternations. The original root forms appear as CVC 'combining form' elements in compounds.

(11) Khasi
kti but ***tiipdeŋ*** 'middle finger.' (Rabel, 1961: 44)
khmat but ***matliʔ*** 'white of eye.'
also ***ʔiimat*** 'eye' < see-eye/face (Rabel, 1961: 149)
khnaay 'mouse. rat' but ***naay****saaw* 'small red hill mouse'

Note in this regard also the following alternations:

(12) Khasi
kpa, kmi(e) 'father, mother' (non-vocative) vs.
ʔii paa ʔii mey address term used by children to parents 'da ddy/mommy' (Rabel, 1961: 49)

Khmer

M Minegishi, Tokyo University of Foreign Studies, Tokyo, Japan

Khmer (Cambodian)

In the Kingdom of Cambodia, most of the population of 10 716 000 (1998 UN) are considered speakers of Khmer. Its dialectal varieties are spoken by around 1.3 million ethnic Khmer people in the northeastern and eastern provinces of Thailand. The former variety is called Northern Khmer, or sometimes Surin Khmer. Another variety is spoken by more than one million people of the Khmer ethnic group, called Lower Khmer, in southern Vietnam.

Khmer is one of the major languages of Mon-Khmer subgroup of the Austroasiatic language family. It is a typical Mon-Khmer language in that phonemically its native words are either monosyllabic or disyllabic; it has no tonal distinction and is of the isolating type syntactically.

Script and Written Records

Khmer script is one of the oldest scripts in mainland Southeast Asia that originate in South India. Archeology has shown that the communication between Southeast Asia and India dates back to the beginning of the Christian era. Khmer legend, according to the Chinese document, says the local queen married the prince from India, and they became the founders of the Khmer kingdom, which suggests the existence of local matrimonial authority influenced by the Indian civilization, such as Hinduism.

The oldest Khmer inscription in old Khmer dates from 611 C.E., in addition to which there are also undated inscriptions, or presumably older ones written in Sanskrit. The inscriptions spread not only in Cambodia, but also in parts of Thailand and southern Vietnam, which suggests that the ethnic group was formerly more widespread than it is in the present and once exerted a strong cultural influence over the area.

Phonology and Phonetics

A Khmer native word is either monosyllabic or disyllabic. In a disyllabic word, a minor syllable precedes a major syllable. In a minor syllable, the inventory of possible vowels is smaller than in a major syllable. A major syllable is pronounced with stress when preceded by a minor syllable. Using the abbreviations

Khmer

M Minegishi, Tokyo University of Foreign Studies, Tokyo, Japan

Khmer (Cambodian)

In the Kingdom of Cambodia, most of the population of 10 716 000 (1998 UN) are considered speakers of Khmer. Its dialectal varieties are spoken by around 1.3 million ethnic Khmer people in the northeastern and eastern provinces of Thailand. The former variety is called Northern Khmer, or sometimes Surin Khmer. Another variety is spoken by more than one million people of the Khmer ethnic group, called Lower Khmer, in southern Vietnam.

Khmer is one of the major languages of Mon-Khmer subgroup of the Austroasiatic language family. It is a typical Mon-Khmer language in that phonemically its native words are either monosyllabic or disyllabic; it has no tonal distinction and is of the isolating type syntactically.

Script and Written Records

Khmer script is one of the oldest scripts in mainland Southeast Asia that originate in South India. Archeology has shown that the communication between Southeast Asia and India dates back to the beginning of the Christian era. Khmer legend, according to the Chinese document, says the local queen married the prince from India, and they became the founders of the Khmer kingdom, which suggests the existence of local matrimonial authority influenced by the Indian civilization, such as Hinduism.

The oldest Khmer inscription in old Khmer dates from 611 C.E., in addition to which there are also undated inscriptions, or presumably older ones written in Sanskrit. The inscriptions spread not only in Cambodia, but also in parts of Thailand and southern Vietnam, which suggests that the ethnic group was formerly more widespread than it is in the present and once exerted a strong cultural influence over the area.

Phonology and Phonetics

A Khmer native word is either monosyllabic or disyllabic. In a disyllabic word, a minor syllable precedes a major syllable. In a minor syllable, the inventory of possible vowels is smaller than in a major syllable. A major syllable is pronounced with stress when preceded by a minor syllable. Using the abbreviations

C for a consonant, V for a vowel, F for a syllable final consonant, 'r' for a liquid and parentheses for an optional element, a minor syllable can be either CVF or C(r)V, where only nasals can appear as F.

Likewise, a Khmer major syllable can be illustrated as C (C) V F. Vowels are either long or short. The long and short contrast is also found among diphthongs. A short vowel occurs only in a checked syllable: it must be followed by a syllable-final consonant, whereas a long vowel can occur both in an open and checked syllable.

Consonants

Consonants in the syllable-initial position are given in Table 1, where the IPA symbols, when necessary, are given in the brackets.

Of these consonants, only nasals /m, n, ɲ ŋ/, unreleased stops /p˺, t˺, c˺, k˺/, a glottal stop /ʔ/, fricatives /v, y, h/ and a liquid /l/ can occur in the word-final position as well. /r/ in the word-final position, once pronounced, is lost except in the Northern Khmer dialect in Thailand. /f/ appears only in loanwords.

The distinction between voiceless unaspirated and voiceless aspirated stops can be found only in the syllable initial or intervocalic position. Voiceless aspirated consonants could be further analyzed as consonant clusters /p/ + /h/, /t/ + /h/, /c/ + /h/, /k/ + /h/, as there are some words that have an infix between the first stop and the second fricative /h/. Characteristic of the Khmer consonants is that Khmer allows a variety of two-consonant combinations in the syllable initial position of a major syllable. Regarding the above aspirated stops as consonant clusters, 84 combinations in total are possible.

Vowels

Modern Khmer has a complicated vowel system. Although several dictionaries have been published for Khmer, there is no consensus as to the vowel phonemic system. As a result, almost every dictionary has its own phonemic transcription. The main reason for the discrepancy is that some assume the existence of resister contrast, i.e., contrast between 'breathy' and 'clear' phonation type, but others do not.

Table 1 Khmer consonants

p	t	c [tɕ]	k	ʔ
ph	th	ch [tɕh]	kh	
b[ɓ]	d[ɗ]			
m	n	ɲ	ŋ	
	r l			
(f) v	s y[j]			h

Table 2 shows the standard Khmer long vowels and diphthongs in phonetic transcription with the transliteration of orthography of Indic origin. The register contrast, which had been regarded as phonemic, has been lost in the dialects in Cambodian territory, and diphthongization has occurred in compensation. See Minegishi (1985) for details of phonetic values of Khmer dialects. According to Wayland and Jongman (2003), the remnant of phonation contrast is observed in the dialect of eastern Thailand.

Note that, "æ, ɨ̄, ə" are transliterations for Khmer original scripts, which do not exist in the ordinary Indic script system. A '1' following the transliteration means that the consonant preceding the vowel symbol is of voiceless group; '2' indicates the preceding consonant of the voiced group. In addition, there are diphthongs /ɯə, ɔə, uə/. In total, there are 12 long vowels and eight diphthongs. This complexity is attributable to the loss of voiceless and voiced contrast in the syllable-initial position for stops and successive divergence of vowels. See 'Historical Phonology' below for details. Table 3 shows the Khmer short vowels and diphthongs.

Historical Phonology

The phonemic reconstruction by Sakamoto based on Khmer inscriptions has established the old Khmer vowel phonemes as */i, e, ɛ, a, aa, (ɯ), ə, u, o, ɔ, ɒ, ɒɒ, iə, uə/.

By the above reconstruction and modern orthography, diachronic changes in their phonological systems can be internally reconstructed as follows.

Formerly, Khmer had a phonemic contrast, e.g., /*kaa/ and /*gaa/ as its orthography shows, where the

Table 2 Khmer long vowels and diphthongs

Phonemic	*Orthography*
iː	ī-2
eː	e-2
e̞ː	e-1
ɛː	æ-2
aɛ	æ-1
ɯː	ɨ̄-2
ə̞ː	ə̄-2
əː	ɨ̄-1
aə	ə̄-1
iə	ā-2
aː	ā-1
uː	ū-2
o̞u	o-2
oː	ū-1
o̞ː	a-2
ɔː	a-1
ao	o-1

difference is between voiceless and voiced consonants. Later, the vowel following the voiced consonant changed its quality; /*kaa/ and /*gèa/, where phonemic contrast between the consonants still existed and the difference in the vowel register, i.e., 'clear' versus 'breathy' phonation type respectively, was irrelevant. Later on, the voiceless and voiced distinction in stops was lost and the difference in the voice quality in turn carried the phonemic contrast; /*kaa/ and /*kèa/. In the present, the voice quality is no longer phonemic; instead vowel articulation is relevant; /kaː/ and /kiə/. The divergence of vowels is well preserved in the standard Khmer around Phnom Penh area, but in the rest of the country, vowels have merged again to simplify the vowel system. As a result, most of the dialects have only /iː, eː/ as long front vowels, etc. Northern Khmer, conversely, has retained most of the vowel contrast as monophthongs.

Tonal Contrast

As is usual in Mon-Khmer languages, Khmer does not have tones. The only exception, however, is the colloquial style of Phnom Penh dialect, which has acquired a tonal contrast, a level tone versus a raising-falling one: the latter is a compensation for the phonemic change /r/ into /h/, and the successive loss of /h/.

Morphology

Khmer, although syntactically of an isolating type, has a large number of derivational prefixes and infixes, which have been fossilized and are no longer productive in word formation. A word may have either a prefix or infix, but not both. Thus, native words are either monosyllabic or disyllabic. Like other Mon-Khmer languages, Khmer has no suffix. It has prefixes and infixes for causativization, specification, nominalization, intransitivization, repetition, etc., and infixes representing instrument, agent, result, object, etc., of an action.

Grammar

Khmer is an isolating language with no inflection in verbs, nor case marking in nouns. As a result, classifying word classes must be done by means of their distribution and class meaning. Noun modifiers follow the noun, verb modifiers follow the verb.

Table 3 Khmer short vowels and diphthongs

i	ɯ	u
e	ə	o
ɛ		ɔʷ
ɛə	a	ɔ

Khmer's main word classes are as follows, although further classification considering the syntactic distribution is possible: nouns, numerals, classifiers, demonstratives, pronouns, verbs, preverbs, adverbs, expressives, conjunctions, and final particles.

Of these, classifiers are few in number and rarely used except for counting persons, animals, or books. There are two demonstratives. Pronouns are a subclass of nouns, most of which are also used as nouns. Along with titles and kinship terms, choice of pronouns shows relative social positions. Verbs can be further classified as active and stative (adjectival) verbs. Preverbs may precede verbs adding modal meaning, such as 'may, must,' etc., to them. Adverbs may follow a verb. Expressives are a subclass of adverbs, describing noises, shapes, movements, emotions, etc. Final particles may be in the sentence-final position to denote the intentions and emotions of the speaker, etc.

The basic word order is Subject+Verb+(Object). A modified noun (head) is followed by a modifier. Nouns and stative verbs can be used as modifiers. Prepositions (or a noun grammaticalized as a preposition) precede a noun.

The typical noun phrase can be described as follows where optional elements are in parentheses.

Noun+(Verb)+(Numerals)+(Classifier)+(Demonstrative)

In case a clause is used for the noun modifier, the word order is as follows.

Noun+(Relative clause marker+Clause)+(Demonstrative)

A verb may be followed by a noun to form a verb phrase. Several verbs, sometimes with a noun inserted in between, form a serial verb construction, or verb serialization without any change in verbal forms, such as V(N)V(N), etc. In a serial verb construction, two or more verbs may be in various semantic relations, such as an action and its direction, an action and its objective, successive actions, an action and its result, an action and its manner, or an action and its means, etc.

Vocabulary

As one of the earliest languages in Southeast Asia that has accepted Indianization, earlier Hinduism, and later Theravada Buddhism, Khmer has borrowed Sanskrit and Pali loans, especially for religion, administrative, and other cultural vocabulary. It also has exerted a huge influence over adjacent Thai, which in turn borrowed a large number of Khmer words, such as honorific vocabulary used for the royal family. As a result of long-term contact with Thai, Khmer also borrowed many words from Thai.

Khoesaan Languages

W H G Haacke, University of Namibia, Windhoek, Namibia

The recognition of Khoisan (Khoesaan) as one of the four language phyla in Africa received initial impetus mainly through the 'Macro-Khoisan Hypothesis' of Joseph Greenberg, first published in 1950. This controversial phylum comprises his 'Click languages,' which formerly were known as 'Hottentot' and 'Bushman' languages, respectively. Dorothea Bleek (1929) had paved the way for their integration into one family by challenging the prevalent view that Hottentot as a Hamitic language had been influenced by Bushman, and by suggesting instead that Nama (as representative of Hottentot) was a Bushman language with Hamitic admixture. Bleek divided the Bushman languages into Northern, Central, and Southern groups. In essence, these divisions are still recognized today, although their validity is open to challenges (see **Table 1**).

The compounded name Khoisan was coined in 1928 by Leonhardt Schultze to signify the somatoracial relatedness of the Hottentots and Bushmen, with *khoi* ('human being,' correctly spelled *khoe*) representing Hottentot, and *san* – the Nama designation for the Bushmen, meaning 'foragers' (correctly spelt *Sãn* or *Saan*) – Bushman.

Greenberg distinguished South African Khoisan (with the major Northern, Central, and Southern branches) as opposed to the East African isolates Sandawe and Hadza (some 70 000 and 400 speakers, respectively). These views are not unanimously accepted, as genetic relatedness between the major linguistic branches cannot be proved satisfactorily. Although scholars remain divided on the issue of genetic relatedness, the term 'Khoesan' or 'Khoisan' (more correctly spelled 'Khoesaan') is now widely used as a term of convenience to denote all non-Bantu and non-Cushitic click languages of Southern and Eastern Africa.

Only some 30 Khoesaan languages still exist today, with the great majority of languages being extinct.

Khoesaan Languages

W H G Haacke, University of Namibia, Windhoek, Namibia

The recognition of Khoisan (Khoesaan) as one of the four language phyla in Africa received initial impetus mainly through the 'Macro-Khoisan Hypothesis' of Joseph Greenberg, first published in 1950. This controversial phylum comprises his 'Click languages,' which formerly were known as 'Hottentot' and 'Bushman' languages, respectively. Dorothea Bleek (1929) had paved the way for their integration into one family by challenging the prevalent view that Hottentot as a Hamitic language had been influenced by Bushman, and by suggesting instead that Nama (as representative of Hottentot) was a Bushman language with Hamitic admixture. Bleek divided the Bushman languages into Northern, Central, and Southern groups. In essence, these divisions are still recognized today, although their validity is open to challenges (see Table 1).

The compounded name Khoisan was coined in 1928 by Leonhardt Schultze to signify the somatoracial relatedness of the Hottentots and Bushmen, with *khoi* ('human being,' correctly spelled *khoe*) representing Hottentot, and *san* – the Nama designation for the Bushmen, meaning 'foragers' (correctly spelt *Sān* or *Saan*) – Bushman.

Greenberg distinguished South African Khoisan (with the major Northern, Central, and Southern branches) as opposed to the East African isolates Sandawe and Hadza (some 70 000 and 400 speakers, respectively). These views are not unanimously accepted, as genetic relatedness between the major linguistic branches cannot be proved satisfactorily. Although scholars remain divided on the issue of genetic relatedness, the term 'Khoesan' or 'Khoisan' (more correctly spelled 'Khoesaan') is now widely used as a term of convenience to denote all non-Bantu and non-Cushitic click languages of Southern and Eastern Africa.

Only some 30 Khoesaan languages still exist today, with the great majority of languages being extinct.

4.	†Kwadi (Angola)
5.	Sandawe (Tanzania)

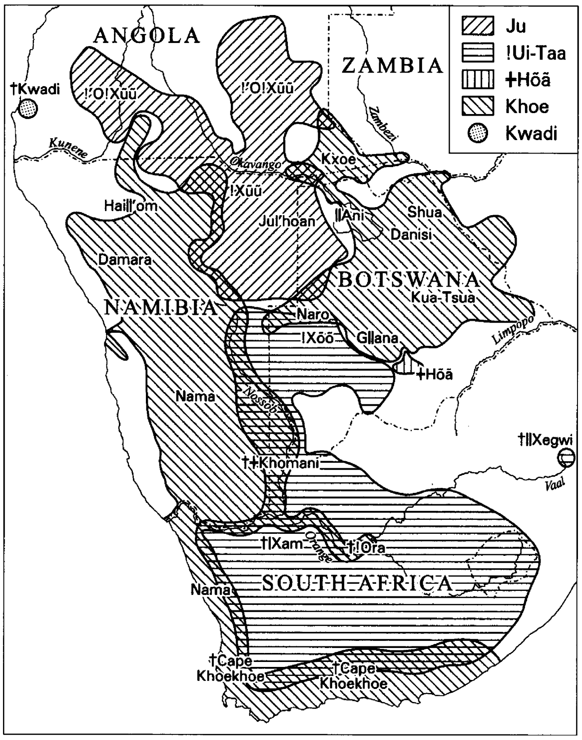

Figure 1 South African Khoesaan languages (precolonial situation). (Note: '†' = language now extinct.) Map reproduced with kind permission of Cambridge University Press from Güldemann T & Vossen R (2000). 'Khoisan.' In Heine B & Nurse, D (eds.). *African languages: an introduction.* Cambridge: Cambridge University Press. 100, map 5.5.

With the possible exception of Khoekhoegowab in Namibia (formerly better known as 'Nama,' and for classificatory purposes briefly referred to as 'Khoekhoe'), virtually all of these languages can be considered to be endangered.

While the Northern (*Ju*) and Southern (*!Ui-Taa*) branches with the isolate ‡Hôâ are spoken by hunter-gatherers (Bushmen/Saan), the languages of the Central branch (*Khoe*) are today spoken by Khoeid (Nama; !Gora/!Ora, Xri, and Cape Khoekhoe being extinct), Saaid (of especially the Kalahari Khoe branch), and Negroid (Damara) peoples. Linguistic and racial classifications of these groups are thus not coextensive. The following classification is largely based on the classifications of Köhler (1989) and of Güldemann and Vossen (2000). The reader is referred to the latter publication for more detailed information on Khoesaan languages. For a classification of !Xung and Jul'hoan dialects (Northern Khoesaan) see Snyman (1997), for Central Khoesaan see Voßen (1997), and for dialects of Khoekhoe(gowab) Haacke *et al.* (1997). Several of the language names below represent dialect clusters (DCs). The iconic classificatory names *Ju*, *!Ui*, *Taa*, and *Khoe* mean 'human being' in their respective branches. The now extinct Kwadi was probably related to Namibian Khoekhoe. Although Sandawe does show evidence of affinity to Central Khoesaan, *i.a.* also in its tonology, recent research by Bonny Sands (1998b) considers Hadza of Tanzania to be an isolate with no satisfactory evidence for a genetic relationship to Khoesaan, despite lexical similarities and the use of clicks (Figure 1).

Before the Bantu diaspora, Khoesaan peoples probably inhabited the entire Southern Africa up to the east coast of South Africa and into southern Angola. Displacement and absorption led to a drastic reduction of territorial domains, which was further aggravated by the arrival of European colonizers in the seventeenth century. Social marginalization still determines the life of all groups considered to be Saan. Khoekhoegowab in Namibia is the only Khoesaan language that is officially recognized for language-planning purposes and is a major subject at university level. Demographic figures are largely based on estimates, totalling over 200 000 for Southern African Khoesaan. Khoekhoe(gowab), with 175 554 speakers (1991 census of Namibia), represents by far the largest Khoesaan speech community and constitutes some 12.5% of the Namibian population.

The most conspicuous phonological characteristic of Khoesaan languages is the use of click consonants (Table 2). Clicks consist of an influx and an efflux phase. The influx (basic click) produces the actual

Table 2 The 20 click variants of Khoekhoegowab

Influx	*Efflux*				
	Glottal stop	*Voiceless velar stop*	*Delayed glottal fricative*	*Voiceless velar affricate*	*Voiced nasalization*
Dental ǀ	[ǀʔ]	ǀg [ǀ]	ǀh [ǀɦ]	ǀkh [ǀx^h]	ǀn [ŋǀ]
Alveolar	! [!ʔ]	!g [!]	!h [!ɦ]	!kh [!x^h]	!n [ŋ!]
Palatal	ǂ [ǂʔ]	ǂg [ǂ]	ǂh [ǂɦ]	ǂkh [ǂx^h]	ǂn [ŋǂ]
Lateral	ǁ [ǁʔ]	ǁg [ǁ]	ǁh [ǁɦ]	ǁkh [ǁx^h]	ǁn [ŋǁ]

Table 3 The six main citation melodies of Khoekhoegowab and their sandhi correlates (as recorded by Eliphas Eiseb)

Citation	*Sandhi*	*Gloss*
!òm̀s	*!òm̏s*	to butt
!ȍḿs	*!ȍḿs*	female genitals, udder
!òm̀s	*!òm̀s*	to force escape from burrow (of: aardvark)
!óm̀s	*!òm̏s*	to coagulate;
		to remove thorn with aid of utensil
!óḿs	*!óm̀s*	fist
!òm̋s	*!òm̀s*	pollard

clicking sound and is produced without pulmonic airstream. There are five influx variants: ⊙ (bilabial), ǀ (dental), ! (alveolar), ǂ (palatal), and ǁ (lateral). Each of these influxes then combines with a specific number of effluxes, depending on the language. This efflux constitutes the resumption of the pulmonic egressive airstream, and its nature depends on the manner of release of the posterior, velaric (and at times glottalic) closure. The bilabial 'kiss-click' ⊙ is manifest only in Southern Khoesaan. The number of effluxes can vary from five in Khoekhoe(gowab) to 16 in !Xõõ, yielding a total of 83 click variants in the latter language, with a total of 117 consonants (cf. Traill, 1985) – a possible world record.

The tonology of Central Khoesaan languages is typologically most akin to those of Southeast Asian languages on account of perturbational (sandhi) processes and the interaction of tonal and segmental phonemes, with depressor consonants triggering tonogenesis (development of contrastive pitch as compensation for the depletion of consonantal contrasts).

According to research thus far, available roots in Khoesaan languages appear to be generally bimoraic. Roots of at least Central Khoesaan languages are disyllabic, with syllable and mora being in isomorphic relation; hence tonal melodies (**Table 3**) consist of a sequence of two register (level) tonemes. The following minimal set illustrates the six main melodies of Khoekhoegowab in citation and sandhi form (Haacke, 1999. The second syllable of *!om* consists of a syllabic nasal [m]. Verbs are quoted here in their infinitival form with the third person fem. sg. pgn-marker *s*). Vowel qualities generally vary between oral and nasalized vowels; in addition, pharyngealized, laryngealized, and breathy vowels or their combinations are found in most non-Khoekhoe languages.

The most distinctive morphological characteristic of Central Khoesaan languages is that they mark nouns for sex gender with postclitic person–gender–number markers, whereas Northern and Southern languages do not. This occurs most consistently in Khoekhoegowab, which marks nouns for person (third, as well as first or second), gender (masculine, feminine, neuter/common), and number (singular, dual, and plural). Non-Central languages have little inflectional morphology. Whereas Non-Central languages have SVO constituent order, Central languages have SOV order in the case of lexically specified NPs.

Khotanese

P O Skjærvø, Harvard University, Cambridge, MA, USA

Khotanese, an Eastern Middle Iranian language spoken in the kingdom of Khotan in southwestern Xinjiang, is known from manuscripts on paper and wood found in the Khotan area, as well as in the caves at Dunhuang. The related language Tumshuqese, spoken in Kucha in northwestern Xinjiang, is much less well known. They were written in the southern and northern variants of Brahmi, respectively.

Three stages of Khotanese can been distinguished: Old, Middle, and Late, corresponding to texts from, roughly, the 5th–6th, 7th–8th, and 9th–10th centuries, up to the end of Buddhism in Khotan (ca. 1000).

Written remains consist mainly of Buddhist texts from all three periods, economical and legal documents from the Middle Khotanese period, and letters from the Late Khotanese period.

Khotanese and Tumshuqese contitute the northeastern branch of the Iranian languages, in which Indo-Iran. *ćw, ʒ́w* [tʃw, dʒw] became *ś* [ʃ], *ź* [ʒ]. This feature is only shared by modern-day Wakhi spoken in northeastern Afghanistan.

The phonology of Khotanese is of the Middle Iranian type in which, for instance, *č* [tʃ] and *ǰ* [dʒ], spelled *c* and *j*, had become [ts] and [dz], spelled *tc*, and *js* in the Brahmi alphabet. There are two non-Indic vowel marks, transcribed as *-ä* ([-ə]?) and *-ei*.

Khotanese had retroflex consonants (*ṭ, ṭh, ḍ, ṇ*) in both indigenous words (in which, e.g., *ḍ* < *rd*, *ṇ* < *žn*) and in Indic loanwords. It is not clear whether the aspirated stops, *kh*, etc., were spirants [x], etc., or actually aspirated stops [k^h], etc. It is possible that they were originally spirants, as in other Iranian languages (cf. Khot. *khara-* 'donkey,' Avestan *xara-*, Persian *xar*, etc.), and only later became stops, as suggested by the way Chinese was written in Brahmi in Khotan.

The non-Indic sound *z* was written *ys*. The voiced sibilants *ź* and *ž* were originally not distinguished in writing from *ś* and *ṣ*, but later various strategies for distinguishing them were invented (written double = unvoiced, single = voiced; a subscript curved line (transliterated as ') to indicate the voiced pair; e.g., *śärä* and *śśärä* [*śərə*] 'good,' but *śätä* [*źədə*], *śe* [*źe*] 'second'); the line also probably indicated rhotasized vowels (*nei* [*nei*^{r}] 'nectar' < **nāžā*). There was a single-flap *r* and a trilled *r*.

While intervocalic voiced stops had already been lost in Old Khotanese, intervocalic *k* and *t* still remained in the oldest texts (phonemically *g* and *d*), and final *-i*, *-ä*, and *-u* were still distinct. The development from Old via Middle to Late Khotanese in the

Khotanese

P O Skjærvø, Harvard University, Cambridge, MA, USA

Khotanese, an Eastern Middle Iranian language spoken in the kingdom of Khotan in southwestern Xinjiang, is known from manuscripts on paper and wood found in the Khotan area, as well as in the caves at Dunhuang. The related language Tumshuqese, spoken in Kucha in northwestern Xinjiang, is much less well known. They were written in the southern and northern variants of Brahmi, respectively.

Three stages of Khotanese can been distinguished: Old, Middle, and Late, corresponding to texts from, roughly, the 5th–6th, 7th–8th, and 9th–10th centuries, up to the end of Buddhism in Khotan (ca. 1000).

Written remains consist mainly of Buddhist texts from all three periods, economical and legal documents from the Middle Khotanese period, and letters from the Late Khotanese period.

Khotanese and Tumshuqese contitute the northeastern branch of the Iranian languages, in which Indo-Iran. *ćw, ʹjw* [tʃw, dʒw] became *ś* [ʃ], *ź* [ʒ]. This feature is only shared by modern-day Wakhi spoken in northeastern Afghanistan.

The phonology of Khotanese is of the Middle Iranian type in which, for instance, *č* [tʃ] and *ǰ* [dʒ], spelled *c* and *j*, had become [ts] and [dz], spelled *tc*, and *js* in the Brahmi alphabet. There are two non-Indic vowel marks, transcribed as *-ä* ([-ə]?) and *-ei.*

Khotanese had retroflex consonants (*ṭ, ṭh, ḍ, ṇ*) in both indigenous words (in which, e.g., *ḍ* < *rd*, *ṇ* < *žn*) and in Indic loanwords. It is not clear whether the aspirated stops, *kh*, etc., were spirants [x], etc., or actually aspirated stops [k^h], etc. It is possible that they were originally spirants, as in other Iranian languages (cf. Khot. *khara-* 'donkey,' Avestan *xara-*, Persian *xar*, etc.), and only later became stops, as suggested by the way Chinese was written in Brahmi in Khotan.

The non-Indic sound *z* was written *ys*. The voiced sibilants *ź* and *ž* were originally not distinguished in writing from *ś* and *ṣ*, but later various strategies for distinguishing them were invented (written double = unvoiced, single = voiced; a subscript curved line (transliterated as ') to indicate the voiced pair; e.g., *śärä* and *śśärä* [*śərə*] 'good,' but *śätä* [*źədə*], *śe* [*źe*] 'second'); the line also probably indicated rhotasized vowels (*nei* [*nei*^{r}] 'nectar' < **näžä*). There was a single-flap *ɾ* and a trilled *r*.

While intervocalic voiced stops had already been lost in Old Khotanese, intervocalic *k* and *t* still remained in the oldest texts (phonemically *g* and *d*), and final *-i*, *-ä*, and *-u* were still distinct. The development from Old via Middle to Late Khotanese in the

main involved the loss of distinction between final short vowels and their loss after nasals and in some other positions (e.g., Okhot. *aysu* 'I' > MKhot. *aysä*, LKhot. *a*; OKhot. NOM/ACC *suhāvatānä/u* 'utilities' > MKhot. *suhāvāṃ* > LKhot. *suhāvau*); and the merger of *uṃ* and *āṃ* (e.g., OKhot. GEN-DAT PL *rruṃdänu* 'the kings' > MKhot. *rrāṃdāṃ* > LKhot. *rraudau* [approx. [rɔːdɔː]).

The original six-case system is reduced in Middle Khotanese by the merger of the nominative and accusative (except in pronouns), and further reduced in Late Khotanese to a three- or two-case system. There are three genders, the neuter being of limited use.

The verbal system is of the Eastern Middle Iranian type. There are two stems, present and past (e.g., PRES *bar-*, PAST *buḍa-*; PRES *häm-* 'become,' PAST *häm-äta-*). Khotanese has preserved the Old Iranian moods (indicative, imperative, subjunctive, optative, injunctive), as well as active and middle. The past of intransitive verbs is of the common Iranian type (*buḍ-ä mä* 'carry.PAST.INTRANS-SING.MASCCOP.PRES.1ST.SING' = 'I was carried' > 'I rode'), while that of transitive verbs is based on an active past participle plus copula (*buḍ-e* < **bṛta-āh* 'carry.PAST.TRANS-SING.MASC [COP. 3RD.SING = Ø]' = 'he carried,' *buḍ-ātä* 'she carried'; *buḍ-aimä* < **bṛta-āh ahmi* [COP.PRES.1ST. SING] 'I [MASC] carried,' *buḍāndä* 'they carried,' *buḍ-āndä mä* [COP.PRES.1ST.PL] 'we carried').

Perfect/pluperfect and modal forms are formed from the past tense (e.g., perfect: *nei* [<*ne* + *ī*] *hvat-e śtä balysä* 'NEG-EMPH.PART speak.PAST.TRANS.-SING. MASC COP.3RD.SING Buddha-SING.NOM' = 'the Buddha has not at all said'; pluperfect: *cīyä rr-e bäysānd-ä vät-ä* 'when king-SING.NOM awaken.PAST. INTRANS-MASC COP.PAST.INTR-3RD.SING-MASC' = 'when the king had awakened'; pluperfect optative: *ka nä va ysār-u gyast-a balys-a dāt-u hvat-āndä v-ī-ro ne gāvu vamas-īro* 'if they.ENCL.OBL PARTICLE 1000. SING.NEUT lord.PL.NOM-ACC buddha.PL.-NOM-ACC law. SING.ACC speak.PAST.TRANS-PL.MASC/FEM COP-OPT-3RD.PL NEG at-all understand.OPT.3RD.PL' = 'even even if a thousand lord buddhas had spoken the law to them, they would not at all understand').

The 'potentialis' is formed with a past participle with the ending-*u* (SING ACC NEUT) and the verbs *yan-* 'to do' (active) and *häm-*'become' (passive) and expresses possibility and completion of action (e.g., *ne hvat-a häm-āre* 'NEG speak.PAST.PART-PLUR.MASC become.PRES.-3RD.PL' = 'they cannot be said/ expressed,' *ne hvat-u yan-īmä* 'NEG speak.PAST.PART. NEUT do.PRES-1ST.SING' = 'I cannot say (it),' *cīyä hvat-u yuḍ-āndä* 'when speak.PAST.PART.NEUT do.PAST.TRANS-3RD.PL = 'when they had spoken').

Tumshuqese also has the old augmented imperfect (e.g., *a-ch-i* 'PAST-go-3RD.SING' = 'he went, he has gone'), though the augment may be added only to monosyllabic forms (cf. *bar-i* 'he carried').

The lexicon contains numerous borrowings from Indic, both Middle Indic and Classical Sanskrit. In the Middle and Late Khotanese periods, we also find a small number of Chinese and Tibetan words.

Kiel/Kiliaan, Cornelis van (1530–1607)

L De Grauwe, Ghent University, Ghent, Belgium

Cornelis Abts alias van Kiele (he signed as C. Kiel or Cornelis van Kiel), the first great lexicographer of what is now the Dutch language, was born in Duffel (now in the Belgian province of Antwerp, then part of the Duchy of Brabant) not before 1530. His name was latinized into Kilianus (hence Modern Dutch Kiliaan). He may have studied law and the three Biblical languages at Louvain University. The book-keeping diary of the Antwerp printer and publisher Christophe Plantin mentions his name in February 1558 as a compositor and in 1565 as a corrector, which he was to remain until his death on Easter Sunday, April 15, 1607.

Apart from this work, Plantin charged him with translations into Dutch of grammars and dictionaries, e.g., Robert Estiennes *Dictionarium Latinogallicum* (translated 1564; edition now lost); the Dutch section in the anonymous *Dictionarium Tetraglotton*

main involved the loss of distinction between final short vowels and their loss after nasals and in some other positions (e.g., Okhot. *aysu* 'I' > MKhot. *aysä*, LKhot. *a*; OKhot. NOM/ACC *suhāvatānä/u* 'utilities' > MKhot. *suhāvāṃ* > LKhot. *suhāvau*); and the merger of *uṃ* and *āṃ* (e.g., OKhot. Kiel/Kiliaan, Cornelis van (1530–1607)

L De Grauwe, Ghent University, Ghent, Belgium

Cornelis Abts alias van Kiele (he signed as C. Kiel or Cornelis van Kiel), the first great lexicographer of what is now the Dutch language, was born in Duffel (now in the Belgian province of Antwerp, then part of the Duchy of Brabant) not before 1530. His name was latinized into Kilianus (hence Modern Dutch Kiliaan). He may have studied law and the three Biblical languages at Louvain University. The bookkeeping diary of the Antwerp printer and publisher Christophe Plantin mentions his name in February 1558 as a compositor and in 1565 as a corrector, which he was to remain until his death on Easter Sunday, April 15, 1607.

Apart from this work, Plantin charged him with translations into Dutch of grammars and dictionaries, e.g., Robert Estiennes *Dictionarium Latinogallicum* (translated 1564; edition now lost); the Dutch section in the anonymous *Dictionarium Tetraglotton*

(Latin–Greek–French–Dutch) edited by Plantin in 1562 was probably also Kiliaan's work. At Plantin's instigation, Kiliaan began to apply himself to a concise *Dictionarium Teutonico-Latinum* (edited in 1574, 240 pp.), starting from his own 'vernacular' mother tongue and comparing the words with their German and French equivalents *(Dictiones Latinè interpretatas, seduloque Germanicis & Gallicis collatas)*. Here at least, *Teutonicus* means 'Dutch,' not 'German' as in some other dictionaries and many other sources of the period – Dutch and German still being regarded as closely related varieties in a single, if internally differentiated, continuum of regional, continental West Germanic '*Schreibsprachen*' (written language variants) that extended from the North and Baltic Seas to the Alps. Kiliaan's lexical basis is his own Brabant (Southern Central Dutch) 'language,' of which he was rather proud, not least because it was spoken in an important region that included cities such as Brussels, Antwerp and Louvain (Leuven). His innovative dictionary, of which only two copies survive, laid the foundation for the modern scientific lexicography of Dutch and indeed for that of all the Western European languages. This is even more true of the two subsequent, much expanded editions. The first of these was the *Dictionarium Teutonico–Latinum* (1588; 765 + 3 pp.), in which Kiliaan included not only additional etymological information but also English, Saxon (= Lower German, Niederdeutsch), Spanish, Italian, and Greek translations as well as new lexical entries from all the Dutch-speaking provinces of the historical Netherlands before their *de facto* separation in 1585 (now 'Holland' and 'Flanders,' the latter constituting northern Belgium). Regional usage is marked by abbreviations such as *fland., holl., fris.* (i.e., used in Flanders, Holland, Friesland); *sic.* stands for *Sicambri,* denoting the people in Gelderland, Kleve, and Jülich, border regions speaking a dialect closely reated to Dutch that now belong entirely or partly to Germany. The third edition, entitled *Etymologicum teutonicae linguae* (1599), is yet further enlarged and in its title reflects the increasing attention paid to etymology. Despite his great merits, Kiliaan remained a child of his time: many of his etymologies are prescientific, and he was a compiler in the literal sense – i.e., a plunderer. In all three editions of his greatest work he tapped into a wide variety of earlier sources, often uncritically, though in the last two editions he did cite them explicitly in an attempt to derive *auctoritas* for himself. Other works by Kiliaan are translations of geographical and historical descriptions and some Latin poems, some of them intended to accompany engravings; from 1574 onward, he also worked as a much-sought-after translator for the Antwerp and Brabant authorities.

Kilwardby, Robert (ca. 1215–1279)

E Bell Canon, Social Circle, Athens, GA, USA

Robert Kilwardby was born in Leicestershire, England ca. 1215. Beginning in 1231, Kilwardby was a student at the University of Paris, which was considered to be one of the greatest centers of learning in the medieval world. Later, Kilwardby was a master at the University of Paris at a time when debate over Aristotelian philosophy began to divide the church. He was a distinguished teacher of grammar and logic. "In grammar he expounded *Priscianus minor, De accentu* and the *Barbarismus Donati,* covering syntax, prosody, solecism and figurative speech." (Lewry, p. xiv). As a teacher, he paid particular attention to the use of syllogisms in the teaching of logic.

His studies took him from Paris to Oxford, where he ultimately became a master in theology in 1256. He joined the Dominican order as a friar. The Oxford Dominicans divided their studies into two branches: theological studies and philosophical studies. Kilwardby devoted himself to theological subjects

(Latin–Greek–French–Dutch) edited by Plantin in 1562 was probably also Kiliaan's work. At Plantin's instigation, Kiliaan began to apply himself to a concise *Dictionarium Teutonico-Latinum* (edited in 1574, 240 pp.), starting from his own 'vernacular' mother tongue and comparing the words with their German and French equivalents *(Dictiones Latinè interpretatas, seduloque Germanicis & Gallicis collatas)*. Kilwardby, Robert (ca. 1215–1279)

E Bell Canon, Social Circle, Athens, GA, USA

Robert Kilwardby was born in Leicestershire, England ca. 1215. Beginning in 1231, Kilwardby was a student at the University of Paris, which was considered to be one of the greatest centers of learning in the medieval world. Later, Kilwardby was a master at the University of Paris at a time when debate over Aristotelian philosophy began to divide the church. He was a distinguished teacher of grammar and logic. "In grammar he expounded *Priscianus minor, De accentu* and the *Barbarismus Donati,* covering syntax, prosody, solecism and figurative speech." (Lewry, p. xiv). As a teacher, he paid particular attention to the use of syllogisms in the teaching of logic.

His studies took him from Paris to Oxford, where he ultimately became a master in theology in 1256. He joined the Dominican order as a friar. The Oxford Dominicans divided their studies into two branches: theological studies and philosophical studies. Kilwardby devoted himself to theological subjects

almost completely (*De ortu scientiarum*, a basic summary of human science, being the great exception). In order to simplify the research process, he created a detailed set of indices, both alphabetical and analytical, and a set of chapter summaries of the works of Augustine.

In 1261, Kilwardby was elected Provincial Prior of his order, a post he held until 1272. On October 11, 1272, he was appointed Archbishop of Canterbury by Pope Gregory X. He was noted for being charitable to both the poor and the members of his order, giving the necessary money to establish housing for the Blackfriars in London.

In March of 1277, Kilwardby visited Oxford and issued a condemnation of 30 propositions in grammar, logic, and natural science taught there at the time. As a former teacher of logic and grammar, he judged the propositions to be erroneous in nature. The fault, as Kilwardby saw it, was in both the Averroist nature of the propositions and the method of teaching them. Kilwardby was on the Augustinian end of the logic dichotomy that had been seen earlier at the University of Paris. It was not his intention to denounce the propositions as heretical, only to prevent the teaching of them. Kilwardby's condemnations came just days after Etienne Tempier, Bishop of Paris, condemned 219 propositions dealing with Averroist philosophy, advancing the more Christian, Augustinian version of logic taught in the universities.

Pope Nicholas III appointed Kilwardby Cardinal-Bishop of Porto and Santa Rufina on April 4, 1278. Kilwardby was accused of having left Canterbury with church registers and a considerable amount of money. He died in Viterbo, Italy on September 11, 1279. Soon thereafter, the suspicion arose that he had been poisoned, since the money and records were never recovered.

Other works by Kilwardby include *De Tempore*, an inquiry into the nature of time in which the author attempts to reconcile differences between Aristotelian philosophy and Augustinian Christianity, with regard to time and eternity; and *De Universali*.

Kimatuumbi: Phonology

D Odden, Ohio State University, Columbus, OH, USA

Kimatuumbi is a Bantu language spoken by approximately 60 000 people in Kilwa District of Tanzania. It is a part of the Rufiji-Ruvuma subgroup in the Nurse (1988) classification, designated P13 in Guthrie (1971). General characteristics of the Rufiji-Ruvuma languages are discussed in Odden (2003). As is typically the case in Bantu languages, most phonological processes in the language pertain to prosody – tone, vowel length, and syllable structure – with a bit of segmental phonology regarding vowel harmony and nasal + consonant sequences.

Aspects of Kimatuumbi phonology have been discussed in various publications, for instance Cowper and Rice (1987), Hayes (1990), Odden (1987, 1990), Truckenbrodt (1999), focusing particularly on theoretical consequences of certain phrasal sandhi rules of the language, as well as Rosenthall (1994) discussing vowel sequences. Odden (1996) provides a comprehensive overview of the morphology and phonology of the language.

Segmental Inventory

The 'core' segmental phonemes of the language are as follows:

(1)	p	t	č	k	i		u
	b			g	ɪ		ʊ
	m	n	ñ	ŋ	ɛ		ɔ
	w	l	y			a	

almost completely (*De ortu scientiarum,* a basic summary of human science, being the great exception). In order to simplify the research process, he created a detailed set of indices, both alphabetical and analytical, and a set of chapter summaries of the works of Augustine.

In 1261, Kilwardby was elected Provincial Prior of his order, a post he held until 1272. On October 11, 1272, he was appointed Archbishop of Canterbury by Pope Gregory X. He was noted for being charitable to both the poor and the members of his order, giving the necessary money to establish housing for the Blackfriars in London.

In March of 1277, Kilwardby visited Oxford and issued a condemnation of 30 propositions in grammar, logic, and natural science taught there at the time. As a former teacher of logic and grammar, he judged the propositions to be erroneous in nature. The fault, as Kilwardby saw it, was in both the Averroist nature of the propositions and the method of teaching them. Kilwardby was on the Augustinian end of the logic dichotomy that had been seen earlier at the University of Paris. It was not his intention to denounce the propositions as heretical, only to prevent the teaching of them. Kimatuumbi: Phonology

D Odden, Ohio State University, Columbus, OH, USA

Kimatuumbi is a Bantu language spoken by approximately 60 000 people in Kilwa District of Tanzania. It is a part of the Rufiji-Ruvuma subgroup in the Nurse (1988) classification, designated P13 in Guthrie (1971). General characteristics of the Rufiji-Ruvuma languages are discussed in Odden (2003). As is typically the case in Bantu languages, most phonological processes in the language pertain to prosody – tone, vowel length, and syllable structure – with a bit of segmental phonology regarding vowel harmony and nasal + consonant sequences.

Aspects of Kimatuumbi phonology have been discussed in various publications, for instance Cowper and Rice (1987), Hayes (1990), Odden (1987, 1990), Truckenbrodt (1999), focusing particularly on theoretical consequences of certain phrasal sandhi rules of the language, as well as Rosenthall (1994) discussing vowel sequences. Odden (1996) provides a comprehensive overview of the morphology and phonology of the language.

Segmental Inventory

The 'core' segmental phonemes of the language are as follows:

(1)	p	t	č	k	i		u
	b			g	ɪ		ʊ
	m	n	ñ	ŋ	ɛ		ɔ
	w	l	y			a	

Additional phonemes with restricted distribution exist. Surface [d] is common but nearly always preceded by a nasal, e.g., [kyʊ́undɔ̀] 'knot' where it is in complementary distribution with [l]. Since *d* exists in a few words not preceded by a nasal, e.g., [daámu] 'blood,' [diíwai] 'wine,' it must be granted marginal phonemic status. The voiced consonants written *b, d, g* are pronounced as implosive [ɓ ɗ ɠ] when not preceded by a nasal, thus more narrowly [ɗaámu], [ɓɔ̀na] 'to see,' [ɠálaambuka] 'to change.' Phonetic [ǰ] exists only after a nasal ([ñǰíiŋgiilɛ] 'I entered'), in complementary distribution and morphophonological alternation with the implosive palatal [ʄ] ([ʄ'iiŋgya] 'to enter.') Surface [ʄ'] itself is almost always limited to root-initial position before the vowel [i], and there it is in free variation with [y], hence [yíiŋgya] 'to enter.' It does also appear elsewhere in a few loan words, such as [ʄ'aáʄ'i] 'judge.' Other restricted phonemes are [v], [f], [z], and [r], which only appear in loanwords ([zaábu] 'gold,' [kɔlɔfiíndɔ] 'walking stick,' [ɗɛrɛ́va] 'driver.'

The consonant transcribed as [č] may be pronounced [č], [tˢ] or [s]. Some speakers appear to always use [s], whereas others tend more toward [č]. In addition, there are lexical preferences (but not requirements) for [s] vs. [č], where [suuŋgulá] 'rabbit' tends to be pronounced with [s] and [čaáŋgu] 'mine' tends to have [č]: but, [čuuŋgulá] and [saáŋgu] are sometimes used. Words such as [suuŋgulá] are mostly loanwords and reflect the original Swahili consonant (*sungura*).

To simplify transcriptions, the implosive/nonimplosive variants are not noted because they are predictable, and the voiced palatal obstruent is written [j]. Since there is no contrast between [e o] and [ɛ ɔ], the mid vowels are written as [e o]. For the sake of comparing data presented here with that published elsewhere, [ɪ ʊ] here correspond to [i u] elsewhere, while [i u] here correspond to [i̧ u̧] used elsewhere, the latter using the traditional Bantuist diacritic for the 'superhigh' vowels. Finally [ŋ] will be used here rather than [n'] found elsewhere.

Vowel length is distinctive, and is indicated by doubling the vowel. The language has H and L tones, which phonologically functions as a H-toned versus toneless distinction. The interpretation of tone marks is as follows, using [a] to represent any vowel:

(2)	á	a	aa	áa	aá
	short H	short L	long L	long fall	long rise

All contour tones appear on long vowels, and there are no level-H long vowels except in one lexical item [sáána] 'very,' which derives from Swahili, and certain cases of vowel contractions.

Syllable Structure

Syllables in Kimatuumbi never have a coda consonant, except in a few loan words ([boóksi] 'box,' [bakteéliya] 'bacteria'). There are also no diphthongs, i.e., bivocalic syllable nuclei, in the language: vowel sequences such as [ui], [oi], [ai], [ao], etc., are disyllabic, thus [tá.u.na] 'to chew' has three light syllables. There are numerous lines of evidence showing the lack of diphthongs discussed in Odden (1996). One relevant example is that such sequences do not trigger the tone rule Heavy Retraction where /u.kaa.té/ becomes [u.kaá.te] 'you should cut,' as shown by [u.ta.u.né] 'you should chew,' not *[u.ta.ú.ne], since there is no preceding heavy syllable.

Consonant onsets conform to the pattern NCG, N standing for nasal, C standing for any consonant, and G standing for glide. Any of these elements is optional. The following data illustrate the onset possibilities.

(3)	No onset	áka	'net-hunt'
	C-onset	bendeéla	'flag'
		yʊ́ba	'hide'
		maána	'meaning'
	CC-onset	bwiími	'greed'
		kyaátí	'valley farm'
		mbaángo	'warthog'
		mméya	'white ant'
		mwaábí	'sorcerer'
	CCC-onset	mbweégá	'side'

Segmental Phonology

The main segmental processes of Kimatuumbi pertain to N + C sequences and vowel height harmony: additional processes of *l*-insertion, *b*- and *g*-deletion, and glide deletion are discussed in Odden (1996, Sect. 3.3–7).

NC Interactions

Kimatuumbi is somewhat unusual among Bantu languages in having two distinct sets of phonological alternations affecting nasal plus consonant sequences, which ultimately relates to the derivational source of the NC sequence. NC sequences arise directly by morpheme concatenation involving the class 9–10 noun prefix /ñ/ or via a rule optionally reducing the 1sg pronoun prefix /ni/ to *n*, triggering changes which are referred to as *n*-type alternations. A partially distinct set of alternations arise from the optional or obligatory reduction of various prefixes of the form /mu/ to just a nasal, which are referred to as *mu*-type alternations. The different processes are summarized in (4).

(4)

underlying *consonant*	n	mu — *Interaction type*
p,t,č,k	[mb,nd,ñǰ,ŋg]	[mp,nt,ñč,ŋk]
b,d,l,j,g,l	[mb,nd,nd,ñǰ,ŋg]	[mm,nn,nn,ññ,ŋŋ]
m,n,ñ,ŋ	[m,n,ñ,ŋ]	[mm,nn,nn,ññ,ŋŋ]
w,y	[ŋgw,ñǰ]	[ŋŋw, ññ]

Common properties transcending the two nasal classes include place assimilation, and approximant-hardening where [w l y] become [gw, d, ǰ]. The types of nasals are differentiated in terms of whether they trigger postnasal voicing (the *n*-type nasal does), postnasal nasalization (the *mu*-type nasal does), or degemination (the *n*-type nasal does). Examples of these processes are given below: n-type alternations are illustrated using the 1sg perfective verb and the mu-type use the 2pl perfective: the optional unreduced 1sg and 2pl variants motivate the underlying consonant.

(5)

n-type *1sg subject*		mu-type *2pl subject*		
ni-téliike	n-déliike	mu-téliike	n-téliike	‘cook’
ni-bwéeni	m-bwéeni	mu-bwéeni	m-mwéeni	‘see’
ni-nóolite	nóolite	mu-nóolite	n-nóolite	‘sharpen’
ni-wíile	ŋ-gwíile	mu-wíile	ŋ-ŋwíile	‘die’

Vowel Harmony

As in most Bantu languages, vowel coocurrence is most free in root-initial position, and is highly restricted within the stem thereafter. Only underlying /a i u/ are found in postinitial position, and are subject to height harmony whereby /i/ becomes [e] after [o e], [ɪ] after [ɪ ᴜ], and /u/ becomes [o] [o] (but not [e], and [ᴜ] appear after [ɪ ᴜ]. The high vowels [i u] then appear elsewhere. An illustration of the pattern with the causative suffix /iy/ is seen below.

(6)

plain	*causative*	
čáag-a	čáag-iy-a	‘grind’
ín-a	in-iy-a	‘dance’
kᴜ́n-a	kᴜ́n-iy-a	‘grate’
číinj-a	číinj-iy-a	‘slaughter’
ᴜ́ᴜg-a	ᴜ́ᴜg-Iy-a	‘bathe’
bóol-a	bóol-ey-a	‘de-bark’
čéeŋg-a	čéeŋg-ey-a	‘build’

Examples with the vowel /u/ harmonizing in the second syllable include [bᴜ́tuka] ‘run,’ [típuka], ‘pound to flour’ [čápuka] ‘get soiled,’ [tᴜ́ᴜmbᴜka] ‘fall,’ [pílᴜka] ‘trip over,’ [épuka] ‘avoid’ [bómoka] ‘be destroyed.’

Hiatus Resolution

Like many Bantu languages, Kimatuumbi has phonological processes that eliminate vowel sequences, but unlike a language such as Kikerewe, which has absolutely no vowel sequences, elimination of vowel hiatus in Kimatuumbi is only partial. Many of the hiatus-eliminating strategies in the language are optional or are subject to restrictions on morphosyntactic domain: ultimately, quite a number of V + V sequences remain. One of the interesting concomitants of these rules is that the remaining vowel is compensatorily lengthened.

Glide formation affects prevocalic high vowels, and can be easily motivated in verb paradigms by combining subject or object prefixes plus a vowel-initial vs. consonant-initial roots.

(7)

Infinitive	*3p-V-past*	*1s-V-past*	*1p-V-past*
čón-a	ba-čón-ite	ni-čón-ite	tu-čón-ite
éleew-a	ba-éleew-ite	ny-eéleew-ite	tw-eéleew-ite
ᴜ́bᴜk-a	ba-ᴜ́bwiik-e	ny-ᴜᴜ́bwiik-e	tw-ᴜᴜ́bwiik-e
ᴜ́ᴜg-a	ba-ᴜ́ᴜg-ite	ny-ᴜ́ᴜg-ite	tw-ᴜ́ᴜg-ite
ák-a	ba-ák-ite	ny-aák-ite	tw-aák-ite
áam-a	ba-áam-ite	ny-áam-ite	tw-áam-ite
	2s-V-past		
	u-čón-ite	‘draw’	
	w-eéleew-ite	‘understand’	
	w-ᴜᴜ́bwiik-e	‘climb’	
	w-ᴜ́ᴜg-ite	‘bathe’	
	w-aák-ite	‘net-hunt’	
	w-áam-ite	‘emigrate’	

Glide formation is subject to a number of conditions. For example, it is optional in domain-medial syllables (see ‘Organization of Rules’ below), it does not affect long vowels (Odden, 1996: Sect. 4.1.1), it has a few lexical exceptions, and has complex tonal conditioning where H toned vowels do not undergo glide formation before a long vowel.

The second main hiatus-reduction process is Vowel Contraction, where /a+i/ and /a+u/ optionally become [ee] and [oo]. This rule only applies between prefixes or proclitics and prefixes, never involving a root-initial vowel. Examples of this involving /a/ in a subject or tense-aspect prefix, plus /i/, /u/ in a subject or object prefix can be used to motivate this process.

(8)

uncontracted	*contracted*		
ba-i-káatite	beekáatite	(ba- ‘they’, -i-‘it’)	‘they cut it (cl. 9)’
ba-u-káat-ite	bookáatite	(-u- ‘you’)	‘they cut you’
ka-i-bolá	keebolá	(ka- ‘when’)	‘when it (cl. 9) rotted’
ka-u-bolá	koobolá	(-u- ‘it (cl. 3)’)	‘when it (cl. 3) rotted’

Root-initial vowels do not undergo contraction, so [a-ínite] ‘he danced’ never becomes *[eénite]. Long [aa] also cannot contract: cf. [naa-i-káatite] ‘I cut it,’ *[nee-káatite].

Also falling in the category of hiatus-resolving strategies is the desyllabification of an underlying or derived syllabic nasal, with compensatory lengthening of the preceding vowel. Although most Bantu languages with contrastive vowel length have predictably long vowels before NC clusters, Kimatuumbi no

longer has such lengthening as part of its active phonology. Within roots, vowels are generally long before NC sequences, for example *áandika* 'to write,' *kύυmbwa* 'to beat,' *lisaambalá* 'hide.' Because vowel length within the stem is restricted to (approximately) the last three moras, short vowels are found before NC in words such as *yánjaaya* 'to turn something drying,' *simbasiímba* 'road,' *yύmbItIka* 'to be quick,' *lipúndugulu* 'fog.' Even so, there are cases of short vowels before NC within the last three moras: *kičénjele* 'cock's comb,' *lukóngobe* 'hardwood,' *nčongóma* 'thorn-tree,' *ntíndí* 'buttermilk.' There is also no active lengthening across morpheme boundaries, thus the noun class prefix vowel is not lengthened in *ki-ndoólo* 'sweet potato,' *ka-ngápa* 'little bog,' *tu-ndó* 'little buckets,' nor is there any lengthening at the phrasal level (*mbusi ngύlύ 'big grating stool,' kila ndó 'every bucket')*.

However, there is the **appearance** of lengthening before a class of NC clusters, namely those involving reduction of /mu/. As argued in Odden (1996: Sect. 4.1.7–8), this is because as an intermediate step in the derivation, /mu/ reduces to a syllabic (moraic) nasal, which then transfers its mora to a preceding vowel if there is one. The vowel-lengthening concomitant of reduction of *mu-* can be seen in (9). The examples in (9a) involve phrasal combinations of a verb plus a locative where the locative prefix /mu/ optionally reduces, and the examples in (9b) involve lengthening of the prefix *ka-* 'when' before the 2pl subject /mu/.

(9a)	agonjite mύ-kilíndıılo	~ agonjiteé ŋ-kilíndıılo
	'he slept in the guard house'	
	naatíkwiibiikámumipύkó	~naatíkwiibiikáammipúkó
	'I put them in the bags'	
(9b)	kamuteleká	~ kaanteleká 'while2pl.werecooking'
	kamukalaáŋga	~kaaŋkalaáŋga 'while 2pl. were frying'

Tone

Bantu languages typically have a number of restrictions on the surface and underlying placement of tone in a word, and Kimatuumbi imposes more than the usual distributional restrictions on words. A difference must be made between noun tone, which is lexical, and verb tone, which is purely predictable by reference to phonological and morphological factors.

Nouns

With very few exceptions, noun stems have at most a single underlyingly H-toned syllable, and the underlying position of H is noncontrastive within bimoraic syllables. What is striking about noun tone in Kimatuumbi is that on the surface, this highly restricted nature of tonal specifications is not obvious. Typical examples illustrating the divergence between underlying and surface tones are given in (10).

(10)	mpaká	'boundary'	/mu-paká/
	ntíndí	'buttermilk'	/mu-tíndi/
	mikóta	'canes'	/mi-kota/
	mbaká	'cat'	/ñ-paká/
	ndími	'tongues'	/ñ-límí/
	ñáma	'meat'	/ñama/
	ŋkaáte	'loaf'	/mu-kaaté/
	ntóopé	'handle'	/mu-tóope/
	mpúuŋga	'paddy'	/mu-puuŋga/
	mboópo	'machete'	/ñ-poopó/
	ndooñá	'lip-rings'	/ñ-tóoña/
	ŋguúbe	'pig'	/ñ-kuube/
	masípitaáli	'hospitals'	/ma-sipitaalí/
	nčímbılíılí	'drip'	/mu-čımbılíılı/
	sipitaáli	'hospital'	/sipitaalí/
	njeénjemá	'mosquito'	/ñ-čeenjéma/
	matóondolo	'steinbucks'	/ma-tóondolo/
	ndoóndolo	'steinbuck'	/ñ-tóondolo/
	kipıíkııtí	'piece of wood'	/ki-pııkíıtı/

One of the sources of opacity in the noun tone system is that while all nouns have a H tone in their citation form, the same is not true at the phrasal level. Compare the examples in (11a) with those in (11b).

(11a)	*N*	*'it's not N'*	
	ki-wíkılyo	ŋga ki-wıkılyo lí	'cover'
	mi-kóta	ŋga mi-kota lí	'sugar canes'
	ki-kóloombe	ŋga ki-koloombelí	'shell'
	ŋ-guύŋguni	ŋga ŋ-guuŋguni lí	'bedbug'
(11b)	lu-kóŋgobe	ŋga lu-kóŋgobe lí	'wood'
	ma-tógolo	ŋga ma-tógolo lí	'waterbucks'
	ki-kálaaŋgo	ŋga ki-kálaaŋgo lí	'pan'
	diíwai	ŋga diíwai lí	'wine'

Nouns such as the first set have no underlying H tone and those in the second group have an underlying H. This distinction is neutralized prepausally, by a rule assigning H to the second mora of the word to any toneless word in prepausal position. Words such as [ki-kóloombe], which have a CV noun class prefix, have their H on the first stem syllable: nouns with no moraic prefix such as [ŋ-guúŋguni] are what show that the correct generalization is 'second vowel of the word.'

Two rules assign additional H tones to a noun beyond the underlying lexical tone, whose operation contradicts the surface generalization that stems have only a single H. First, H is assigned to the root-initial mora when a mora-bearing noun class prefix – other than the class 5 prefix /li-/ – precedes the stem and the lexical H is not on the following syllable. A number of nouns allow both nonmoraic and moraic prefixes, which results in alternations in the tone of the root-initial syllable.

(12)	sipitaáli	‘hospital’	ma-sípitaáli	‘hospitals’
	bisikúti	‘biscuit’	ka-bísikúti	‘little biscuit’
	čwaakalá	‘lime’	ma-čwáakalá	‘pieces of lime’
	solokó	‘black beans’	lu-sólokó	‘black bean’

Examples such as *ma-paká* ‘cats,’ *ma-poópo* ‘machetes,’ where the root-initial mora precedes a H tone, illustrate the necessity of a toneless vowel between the target of H-insertion and the lexical H in the stem.

The second source of multiple H tones inside a stem is a Tone Copy rule that assigns H tone to the final vowel after a penultimate H tone. This rule only applies prepausally, so in certain phrase-medial positions, the final H will be lacking (because of a phrasal tone rule assigning H, discussed in ‘Phrasal Tone Insertion’ below, the typical phrasal context where the final H is surface absent is VP-medial).

(13)	lukópé	lukópe ...	‘eyelid’
	lulímí	lulímɪ ...	‘tongue’
	kikwɪkwíɪkwɪ	kikwɪkwíɪkwɪ ...	‘belch’
	lukóonjí	lukóonji ...	‘finger’
	lutebéelé	lutebéelé ...	‘amaranthus’

Besides restricting underlying H tones to one-per-stem, there is also no underlying contrast between rising and falling tones, even though such a distinction is made on the surface. In nouns, most rising tones come from the rule Heavy Retraction, where a H tone shifts leftward to a long vowel forming a rising tone. Since a phrasal sandhi rule shortens long vowels in phrase-medial position (see ‘Shortening’ below), the underlying position of the (unretracted) H tone can be detected relatively easily by including a modifier that induces vowel shortening.

(14)	mabiíbi	/ma-biibí/	‘grandmothers’
	kiboóko	/ki-bookó/	‘stick’
	asíkaáli	/a-sikaalí/	‘soldiers’
	kipílɪɪ́lɪ	/kipílɪɪlɪ́/	‘scorpion’
		mabibí gaángu	‘my grandmothers’
		kibokó kilaáso	‘long stick’
		asíkalí awaáá	‘dead soldiers’
		kipílɪlɪ́ɪ ŋkʊ́lʊ́	‘big scorpion’

In the examples above, the retracted H is underlyingly on the word-final vowel. The H may also be on a penult that is preceded by a long vowel, as in (15). In that case, the H is both subject to spreading to the final syllable by Tone Copy, and also is retracted.

(15)	ligaándamá	/ligaandáma/	‘spleen’
	nguúngutá	/nguungúta/	‘bean’
	lutʊʊ́tʊlʊ́	/lutʊʊtʊ́lʊ/	‘popcorn’
	kipɪɪ́kɪɪtɪ́	/kipɪɪkɪɪ́tɪ/	‘wood’
		ligandáma liikʊ́lʊ́	‘big spleen’
		ngungúta yaángu	‘my bean’
		lutʊtʊ́lu lwaángu	‘my popcorn’
		kipɪɪkɪ́ɪtɪ kikʊ́lʊ́	‘large wood’

Verb Tone

The overwhelming majority of Bantu languages have a contrast between H-toned and L-toned or toneless stems, expressed underlyingly by a two-way tonal contrast on the first root syllable. Kimatuumbi is one of a small number of tonal Bantu languages that have lost verbal lexical tone distinctions – Yao, Makonde, Makua, Kikuria, and Olusaamia are other examples – and instead assign surface tone based purely on the verb’s tense-aspect category. In Kimatuumbi verbs, a H is assigned to a particular position – stem-initial, stem-final, second-stem vowel, or third-stem vowel – depending on inflectional category.

The pattern of most basic verb forms is that H is assigned to the first-stem vowel. This pattern is used in the infinitive, perfective, future, and certain verb-focal forms.

(16)	*infinitive*	*3p perfective*	*1pl future*
	lʊ́ba	ba-lʊ́bite	twaa-lʊ́ba
	báamba	ba-báambite	twaa-báamba
	čáŋgaala	ba-čáŋgaalite	twaa-čáŋgaala
	pápaakiya	ba-pápaakiiye	twaa-pápaakiya
	pákatika	ba-pákatiike	twaa-pákatika
	láambata	ba-láambiite	twaa-láambata
	káčabanika	ba-káčabaniike	twaa-káčabanika
	kéeŋgeemba	ba-kéeŋgeembite	twaa-kéeŋgeemba
		3s strong verb-focus	*prog*
		eendánoo-lʊ́ba	‘ask’
		eendánoo-báamba	‘top’
		eendánoo-čáŋgaala	‘wonder’
		eendánoo-pápaakiya	‘grope’
		eendánoo-pákatika	‘shake down’
		eendánoo-láambata	‘lick’
		eendánoo-káčabanika	‘be confused’
		eendánoo-kéeŋgeemba	‘dig up’

Strong verb-focus forms such as [eendánoolʊ́ba] are best translated as ‘he is even *asking*.’ By comparison, the weak verb focus forms, which lack the prefix *-noo-*, assign H tone to the final vowel of the stem.

(17)	*3s pres. prog. verb-focus*	*3p past verb-focus*	
	eendaá-lʊbá	baatí-lʊbá	‘ask’
	eendaá-baambá	baatí-baambá	‘top’
	eendaá-čaŋgaalá	baatí-čaŋgaalá	‘wonder’
	eendaá-papaakiyá	baatí-papaakiyá	‘grope’
	eendaá-pakatiká	baatí-pakatiká	‘shake down’
	eendaá-laambatá	baatí-laambatá	‘lick’
	eendaá-kačabaniká	baatí-kačabaniká	‘be confused’
	eendaá-keeŋgeembá	baatí-keeŋgeembá	‘dig up’

In most dependent clause verb tenses (relative clauses, when-clauses, and ‘without V-ing’ clauses), a H tone is assigned to the second stem vowel.

(18)	*when we V*	*without V’ing*	
	patʊ́-lʊbá	wanga-lʊbá	‘ask’
	patʊ́-baámba	wanga-baámba	‘top’
	patʊ́-čaŋgáala	wanga-čaŋgáala	‘wonder’

patʊ́-papáakiya	wanga-papáakiya	'grope'
patʊ́-pakátika	wanga-pákatika	'shake down'
patʊ́-laámbata	wanga-laámbata	'lick'
patʊ́-kačábanika	wanga-kačábanika	'be confused'
patʊ́-keéŋgeemba	wanga-keéŋgeemba	'dig up'

Past tense subordinate verbs as well as deverbal stative adjectives have an additional H tone on the stem-final vowel.

(19)	'when you V'd'	'in a V'd state (cl. 7)'	
	paʊ́-lʊbíté	ki-lʊbá	'ask'
	paʊ́-baámbité	ki-baámbá	'top'
	paʊ́-čaŋgáalité	ki-čaŋgaálá	'wonder'
	paʊ́-papáakiiyé	ki-papáakiyá	'grope'
	paʊ́-pakátiiké	ki-pakátiká	'shake down'
	paʊ́-laámbiité	ki-laámbatá	'lick'
	paʊ́-kačábaniiké	ki-kačábaniká	'be confused'
	paʊ́-keéŋgeembite	ki-keéŋgeembá	'dig up'

H tone is assigned to the first-stem vowel in the subjunctive and participial tenses.

(20)	'you should V'	'while I was V-ing'	
	u-lʊbé	kani-lʊbá	'ask'
	u-baámbe	kani-baámba	'top'
	u-čaŋgaále	kani-čaŋgaála	'wonder'
	u-papaakíye	kani-papaakíya	'grope'
	u-pakatíke	kani-pakatíka	'shake down'
	u-laambáte	kani-laambáta	'lick'
	u-kačabánike	kani-kačabánika	'be confused'
	u-keeŋgéembe	kani-keeŋgéemba	'dig up'

Forms such as [u-baámbe] and [kani-baámba] derive from intermediate *ubaambé* and *kanibaambá*, H tone is assigned to the third *stem* vowel, but the H shifts left by Heavy Retraction. One difference between nouns and verbs in the application of heavy Retraction is that the rule will shift a H to a prepenult long syllable in a noun ([kipɪ́kɪɪtí] ← /kipɪɪkɪ́ɪtɪ/ 'wood') but not in a verb (u-papaakíye 'you should grope').

The final tone pattern used in the verb system assigns H tone to the first and third vowels of the stem, in deverbal nominalizations selecting the suffix *-i*.

(21)	n-nʊ́bí	'asker'	m-máambí	'one whotops'
	ŋ-kógotí	'scraper'	n-čáŋgaáli	'wonderer'
	n-nóŋgeláaŋgi	'converser'	m-pápaákiyi	'groper'
	m-pákatíki	'shaker'	n-náambáti	'licker'
	ŋ-káčabániki	'confused person'	ŋ-kéeŋgéembi	'digger'

Phrasal Phonology

Kimatuumbi has a rich set of phonological alternations applying at the phrasal level. Some of these are utterance level rules which only care whether a word is at the end of an utterance or not, while others are sensitive to the specific syntactic relations between the involved words.

Shortening

One sandhi rule is Shortening, which shortens long vowels within a stem when one word is followed by another word, provides that they are in a head-modifier relationship. Examples of this involving nouns and adjectives are seen in (22), and verbs followed by objects or adverbs are seen in (23).

(22)	ki-kóloombe	'cleaning shell'
	ki-kólombe čaáŋgu	'my cleaning shell'
	ki-kólombe kikʊ́lʊ́	'big cleaning shell'
	li-peésa	'money'
	li-pesá lyé	'the money'
	li-pesá lyanáalyoobíté	'money that I lost'
(23)	naa-kálaaŋgite	'I fried'
	naa-kálaŋgite mapíiŋgá	'I fried eggs'
	naa-kálangite líiso	'I fried yesterday'
	u-paánde	'you should plant'
	u-pandé maloómbe	'you should plant corn'
	u-pandé paapasá	'you should plant the day after tomorrow'
	u-pandé lí	'you should not plant'

Shortening interacts with verb focus, so that a focused verb does not undergo shortening.

(24)	neendá-twɪɪká misígó	'I'm *lifting* the loads'
	aatí-pwaatá Mambóondo	'he *followed* Mamboondo'
	tweendeé-kuŋuundá lí	'we aren't *filtering*'
	toola lusólokó	'just *take* the bean!'

If the following word is not a modifier of the previous word, there is no shortening. For example, inside the VP, one noun does not undergo shortening when followed by another word outside of the noun's phrase; nor does an adjective undergo shortening before another adjective.

(25)	naa-m-péi	Mamb**oo**ndo	eéla	'I gave M. money'
	I-him-gave	*Mamboondo*	*money*	
	naa-ki-bwéni	kikól**oo**mbe	líilí	'I didn't see a shell'
	I-it-saw	*shell*	NEG	
	mbopó	nd**aá**so	ngulʊ́	'big long machete'
	machete	*long*	*big*	

Verbs do not undergo shortening when followed by a sentential adverb, which is outside of the verb's phrase; nor is there shortening in the verb of a subordinate clause that is followed by a word of the matrix clause.

(26)	aa-kálaaŋga	sáána		'he will really fry'
	he.fut-fry	*really*		
	naa-m-péi	ywaá-kaátite	eéla	'I will give money to the one who cut'
	I-him-gave	*who.he-cut*	*money*	

Phrasal Tone Insertion

Another syntactically conditioned phonological rule of Kimatuumbi is Phrasal Tone Insertion, which adds a H tone between maximal projections that are dominated by a maximal projection:

(27) $[_{Xmax} \ldots [_{Ymax} __] [_{Zmax}] \ldots]$

This configuration rule is found in a number of contexts, for example between a subject NP and a VP.

(28) Mambóondo (/Mamboomdo/) P.N.
Mamboond**ó** aawíile 'Mamboondo died'
kiyógoyo 'bird (sp.)'
kiyógoy**ó** čaatí tʊʊmbʊká 'the bird fell'

H tone is inserted at the end of each phrase coming before the verb, which may include objects and adverbs owing to the free word order of the language.

(29) iíjuma 'Friday'
iíjum**á** kiyógoy**ó** Mamboond**ó** naampéi lí
'I didn't give Mamboondo a kiyogoyo on Friday'

Tone insertion only applies to the end of the phrase that is a sister to the VP; thus an adjective inside the subject NP does not receive any H.

(30a) mund**uu** ntokómaʊ́ a-wíile 'a sluggish person is dead'
person sluggish he-be dead
*mund**úu** ntokóma**ú** awíile

NP and sentential conjunctions are also subject to this rule.

(30b) patúkatítee ñam**á** Ukumʊ́ akuŋundite wɪ́ímbɪ
when-we-cut mean ʊ. he-filtered beer
'when we cut the meat, ʊkumu filtered the beer'
mpuuŋg**á** na kindoólo 'rice and sweet potato'
rice and sweet potato
kikálaaŋgó aʊ́ kibIgá 'frying pan or a pot'
frying pan or pot

The juncture between a VP and a sentential adverb provides another context for this rule.

(31) niimpéendiile 'I like him'
niimpéendiil**é** píta 'I really like him'
aakálaanga 'he will fry'
aakálaang**á** kwaáli 'perhaps he will fry'

Initial Tone Insertion

Two of the syntactically conditioned rules are sensitive to crossing sentence boundaries. One of these rules, Initial Tone Insertion, places a H at the beginning of certain words – a relatively arbitrary collection of adverbs, function words, and agreement prefixes, plus nouns beginning with a long vowel – when the preceding stem has no medial H.

(32) kindoló **ča**-Mambóondo 'sweet potato of Mamboondo'
kiwɪkɪlyo **čá**-Mambóondo 'cover of Mamblondo'
tu-tyatyakíkiye **ma**laáʊ 'we should make plaster tomorrow'
twaa-tyátyakikiya **má**laáʊ 'we will make plaster tomorrow'
paní-teléka **lii**yawá 'when I cook pumpkin'
ni-teleka **líi**yawá 'I cook pumpkin'

Unlike Shortening, the interacting words do not need to be in the same phrase, thus H can be assigned to the instrumental prefix *na-* when preceded by a toneless direct object. H tone can also be assigned to a word in a subordinate clause, conditioned by the preceding word in the matrix clause.

(33) naammʊ́lige Kiwiiyo **ná**-mboópo 'I killed Kiwiyo with a machete'
I-him-killed Kiwiiyo with-machete
naammʊ́lige **ká**apangá kaási 'I killed him when he was working'
I-him-killed when-he-do work

But no H is inserted when the trigger word is in a subordinate clause and the target is in the higher clause.

(34) aambákiye pánga twaabʊ́ʊka kindaái
he-me-told that we-will-return tomorrow
'He told me that we will return tomorrow'
*aambákiye pánga twaabʊ́ʊka kíndaái

As noted in Odden (1996: Sect. 6.1.4), this motivates the condition that the trigger command the target, in the traditional sense of command.

Lengthening

A second sentence-level rule with a clause-mate condition is Lengthening, which lengthens a vowel before a CV(C)V noun stem. Examples of this are seen in (35).

(35) aatweti ñoóme 'he took a cat'
aatwéti ndó 'he took a bucket'
aatwétii ñáma 'he took a bottle'
aatwétii píli 'he took a puff adder'

This rule also applies to the class 5 noun prefix /li-/, but not any other noun class prefixes.

(36) lii-yawá 'pumpkin' ma-yawá 'pumpkins'
lii-kʊ́tI 'coconut leaf' ka-kʊ́tí 'little coconut leaf'

Failure of Lengthening to cross a sentence boundary is seen below:

(37) ni-yuwine $[_s$ mbaká awíile 'I heard that the cat died'
I-heard cat it-died

The relevance of internal sentence boundaries is not a widely discussed aspect of the syntax–phonology interface problem, and it is not clear how prosodic theories of the interface would handle the relevance of the node S in phonology. See Odden (1996: Sect. 6.2) for discussion involving the notion 'pause.'

Syntactically Unconditioned Rules

There are, in addition, a number of other external sandhi rules that apply without consideration of syntactic factors, either applying between any two words or applying just at the end of the utterance. One example of that is the rule H Tone Assignment, which assigns a H tone to the second vowel of any toneless stem, when it stands at the end of the utterance; this rule was discussed in 'Nouns' above. Similarly, Tone Copy, which spreads a penult H tone to the final vowel of the word in nouns, only applies to prepausal nouns. A third rule is Perfective Truncation, a rule that optionally deletes the final syllable *le* in a perfective verb which is not prepausal.

(38) aantélekile Mambóondo 'he cooked for Mamboondo'
aantéleki Mambóondo 'he cooked for Mamboondo'
baakʊ́ñwile Libulʊ́le 'they touched Libulule'
baakʊ́ñwi Libulʊ́le 'they touched Libulule'

Other such rules are discussed in Odden (1996: Sect. 6.2).

Organization of Rules

Interaction between phonological rules in Kimatuumbi can be rather complex and challenges certain theoretical assumptions regarding lexical vs. postlexical rules made in the theory of Lexical Phonology. The interaction between Glide Formation, morphosyntactically governed rules of tone-assignment in verbs, and the sandhi rule Shortening especially result in a considerable degree of opacity.

The rule Glide Formation applies cyclically, where a cyclic domain break is defined at the junction between proclitics vs. the basic word. This can be demonstrated by comparing analogous vowel sequences, differentiated as to whether the first is in a proclitic or not. One class of examples involves /CV-CV-V/ sequences morphologically distinguished as locative prefix + noun class prefix + vowel initial root, versus subject prefix + object prefix + vowel initial root. One condition on Glide Formation is that it applies obligatorily to a prevocalic high vowel that is initial – in the domain visible at that stage in the cycle – but is optional when applied to a domain-medial prevocalic high vowel.

(39) /a-lu-áandiike/ → [aluáandiike] ~ [alwáandiike] 'he wrote it'
he-it-wrote
/pa- [lu -áanjʊ́]/ → [palwáanjʊ́] 'in the firewood'
at -n. class -firewood

In the case of /a-lu-áandiike/, both the subject prefix *a-* and the object prefix *-lu-* are underlyingly present at the stage where Glide Formation applies, and since *lu* is not initial in that domain, Glide Formation is optional. In contrast, in the case of /pa-[lu-áanjʊ́], first the word [lwáanjʊ́] is derived from /lu-áanjʊ́/, and at that stage *lu* is initial in the cyclic domain, this Glide Formation is obligatory. Subsequently, the proclitic /pa/ is added, but this has no effect on the optionality of Glide Formation on the earlier cycle.

The sandhi rule Shortening applies both before Glide Formation (applied at the stem level) and after Glide Formation (at the word level). The consequence of this interleaving of Shortening between applications of Glide Formation is that long vowels that are created via the compensatory lengthening side effect of Glide Formation at the stem level (*akyaana*) are subject to Shortening when a modifier follows, but long vowels created via Glide Formation on the poststem cycle (*twaakyaana*) are not subject to shortening. Phrasal Shortening of long vowels created at the stem level is seen in (40).

(40) /ak-i-ana/ → [ákyaana] 'to net-hunt for each other'
hunt-for-e.o
/ak-i-ana itʊ́ʊmbIlI/ → [akyana itʊ́ʊmbIlI] 'to net-hunt monkeys for each other'
hunt-for-e.o monkeys

In (41), nonshortening of long vowels created at the word level is evident.

(41) /tu-ak-i-ana itʊ́ʊmbIlI/ → [twaakyana itʊ́ʊmbIlI]
we-hunt-for-e.o monkeys
'we net-hunt monkeys for each other'

This poses a problem for Lexical Phonology, in that the presumably postlexical rule Shortening is sandwiched between applications of the cyclic rule Glide Formations.

The rule Heavy Retraction shifts a H tone from a final syllable to a long penult, so that predicted/ u-toolé/ 'you should take' – cf. [u-teleké] – becomes [u-toóle]. But a long vowel derived via Glide Formation does not trigger tone retraction.

(42) áka 'to hunt' w-aaké 'you should hunt'
éka 'to laugh' w-eeké 'you should laugh'

Thus Glide Formation counterfeeds Heavy Retraction.

Since root-initial vowels can be underlyingly long, this results in particularly opaque alternations in (43), where Glide Formation is not necessary to bring about the long vowel triggering Retraction. In these examples, Retraction applies to the H that is expected to be on the final syllable.

(43)	áama	'to emigrate'	w-aáme	'you should emigrate'
	íɪmba	'to dig'	w-íɪmbe	'you should dig'

Thus, underlying /u-aamé/ undergoes Retraction to give *uaáme*, then Glide Formation resulting in surface *waáme*. The decision whether H tone retracts thus is based on the distinction between long vowels derived as a side effect of Glide Formation, vs. those that are underlyingly long vowels.

Opaque application of Shortening is seen in (44) where the verb is followed by an object.

(44)	/u-aamé lí/	→ [waamé lí]	'you shouldn't emigrate'
	/u-Πmbé makéne/	→ [wΠmbé makéne]	'you should dig holes'

The evidence that Shortening has actually applied in [waamé lí] is indirect, since there is no surface length alternation. The variation between [waáme] and [waamé ...] is parallel in terms of the underlyingly similar forms [ukaáte] 'you should cut' and [ukaté ...]. Thus, to explain the alternating location of H, we presume that /u-aame lí/ first undergoes Shortening and tone assignment, giving *u-amé lí* (analogous to *ukaté lí* 'you should not cut') and since in this form there is no long vowel, Heavy Retraction does not apply. Afterwards, Glide Formation applies to give [waamé lí], effectively restoring the original vowel length, this such an A → B → C derivation is a classic example of the 'Duke of York Gambit' (Pullum, 1976).

Kindaichi, Kyosuke (1882–1971)

A Pérez Pereiro, Georgetown University, Washington, DC, USA

Kyosuke Kindaichi was born on May 5, 1882, in the city of Morioka, Japan. He achieved recognition in Japan and abroad through the study of the Ainu language and, in particular, the yukar, the oral epics of the Ainu, of which he collected many from informants at a time when the Ainu language was already moribund. He is widely considered the founder of modern Ainu studies in Japan.

Kindaichi entered the linguistics department of Tokyo Imperial University in 1904, graduating in 1907 with the dissertation *Particles in the languages of the world*. During this time, he conducted research on the Sakhalin (Karafuto) Ainu and their dialects. In 1913, Kindaichi began teaching Ainu at Tokyo Imperial University, becoming a full professor in 1941. He also accepted a post at Kokugakuin University as professor of linguistics and Japanese in 1922, becoming a professor emeritus in 1968. He continued to conduct fieldwork in Hokkaido through a network of informants. Kindaichi was intrigued by the possibility that the Ainu language might be related to the

Kindaichi, Kyosuke (1882–1971)

A Pérez Pereiro, Georgetown University, Washington, DC, USA

Kyosuke Kindaichi was born on May 5, 1882, in the city of Morioka, Japan. He achieved recognition in Japan and abroad through the study of the Ainu language and, in particular, the yukar, the oral epics of the Ainu, of which he collected many from informants at a time when the Ainu language was already moribund. He is widely considered the founder of modern Ainu studies in Japan.

Kindaichi entered the linguistics department of Tokyo Imperial University in 1904, graduating in 1907 with the dissertation *Particles in the languages of the world*. During this time, he conducted research on the Sakhalin (Karafuto) Ainu and their dialects. In 1913, Kindaichi began teaching Ainu at Tokyo Imperial University, becoming a full professor in 1941. He also accepted a post at Kokugakuin University as professor of linguistics and Japanese in 1922, becoming a professor emeritus in 1968. He continued to conduct fieldwork in Hokkaido through a network of informants. Kindaichi was intrigued by the possibility that the Ainu language might be related to the

Native American languages, noting the polysynthetic, incorporating character of the Ainu verb, which is also found in Amerindian languages.

Several of Kindaichi's students went on to become prominent scholars of the Ainu language themselves. These included Shiro Hattori, a recognized dialectologist of both Hokkaido and Sakhalin Ainu, and Itsuhiko Kubodera, a compiler of Ainu oral literature. Kindaichi was also remarkable for encouraging Ainu people themselves to participate in and conduct research into their own language and oral histories. Among the most important of these scholars were Mashiho Chiri, the first Ainu to attend Tokyo Imperial University, with whom Kindaichi co-authored *Ainu goho gaisetsu* [Outline of Ainu grammar], and Shigeru Kayano, an Ainu anthropologist and politician.

Along with several native speakers of the Ainu language, notably Yukie Chiri and Matsu Kannari, Kindaichi compiled and published various yukar and other stories that might have been lost otherwise. He also helped John Batchelor's adopted daughter, Yaeko Batchelor, publish as part of her crusade against the alcoholism that was ravaging the Ainu community. Although Kindaichi believed the traditional Ainu would disappear, he resisted attempts to characterize the Ainu as a dying race, as was common at the time, and he offered instead the possibility of constructive assimilation – using his star pupil, Mashiho Chiri, as an example of Ainu genius. His work had the double effect of helping to empower a generation of Ainu scholars to become active researchers and interpreters of their culture and of providing a source of pride, in the form of the rich intellectual tradition of the yukar, for a people who for generations had been told that they had no culture or civilization to speak of.

Besides his Ainu studies, Kindaichi was active in the Linguistic Society of Japan, first as vice president from 1938 and then as president from 1967. He held this post until his death on November 14, 1971, at the age of 89. He was also known as the father of Haruhiko Kindaichi, a respected linguist in his own right.

Kinesics

M Danesi, University of Toronto, Toronto, Canada

Introduction

The study of bodily movements, such as gestures and facial expressions, is called *kinesics* (from the Greek word *kinêsis* 'movement'). Kinesic communication is a complementary, supplementary, and at times, substitutive mode of communication to verbal (and especially vocal) language. Kinesics is a part of anthropology, psychology, and semiotics, where it is included as a topic within the general domain of nonverbal communication.

The founder of kinesics as a field of inquiry and research was the American anthropologist Ray L. Birdwhistell (1918–1994). Influenced by the views of his teacher, the great anthropologist Margaret Mead (1901–1978), and the work of David Efron (1941) in the early 1940s, Birdwhistell became interested in analyzing the way people interacted by watching films. He noticed that people seemed to transmit information unconsciously through their eye movements, facial expressions, and postures. For this reason, he came to view body language as a critical component of human interaction. His first book on the topic, *Introduction to kinesics*, was published in 1952. In it, he discussed the role of body motion and gesture in human communication.

In a series of papers and encyclopedia entries (1955, 1960, 1961, 1963, 1974, 1979), Birdwhistell defined kinesics as the study of all aspects of nonverbal communication, including gesture and touch. Today, however, some of these are studied under separate branches of semiotics (*see* **Nonverbal Communication**). Kinesic phenomena are also called 'paralanguage' within linguistics proper, indirectly

Kinesics

M Danesi, University of Toronto, Toronto, Canada

Introduction

The study of bodily movements, such as gestures and facial expressions, is called *kinesics* (from the Greek word *kinêsis* 'movement'). Kinesic communication is a complementary, supplementary, and at times, substitutive mode of communication to verbal (and especially vocal) language. Kinesics is a part of anthropology, psychology, and semiotics, where it is included as a topic within the general domain of nonverbal communication.

The founder of kinesics as a field of inquiry and research was the American anthropologist Ray L. Birdwhistell (1918–1994). Influenced by the views of his teacher, the great anthropologist Margaret Mead (1901–1978), and the work of David Efron (1941) in the early 1940s, Birdwhistell became interested in analyzing the way people interacted by watching films. He noticed that people seemed to transmit information unconsciously through their eye movements, facial expressions, and postures. For this reason, he came to view body language as a critical component of human interaction. His first book on the topic, *Introduction to kinesics*, was published in 1952. In it, he discussed the role of body motion and gesture in human communication.

In a series of papers and encyclopedia entries (1955, 1960, 1961, 1963, 1974, 1979), Birdwhistell defined kinesics as the study of all aspects of nonverbal communication, including gesture and touch. Today, however, some of these are studied under separate branches of semiotics (*see* **Nonverbal Communication**). Kinesic phenomena are also called 'paralanguage' within linguistics proper, indirectly

acknowledging the crucial role that they are perceived to play in speech communication.

Birdwhistell fashioned kinesic practice on the general methods and concepts of American descriptive linguistics. By collecting and analyzing relevant data on body movements, facial expressions, gestures, and the like during social interaction Birdwhistell claimed that it is possible to write a 'kinesic grammar' in the same way that linguistics write a verbal grammar by analyzing words and sentences. As he (1970: 157) put it: "The first premise in developing a notational system for body language is to assume that all movements of the body have meaning. None are accidental." He called such movements 'kinemes' (in analogy with 'phonemes'). The kineme is the prototype for a group of movements that are not identical, "but which may be used interchangeably without affecting social meaning" (Knapp, 1978: 94–95), and thus "can be construed as having a definite organization or structure, just as language is understood in terms of its grammar" (Duncan and Fiske, 1977: xi).

Because of its foundations in linguistic structuralism, kinesics was included early on within semiotics (Sebeok *et al.*, 1964; Eco, 1968). Some see it as a term encompassing the general study of nonverbal communication (Duncan, 1969: 118; Key, 1975; Harper *et al.*, 1978: 119; Knapp, 1978: 12; Raffler-Engel, 1980: 30). Others see it as neither an autonomous field of study nor a branch of semiotics; to them, it is an approach to the study of verbal behavior (Argyle, 1975; Scherer *et al.*, 1979; Scherer and Ekman, 1982).

Birdwhistell divides the study of kinesic communication into four procedures:

1. **Prekinesics**. This involves a description of the physiology of body movements (similar in nature to phonetics, which describes the physical nature of verbal sounds). These are called 'kines' (in analogy with 'phones'), constituting the minimal elements of corporeal behavior that have a differential function in a given context.
2. **Microkinesics**. This is the level of identification of 'kinemes,' the basic differential corporeal units and their variants, called 'allokines' (in analogy with 'allophones'). To make the study of kinemes systematic and standardized, Birdwhistell developed symbols for eight body sections – head, face, trunk, shoulder, hands, legs, feet, neck – called 'kinegraphs.'
3. **Social kinesics**. This is the analysis of the meaning of kinemes within social contexts.
4. **Parakinesics**. This involves identifying the modifiers of kinemes, including motion qualifiers (intensity, range, velocity of movement) and activity modifiers (mode of an entire body in motion).

Areas of Kinesic Research

Humans convey over two-thirds of their messages through the body, producing up to 700 000 physical signs, of which 1000 are different bodily postures, 5000 are hand gestures, and 250 000 are facial expressions (Morris *et al.*, 1979). The body is, in a phrase, a primary source of communication. Studying the kinesic signs that are produced with, through, or on the body has become a central objective of semiotics. Kinesic signs can be inborn (unwitting), learned (witting), or a mixture of the two. Blinking the eyes, clearing the throat, and facial flushing are innate (inborn) kinesic signals. These are often involuntary, as are, for example, facial expressions of happiness, surprise, anger, disgust, and other basic emotions. Laughing, crying, and shrugging the shoulders are examples of mixed kinesic signals. They may originate as innate actions, but cultural rules shape their timing and use. Gestures such as a wink of the eye, a thumbs up, or a military salute, are learned kinemes. The meanings of such signs vary among different cultures. Kinesic messages can give a look and feel to a conversation remembered long after spoken words fade away. They can also be structured to lie or conceal something. For example, pressing the lips together may indicate disagreement or doubt, even if the person's verbal statements convey agreement. When verbal and kinesic statements conflict, listeners will likely believe the latter more.

The main areas of research within kinesics are eye contact, posture, touch, gesture, and facial expression. Clothing is often included within the kinesic purview of research. However, as part of 'material culture,' rather than of kinesics *per se*, the meanings of clothes are usually treated under a separate branch of semiotics (*see* **Clothing: Semiotics**).

Eye Contact

Research on eye contact in various fields, from psychology to semiotics, has found that across cultures, kines such as the length of time involved in eye contact along with the pattern of contact (looking into the eyes, looking down or up, etc.) convey what kinds of social relationship people have to each other. Some patterns appear to be universal: staring is typically interpreted as a challenge; 'making eyes' at someone is normally interpreted as flirtation; narrow eyelids communicate pensiveness, and making the eyebrows come nearer together communicates thoughtfulness; raising the eyebrows conveys surprise. However, even in these there is culture-specific variation. It has been found that Southern Europeans will tend to look more into each other's eyes during conversation than

will North Americans; in some cultures males do not look into female eyes unless they are married or members of the same family. Some patterns convey specific meanings in specific cultural contexts. For example, gazing is interpreted as indicative of sexual wonder, fascination, awe, or admiration depending on the culture; staring is perceived as sexual curiosity, boldness, insolence, or stupidity – again depending on social context and culture.

A large amount of eye communication among humans unfolds in the form of unwitting signals. It has been shown, for example, that men are sexually attracted to women with large pupils, which signal unconsciously a strong and sexually tinged interest, as well as making females look younger (Sebeok, 1994). This would explain the cosmetic vogue in central Europe during the 1920s and 1930s of women using a crystalline alkaloid eye-drop liquid derived from *belladonna* ('beautiful woman' in Italian). The women of the day bought the liquid because they believed – and correctly so, it would appear – that it would enhance facial appearance and sexual attractiveness by dilating the pupils. As the linguist Karl Bühler (1934: 28) aptly observed, such signals act like regulators, eliciting or inhibiting some action or reaction.

Posture

Posture communicates a large amount of information about people's identity, gender, class, moods, motivation, and attitudes, playing a critical role in interpersonal relationships. It can be defined as a pose or movement that can be broken down into a series of specific kinetic movements conveying certain personal and/or social meanings. As in the case of eye contact, there appear to be both universals and culture-based differences in posture kinemes, as kinesic research has found. Some 'universal' posture kinemes are:

1. Slumped posture = low spirits
2. Erect posture = high spirits, energy, and confidence
3. Leaning forward posture = open and interested behavior
4. Leaning away posture = defensive or disinterested behavior
5. Crossed arms = defensive behavior
6. Uncrossed arms = willingness to listen.

Posture is prominent as a tactic in courtship displays, which may look comical or absurd to outsiders, but which constitute crucial modes of communication at key stages in the enactment of reproductive urges to the members of a society or group. 'Sexual posing' makes sense only if the appropriate physical and social contexts are present during courtship or flirtation. While such posing may be residues of ancient animal mechanisms, as some suggest, the great diversity that is evident in courtship posing across cultures suggests that it is not a mere contemporary version of instinctual mating behavior. Rather, sexual postures are shaped in large part by human notions of gender and romance and are, therefore, constantly inclined to change (Synnot, 1993). In the human species, courtship is not only a reflex of biology, but also a product of history and tradition. It is the outcome of Nature and Culture cooperating in a type of partnership that is found nowhere else in the animal realm.

Sexual posing is part of a culture's gender code that mediates peoples' perception of which bodily parts or zones are erogenous. The semiotician Michel Foucault (1926–1984) argued persuasively that 'sins of the flesh' are hardly universal (Foucault, 1976). They must be defined culturally. The Puritans of England, for instance, saw any form of sexual contact or gazing in a marriage situation as a kind of 'necessary sin.' 'Sexual temptation' is still felt by some people to be 'sinful.' On the other hand, the many 'hedonistic' rites and practices of our own and other cultures exalt and glorify the eroticism of the human body. Obviously, what is 'obscene' behavior to some is 'natural' behavior to others. While sexual urges are based in biology, perceptions of what is or is not erotic, sinful, or obscene are ensconced in cultural traditions and habits.

Touch

Another main area of kinesic research studies the social functions and manifestations of touch. The study of touch actually constitutes its own subfield, generally called 'haptics,' although it is still considered a general category of inquiry within kinesics.

A haptic pattern that reveals how research in this area is conducted is 'hand touching,' commonly called 'handshaking.' The zoologist Desmond Morris (1969) claimed that the Western form of handshaking may have started as a way to show that neither person was holding a weapon. It thus became a 'tie sign,' because of the bond it was designed to create. Throughout the centuries, the tie sign became a symbol of equality and fairness among individuals and was used to seal agreements of all kinds. Indeed, refusing to shake someone's outstretched hand was perceived, and continues to be interpreted to this day, as a 'counter-sign' of aggressiveness or as a challenge. Predictably, this form of tactile greeting reveals a high degree of cross-cultural variation. People can squeeze the hand (as Europeans and North Americans do), shake the other's hand with both hands, shake the

hand and then pat the other's back or hug him or her, lean forward or stand straight while shaking, and so on. Haptic greeting and social contact codes are not limited, of course, to manual touch patterns. Other patterns include patting someone on the arm, shoulder, or back to indicate agreement or to compliment; linking arms to indicate companionship; putting one's arm around the shoulder to indicate friendship or intimacy; holding hands with family members or a lover to express intimacy; hugging to convey happiness at seeing a friend or a family member; and so on.

Anthropologists are unclear as to why haptic codes vary so much across cultures. The reason may have a basis in culture perceptions of the body. Some people perceive the skin to be a surface 'sheath.' Others perceive the body as a 'container' or think of themselves as 'contained' in their skin. The zones of privacy that define Self-space in these cultures, therefore, include the clothes that cover the skin. Others feel instead that the Self is located down within the body shell, resulting in a totally different perception of haptic behaviors. People in such cultures are in general more tolerant of crowds, of noise levels, of the touching of hands, of eye contact, and of body odors than most North Americans are. These perceptions are bound to affect haptic behavior that underlies the formation of cultural body codes.

One aspect of haptic behavior that is shrouded in evolutionary mystery is 'lip touching' or osculation in the human species, known, of course, more commonly as 'kissing.' When the lips of adult people touch, the kissing act is perceived normally as an erotic one. But not all kissing is erotic. Kissing other parts of the face, such as the forehead, the head, and the cheeks can be a way of showing affection to children, friends, pets, etc. Erotic kissing, however, is particularly interesting as an evolutionary and cultural phenomenon, because it seems to be a kind of mock-suckling or mock-feeding action, implying vulnerability, closeness, and sensuality. However, it is not universal. It is not common in China or Japan, for instance; and it is completely unknown in many African societies. Traditional Inuit and Laplander societies are more inclined to rub noses than to kiss to engage in sexual foreplay.

Gesture

Gesture is another main area of kinesic research, although it too, like haptic communication, tends to constitute its own autonomous subfield of investigation. Gesture can be defined simply as the use of the hands, the arms, and to a lesser extent, the head to make kinesic signs. Although there are cross-cultural similarities in gesture, substantial differences also exist both in the extent to which gesture is used and in the interpretations given to its particular uses. For example, the head gestures for 'yes' and 'no' used in the Balkans seem inverted to other Europeans. In 1979, Desmond Morris, together with several of his associates at Oxford University, examined 20 gesture forms in 40 different areas of Europe. The research team found some rather fascinating things. For instance, they discovered that many of the forms had several meanings, depending on culture – a tap on the side of the head can indicate completely opposite things, 'stupidity' or 'intelligence,' according to cultural context. They also found that most of the forms were used in many countries.

Gesture is also found in primates. Chimpanzees raise their arms in the air as a signal that they want to be groomed, they stretch out their arms to beg or invite, and they have the ability to point to things (Beaken, 1996: 51). These gestures are, evidently, purposeful and regulatory of the actions of other chimps. But the number of gestural forms of which chimpanzees are capable is limited. Human gesturing, on the other hand, is productive and varied. And it can be used as a substitute for vocal language, as is the case with the many sign languages used in communities of the hearing-impaired. It can also be employed as an alternate mode of communication, as is the case with the sign languages used by religious groups during periods of imposed silence, with the hand language used by traffic personnel, and with the hand and arm language used by conductors of orchestras.

Many semioticians and linguists consider gesture to be a more fundamental form of communication than vocal language. A pragmatic confirmation of this is obtained when one doesn't speak the language of the people of a country one is visiting. In order to communicate with the people on the street, in a hotel, or in a store, one instinctively resorts to gesture in order to get a message across or to negotiate meaning. For example, if one were to describe an automobile to someone, one would instinctively use the hands to iconically portray a steering wheel and the motion used to steer a car, accompanying this gesture, perhaps, with an imitative sound of a motor. This anecdotal scenario not only suggests that gesture is a fundamental mode of communication, but also that its essentially iconic modality makes it a much more universal, and less culture-dependent, mode of message-making than vocal language.

Gesture spans the entire range of signification of vocal language (Bremer and Roodenberg, 1991; Armstrong *et al.*, 1995). Using the index finger is the most common manifestation of deixis (indicating where things are in space and time), although any

body part that can be moved directionally (lips, nose, tongue, etc.) can also be used to point out referents in the immediate environment, to indicate directions, etc. Iconic (simulative) gestures are employed commonly to represent the shape of objects: for example, to refer to a round object people the world over tend to use both hands together moving in opposite – clockwise (the right hand) and counter-clockwise (the left hand) – directions. Such a gesture is characterizable as a kind of 'spatial drawing movement.' And indeed, if the movements of the hands during gesture are transferred by some drawing instrument onto some surface such as paper, the referent of the gesture will be transferred to the paper as a visual figure. Fingers can also be used to represent symbols (by portraying the outline of the symbol). The most common use of this kind of gesturing is in the sign languages for the hearing-impaired. Lastly, symbolic gestures are often used to stand conventionally for social functions or for carrying out interactional protocols such as greeting, affirmation, negation, etc.

Some truly fascinating research by the linguist David McNeill (1992) has shown, moreover, that gesture is a complementary communicative modality of vocal language. McNeill videotaped a large number of people as they spoke, gathering a substantial amount of data on gestural behavior during vocal communication. The gestures that accompany speech are known as 'gesticulants.' McNeill's findings suggest that gesticulants are unconscious forms that convey images that cannot be shown overtly in speech, as well as images of what the speaker is thinking about. Vocal speech and gesticulation constitute a single integrated communication system in which both cooperate to express the person's intentions and thoughts.

On the basis of his findings, McNeill was able to classify gesticulants into five main categories. First, there are 'iconic' gesticulants which, as their name suggests, bear a close resemblance to the referent or referential domain of an utterance, e.g., when describing a scene from a story in which a character bends a tree back to the ground, a speaker observed by McNeill appeared to grip something and pull it back. His gesture was, in effect, a visual icon of the action talked about, revealing both his memory image and his point of view (he could have taken the part of the character or the tree, instead).

Second, there are 'metaphoric' gesticulants. These are also pictorial, but their content is abstract, rather than strictly iconic. For example, McNeill observed a male speaker announcing that he had just seen a cartoon, simultaneously raising up his hands as if offering his listener a kind of object. He was obviously not referring to the cartoon itself, but to the 'genre' of the cartoon. His gesture created and displayed this genre as if it were an object, placing it into an act of offering to the listener. This type of gesticulant typically accompanies utterances that contain expressions such as 'presenting an idea,' 'putting forth an idea,' 'offering advice,' and so on.

Third, there are 'beat' gesticulants. These resemble the beating of musical tempo. The speaker's hand moves along with the rhythmic pulsation of speech, in the form of a simple flick of the hand or fingers up and down, or back and forth. Beats are indexes, marking the introduction of new characters, summarizing the action, introducing new themes, etc. during the utterance.

Fourth, there are 'cohesive' gesticulants. These serve to show how separate parts of an utterance are supposed to hold together. Beats emphasize sequentiality, cohesives globality. Cohesives can take iconic, metaphoric, or beat form. They unfold through a repetition of the same gesticulant form, movement, or location in the gesture space. It is the repetition that is meant to convey cohesiveness.

Fifth, there are 'deictic' gesticulants – 'deixis' is the term used to designate all kinds of pointing or indicating signs. Deictic gesticulants are aimed not at an existing physical place, but at an abstract concept that had occurred earlier in the conversation. These reveal that we perceive concepts as having a physical location in space.

McNeill's work gives us a good idea as to how gesture and language complement each other in normal discourse. As Frutiger (1989: 112) has also observed, accompanying gesture forms reveal an inner need to support what one is saying orally: "If on a beach, for example, we can hardly resist drawing with the finger on the smooth surface of the sand as a means of clarifying what we are talking about." McNeill's gesticulant categories are actually subtypes of the more generic category of gesture called an 'illustrator' by kinesics researchers. Other categories are emblems, affect displays, regulators, and adaptors:

1. **Illustrators**: As just discussed, these literally illustrate vocal utterances. Examples are the circular hand movements when talking of a circle, moving the hands far apart when talking of something large, moving both the head and hands in an upward direction when saying *Let's go up*.
2. **Emblems**: These directly translate words or phrases. Examples are the *Okay* sign, the *Come here* sign, the hitchhiking sign, waving, and obscene gestures.
3. **Affect Displays**: These communicate emotional meaning. Examples are the typical hand movements that accompany states and expressions of

happiness, surprise, fear, anger, sadness, contempt, disgust, etc.

4. **Regulators**: These monitor, maintain, or control the speech of someone else. Examples include the hand movements for *Keep going, Slow down, What else happened?*
5. **Adaptors**: These are used to satisfy some need. Examples include scratching one's head when puzzled, rubbing one's forehead when worried, and so on.

Some societies have developed complementary 'gesture languages.' These share structural and semantic features with vocal languages. One of the best-known examples is the hand language developed by the Plains people of North America as a means of communication between tribes with different vocal languages. The manual signs represent things in nature, ideas, emotions, and sensations. For example, the sign for a white person is made by drawing the fingers across the forehead, indicating a hat. Special signs exist also for each tribe and for particular rivers, mountains, and other natural features. The sensation of cold is indicated by a shivering motion of the hands in front of the body, and the same sign is used for 'winter' and for 'year,' because the Plains peoples count years in terms of winters. Slowly turning the hand, relaxed at the wrist, means vacillation, doubt, or possibility; a modification of this sign, with a quicker movement, is the question sign. The hand language is so elaborate that a detailed conversation is possible using the gestures alone (Mallery, 1972).

Gestures may also be used for sacred symbolic purposes, revealing the ancientness and thus 'mythic symbolism,' associated with hand communication. For example, in Christianity the 'sign of the cross' is a gesture that aims to recreate the central event of Christianity – the Crucifixion. In Buddhism, the gestures known as *Mudras* are used during ceremonies to represent meditation, reasoning, doctrine, protection and request, enlightenment, unification of matter, and spirit. The 'devil's hand,' with the index and little finger raised, on the other hand, belongs to the domain of superstition, symbolizing, in some cultures, a horned figure intended to ward off the evil eye and in others a sign of 'cuckoldry.'

Facial Expression

Probably inspired by general work in kinesics, in 1963, psychologist Paul Ekman established the Human Interaction Laboratory in the Department of Psychiatry at the University of California at San Francisco for the purpose of studying one particular aspect of kinesic behavior – facial expression. He was joined by Wallace V. Friesen in 1965 and Maureen O'Sullivan in 1974. Over the years, Ekman and his team have identified, for example, certain facial expressions as universal signs of specific emotions (e.g., Ekman, 1980, 1982, 1985, 2003; Ekman and Friesen, 1975). They have shown this by breaking down facial expressions into characteristic components – eyebrow position, eye shape, mouth shape, nostril size, etc. – which in various combinations determine the form and meaning of the expression. Ekman and his team have, over the years, found very little variation across cultures in the nature of the components and in their combinations. Indeed, they have shown that it is possible to write a 'grammar' of the face that shows less cross-cultural variation than do language grammars (Peck, 1987).

Conclusion

Kinesics has become an important branch of semiotics because it documents the power of nonverbal signs in regulating how people behave in certain social situations. Such signs are products of both our biological ancestry and of specific cultural histories. The sounds made by the body (sneezing, coughing, burping, etc.), the fluids that issue forth from it, the eye patterns that are used when speaking, the kinds of touching routines humans utilize during discourse, the facial expressions utilized in conveying feelings, and the kinds of gestures and gesticulations that are found throughout the world are all interpreted semiotically as signifiers of both universal and culture-specific meanings. These are the outcome of Nature and Culture cooperating in an exclusive form of partnership.

Discoveries in neuroscience have shown that nonverbal signs are produced and processed differently from words. Spoken language is processed in the cerebral cortex, a more developed area of the brain that is unique to human beings. In contrast, nonverbal cues – such as smiling, staring, and clenching the fists – are processed in lower, more primitive areas such as the limbic system. People often produce and receive nonverbal cues without conscious awareness of doing so.

Because kinesics has produced a substantial and substantive literature, it is now not uncommon to separate the various areas mentioned in this entry into separate subfields. For example, gesture is now studied separately. Similarly, the study of facial expression and touching patterns are treated as separate areas of investigation.

Kingman Reef: Language Situation

Editorial Team

Wet or awash most of the time, with a maximum elevation of approximately 1 m, Kingman Reef is situated in the North Pacific Ocean, about half way between Hawaii and American Samoa. An unincorporated territory of the United States, Kingman Reef is administered from Washington by the Fish and Wildlife Service of the Department of the Interior. It is completely uninhabited, but marine flora and fauna thrive there. Kingman Reef was used for a brief period in the 1930s as a halfway station for Pan American Airways flying boats.

Kinship Expressions and Terms

J G Heath, University of Michigan, Ann Arbor, MI, USA

All languages have expressions that can be glossed 'father,' 'wife,' 'brother-in-law,' etc., covering consanguineal, spousal, and affinal categories. However, from the beginning of serious cross-cultural study, it has been apparent that societies differ in the kinship categories used. To facilitate comparison, an 'etic grid' is necessary; namely, an open-ended universe of kin-types, such as 'father's sister,' corresponding to the denotata of the infinitely expansible possessive construction seemingly found in all languages. The minimal nuclear components are parent (Pa), child (Ch), and spouse (Sp), a combinatory algorithm (PaPaSp = parent's parent's spouse), and cross-cutting features, including sex of referent (Ch + female = daughter), sex of linking relative (male linking relative + Ch + female = man's daughter), and relative age within a generation (PaSb + senior = senior sibling). The initial linking relative (e.g., *you* in *your father*) is referred to as 'ego' or 'propositus.'

In practice, most anthropologists and linguists operate with atomic categories based on a prototypical set of flesh-and-blood nuclear family members: Fa(ther), Mo(ther), Br(other), Si(ster), So(n), Da(ughter), Wi(fe), and Hu(sband). Combinations are then of the type FaMoBrWi (father's mother's brother's wife).

This grid permits analysis of the denotational scope of each kin term and, ultimately the entire system, by identifying the complete set of kin-types onto which the term maps. Some terms, such as English *mother* and *brother*, denote unique kin-types. Others, such as English *uncle*, correspond semantically to finite sets of kin-types. However, in languages with 'classificatory' kin-term systems, each such term maps onto an unbounded set of kin-types. With such languages, a common approach is to generate the more complex kin-types from simpler ones by expansion rules that link kin-types closer to propositus, with kin-types in the denoted set farther away; doing so entails converse reduction rules that go from complex to simple types. If in a system the term for MoBrDa expands to include MoMoBrDaDa, then conversely, MoMoBrDaDa reduces terminologically to MoBrDa; they are both denoted by the same term in such a system of terms.

Kinship Systems

Ideally, one can elicit the kinship system of a previously unstudied language by sitting down with an informant for a few hours, presenting a reasonable range of kin-types (perhaps using the informant's actual kin), and recording the corresponding kin terms. A great milestone in kinship study, still widely mined for data, was Morgan's (1870) analytical compendium of term/kin-type mappings from American Indian languages based on detailed questionnaires filled out by local correspondents (Trautmann, 1987). In interdisciplinary museum expeditions, such as those led by Alfred Haddon in the South Pacific in the first decades of the 20th century, it was common to include an anthropologist who would rapidly record the 'social structure' – that is, the kinship terminology – of each tribe visited in this fashion.

The resulting systems were taken as reflecting synchronic native models of how the societies worked, with particular reference to matriliny versus partriliny and to such issues as bigamous marriage involving sibling groups. However, because kin-term systems were often mismatched with observable social practices, ethnologists inferred that the kin terms could reflect social structures from an earlier age that were preserved in linguistic formaldehyde. Evolutionary models were later dismissed in favor of synchronic interpretations, first by early functional-structuralists (e.g., Radcliffe-Brown, 1924, 1950), and later by high structuralists (Lévi-Strauss, 1949) under the influence of linguistic structuralism. In recent decades, anthropology has become heavily concerned with historical processes, which has been reflected in a revival of interest in the evolution of kinship systems (Dole, 1972).

As an example of kinship typology, consider the three male kin-types: Fa, FaBr, and MoBr. The following four groupings are attested: (1) all three terminologically distinct (Sudanese systems); (2) Fa versus {FaBr, MoBr} (Eskimo systems, as in English), emphasizing the distinction between direct and collateral lines; (3) {Fa, FaBr} versus MoBr (Iroquois systems), known technically as bifurcate merging, merging same-sex siblings; and (4) all three merged into one category (Hawaiian systems), emphasizing generation. A hypothetical fifth system with (Fa, MoBr) terminologically distinguished from FaBr is unknown. The treatment of female kin-types Mo, MoSi, and FaSi is almost always parallel within a given system type; for example, Iroquois systems distinguish {Mo, MoSi} from FaSi. Usually (but not always), parental-generation kin-types that are merged terminologically as referents are also undifferentiated as linking relatives. For example, the child of an *uncle* (whether MoBr or FaBr) is *cousin* in English.

Two initially baffling systems show the same (bifurcate merging) cuts as Iroquois among the six primary parental-generation kin-types, but skew their extensions to lower generations. Crow systems have a matrilineal skewing rule by which SiSo or (woman's) So is terminologically merged with Fa; note that (ego's) Fa and SiSo are in the same matrilineal descent group, which differs from ego's own. Omaha systems have a structurally similar patrilineal skewing rule; for example, merging MoBrDa with Mo, both of whom are in ego's Mo's patrilineal descent group.

Meaning of Kin Terms

One is naturally drawn to seek explanations for this cross-linguistic variation in the form of correlation with cross-cultural differences in social practices. However, doing so turns out to be more difficult than it seems. To begin with, there are at least four social parameters that might be considered: (1) society-wide descent groups (matrilineal or patrilineal), including binary divisions (moieties); (2) marriage rules; (3) postnuptial residence (e.g., with the father of the bride); and (4) inheritance (e.g., from father to son). Unfortunately, these social phenomena operate at different levels and are often nuanced and negotiable, rather than binaristic and rigid. Although the parameters may sometimes converge (e.g., patrilineal descent, patrilocal residence, father-to-son inheritance), there are many cases where they do not. The structural-functional interpretation of "a kinship system as a working system linking human beings together in an orderly arrangement of interactions" (Radcliffe-Brown, 1950) has been plagued by evidence that certain kin terms lump together kin-types associated with quite different behaviors and affective relations.

Yet, it seems reasonable to suppose that kin-term semantics and prevailing sociocultural practices are not unrelated. For example, the fact that Americans have unique terms for parents, but lump the siblings of these parents (and even the spouses of these siblings) together as *aunt* and *uncle*, correlates with the autonomy of the nuclear family in this society. Likewise, societies that have well-developed descent systems and, say, a formalized levirate by which orphaned children are adopted by a brother of the deceased father, are good candidates for systems with Fa = FaBr (distinct from MoBr).

The suggestive but imperfect correlations between terminology and sociocultural practices have led to deep divisions among anthropologists as to what kin terms 'mean.' At one pole are exponents of formal kinship semantics, who argue that kin terms constitute autonomous formal systems, decomposable into nuclear primitives and expansion/reduction rules as sketched above. One of the founders of this approach, Floyd Lounsbury, demonstrated that this generative model provided the first accurate analysis of Morgan's Crow- and Omaha-type data, permitting the identification of previously unsuspected parametric variants within both (1956, 1964a, 1964b). He showed that previous attempts to explain these systems using sociocultural correlations were empirically inaccurate beyond the simplest kin-types. Lounsbury's model was later extended by Harold Scheffler to Australian Aboriginal and other difficult systems (1971, 1978).

The modularity of this approach was countered by other anthropologists who argued that sociocultural contextualization was needed. The most outspoken critic, David Schneider (1968, 1984), questioned the core assumption of the formalists; that is, universal concepts of marriage and procreation (or conception) as the foundation of nuclear basic kin-types (for assessments, see Feinberg and Ottenheimer, 2001). For Schneider, kinship systems are based on subjective and therefore culture-specific concepts; for example, Americans have a distinctive notion of blood at the center of their kinship system. Schneider and others emphasized the ways different cultures recognize paternity (and even maternity), citing the widespread nonbiological uses of kinship concepts (e.g., *father* as applied to God, to George Washington, or to priests), and arguing that anthropologists must discover these concepts through sensitive participant-observation. Similar attacks on universal 'marriage' were launched by British anthropologists (Needham, 1971).

Ethnographic complications include spirit-child conception, god-parents, compadres and comadres, co-spouses, ex-spouses, adoption, step-kin, namesake relationships, formal renunciation of genealogical relationships, and tightly knit brotherhoods and sisterhoods. Recent phenomena (gay marriage, artificial insemination, test-tube babies, surrogate mothers, and cloning) add further layers of complexity.

Cognitive Semantics

Cognitive anthropologists and linguists have grappled with tensions between extralinguistic conceptual structure and lexical categories (Miller and Johnson-Laird, 1976), and have of course reexamined kinship among other domains. Prototype theory has been influential, but no clear consensus on kinship semantics has emerged.

Hirshfeld (1984) argued that a formalist model based on genealogical primitives is inconsistent with

cognitive theories of meaning. He dismissed the claim that nongenealogical uses of kin terms are (experienced by natives as) metaphorical and pointed out that the time-bound acts of insemination and childbearing fail to account for the enduring nature of kinship bonds. He suggested that normative attributions of parent-child physical resemblance play a key role.

Anna Wierzbicka's theoretical program emphasized a small number of universal lexical primitives, from which the meaning of other lexical items is derived. Addressing kinship (1992), she identified MOTHER, FATHER, HUSBAND, and WIFE as primitives. She partially accepted the argument that the two parental categories are universal, based on cross-cultural recognition of paternal as well as maternal roles in procreation.

Read (1984) argued that American kinship terminology can be modeled as a modular algebraic system independent of its linkage to concrete kin categories (such as kin-types).

Linguistic Studies

Anthropologists have long been aware of terminological reductions and shifts from referential to vocative forms of kinship, generally interpreting them as pragmatic skewings of vocatives. Linguists have now brought out much deeper language-internal complexity. There may be several coexisting subsets of nouns: referential terms (*father*), vocatives (*hey Dad!*), deceased kin (*my late uncle*), bereaved kin (*orphan*), terms for nonhumans, and dyadic derivatives (*mother*-Dyad = a mother and her child). In some languages, these subsystems have their own suppletive terms and/or make different semantic cuts. For example, English *orphan*, *widow*, and *widower* are a defective set of bereaved kin terms; some languages have additional terms with glosses like 'bereaved MoBr.' Tubatulabal (California) has a suffix roughly glossable 'last surviving X' (X = e.g., Br; Voegelin, 1935).

Broad kinship relations among two or more referents may be encoded in nonsingular pronouns. Dalabon (Australia) has two forms for each dual pronominal, as in 'they(Dual)-went,' depending on whether the two referents are 'harmonic' based primarily on generation sets (Alpher, 1982; cf. Koch, 1982 on Kaytej).

One semantic type of kinship verb is glossable 'X calls Y "mother"' (cf. *Don't "mother" me!*). Another is glossable 'X mothers Y,' where (depending on the language) X is any of Y's (classificatory) mothers, X is Y's actual (prototypical) mother, or X behaves like a mother to Y. Sometimes at least certain 'referential kin terms' are morphological verbs or relative clauses (Amith and Smith-Stark, 1994; Evans, 2000). Even in other languages, the precise semantics of such verbs as 'bear/sire (child)' clarifies the conceptual foundations of kinship.

Whenever speaker S and addressee A are both related to a referent R, there is a choice between egocentric ('my . . .') and altercentric ('your . . .') perspectives. Actual usage may be controlled by pragmatic principles, but these can be intricate (Merlan, 1982). The forced choice between the two perspectives is obviated in some Australian languages in which 'triangular' kin terms simultaneously specify S's and A's relationships to R (Laughren, 1982; Merlan, 1989).

Special registers can be associated with speech to (or in the presence of) particular kin: bawdy registers for 'joking relationships' or respectful registers used in the presence of senior affines. These registers may have extensive vocabularies, including suppletive kin terms, thereby usually making a reduced set of distinctions (Dixon, 1971). The same applies for registers associated with male initiation rites (Hale, 1982).

Kinship categories may be associated with body parts. In this case, touching the body part may replace the spoken term, in isolation, or timed to fill a 'slot' in an utterance (Heath, 1982). These kin/body associations are metonymic, alluding to stereotypical behaviors (carrying in the womb, carrying piggyback, sleeping thigh to thigh, averting one's eye). The fact that carrying in the womb is treated as just one among several bodily interactions suggests that the sharp distinction between 'genealogical/biological' and 'affective/behavioral' levels of meaning in anthropological kinship studies may be misguided.

Kinyarwanda

A Kimenyi, California State University at Sacramento, Sacramento, CA, USA

General Background

Kinyarwanda, the national language of Rwanda is probably, after Swahili the second largest spoken language in the Bantu group. It is a sister dialect of Kirundi, the national language of Burundi, and Giha, another dialect spoken in Tanzania. Despite the genocide that took place, taking the lives of more than 1 million Tutsi, it is spoken by perhaps more than 20 million people. Rwanda has approximately 9 million people right now, Burundi has approximately 7 million, but besides the Giha speakers there are also ethnic Banyarwanda in Southern Uganda in the Kigezi district known as Bafumbira. Other Kinyarwanda speakers are Banyamulenge in Southern Kivu, ethnic Banyarwanda in Masisi, and Rutshuro in Northern Kivu in the Democratic Republic of Congo. Kinyarwanda belongs to the interlacustrine (Great Lakes) Bantu languages.

Writing System

Although Kinyarwanda has both long vowels and short vowels as well as high tones or no tones on syllables, the official orthography does not mark

Kinyarwanda

A Kimenyi, California State University at Sacramento, Sacramento, CA, USA

General Background

Kinyarwanda, the national language of Rwanda is probably, after Swahili the second largest spoken language in the Bantu group. It is a sister dialect of Kirundi, the national language of Burundi, and Giha, another dialect spoken in Tanzania. Despite the genocide that took place, taking the lives of more than 1 million Tutsi, it is spoken by perhaps more than 20 million people. Rwanda has approximately 9 million people right now, Burundi has approximately 7 million, but besides the Giha speakers there are also ethnic Banyarwanda in Southern Uganda in the Kigezi district known as Bafumbira. Other Kinyarwanda speakers are Banyamulenge in Southern Kivu, ethnic Banyarwanda in Masisi, and Rutshuro in Northern Kivu in the Democratic Republic of Congo. Kinyarwanda belongs to the interlacustrine (Great Lakes) Bantu languages.

Writing System

Although Kinyarwanda has both long vowels and short vowels as well as high tones or no tones on syllables, the official orthography does not mark

vowel length and melody. Only the context can tell the reader which word was meant. Written texts are thus ambiguous even to native speakers. Thus, the written word *gusura* can stand either for (*gusura*) 'to fart' or (*gusuura*) 'to visit', and *gutaka* can stand for either (*gutaka*) 'to scream' or (*gutaaka*) 'to decorate'; *ino* can stand for either (*ino*) 'toe' or (*inó*) 'here', *inda* can stand for (*inda*) 'stomach' or (*indá*) 'louse', *umuryango* can stand for (*umuryaango*) 'family' or (*umuryáango*) 'door', and *ikirere* can stand for (*ikireere*) 'banana leaf' or (*ikiréeré*) 'air space'. Even though the sound 'p' has been lost and is found only in onomatopoeic words and loan words, the aspirated voiceless velar fricative 'h' is spelled as 'p' after the bilabial nasal 'm', as shown in the examples *impuha* (*imhuuha*) 'rumors', *impamvu* (*imhaámvu*) 'cause/reason'. The allophones, the voiced bilabial stop 'b', which appears only after the homorganic nasal 'm', and the voiced bilabial fricative a, realized intervocalically, are also written the same way, using the voiced bilabial stop symbol 'b'. Although the language has only one liquid, both 'r' and 'l' are used in the orthography. The liquid 'r' is used in all texts and 'l' is used only in loan words that have 'l' in their spelling, such as *Libiya* 'Libya', *Alijeriya* 'Algeria', *dolari* 'dollar'.

Vowels and Consonants

Kinyarwanda has five vowels, which are either long or short and are high-toned or have no tones. The high tone can appear on either the first mora or the second mora. These vowels are the two high vowels 'i' and 'u', the midvowels 'e' and 'o', and the center low vowel 'a'. The midvowels 'e' and 'o' are not allowed in both the (pre)prefix and suffix positions. In verbs, however, these midvowels can appear in the suffix position as a result of vowel harmony if the vowel of the verb stem is a midvowel, e.g., *gukosa* 'to make mistakes', *gukosoora* 'to correct' /ku-kos-uur-a/; *kumenya* 'to know', *kumenyeesha* /ku-meny-iish-a/.

The majority of word stems have the same identical vowel in all syllables: *u-mu-biri* 'body', *u-bu-riri* 'bed, *i-ki-reenge* 'leg', *i-béere* 'breast', *u-mu-góongo* 'back', *u-mu-hoondo* 'yellow', *u-ku-guru* 'leg', *u-ru-túgu* 'shoulder', *igihaánga* 'skull', *i-ki-gaanza* 'hand palm'. This observation raises the question as to whether the stem is assigned only one vowel that is copied or that spreads to other syllables.

Since Kinyarwanda has open syllables only, loan words with cluster consonants copy the vowel of the syllable on the right or a default vowel 'u' with bilabial consonants and 'i' with other consonants. As the following loan word *porogaramu* 'program' shows, both vowels 'o' and 'a' are copied on the preceding vowelless consonants and the vowel 'u' is inserted after the final consonant 'm'.

'program' /p.$ro.$g.$ra.$m.$/ > *porogaramu*

This language has both simple and complex consonants. The simple consonants, using the official orthography, are the bilabials 'p', 'b', and 'm', the interdentals 'f' and 'v', the alveolars 't', 'd', 's', 'z', and 'n'; the alveopalatals 'sh', and 'j', and the velars 'k', 'g', and 'h'. Kinyarwanda has two glides, the palatal 'y' and the bilabial 'w'. It has one liquid, 'r', which is written as 'l' in some loan words, as was pointed out earlier. The affricates are the labiodental 'pf', the alveolar 'ts', and the palatal 'c'.

The complex consonants are the prenasalized simple consonants, the palatalized consonants, the velarized consonants, the palatalized–velarized consonants, the prenasalized palatalized consonants, and the prenasalized palatalized–velarized consonants.

Prenasalized consonants are the bilabial 'mp' and 'mb'; the interdental 'mv', 'mf', and 'mpf'; the alveolar 'nt', 'nd', 'ns', 'nz', and 'nts'; the palatal 'nsh', 'nj', and 'nc'; and the velar 'nk', 'ng', and 'nshy'.

Palatalized consonants are the bilabial 'by', 'py', and 'my'; the interdental 'fy'; the alveolar 'ty', 'dy', 'sy', and 'nny'; and the velar 'cy', 'jy', and 'shy'.

The velarized consonants are the bilabial 'pw', 'bw', and 'mw'; the interdental 'fw' and 'vw'; the alveolar 'tw', 'dw', 'sw', 'zw', 'nw', 'rw', and 'tsw'; the palatal 'shw', 'jw', 'cw', and 'yw'; and the velar 'kw', 'gw', and 'hw'. Palatalized–velarized consonants are the bilabial 'byw', 'pyw', and 'myw'; the alveolars 'tyw', 'dyw', 'syw'; and the velar fricative 'shyw'. Palatalized consonants, velarized consonants, and palatalized–velarized consonants can in turn be prenasalized as shown in the following examples: 'mbyw' (prenasalized palatalized–velarized voiced bilabial), 'mvyw' (prenasalized palatalized–velarized voiced interdental, 'nshyw' prenasalized palatalized–velarized voiceless fricative velar, and 'njyw' (prenasalized palatalized–velarized voiced stop velar). The complex consonants in Kinyarwanda are discussed at great length in Kimenyi (2002) and Bizimana *et al.* (1998). It is still an open debate in phonetics and phonology as to whether these complex consonants are one with multiple articulators or a sequence of independent segments.

Tonology

Role of Tones

Tones are lexical, morphological, and syntactical. Lexical tones differentiate words that look alike segmentally as shown in (1), morphological tones play

the role that segmental morphemes are assigned in other languages as illustrated in (2), whereas syntactic tones are assigned depending on where the word bearing the tone occurs in the noun phrase, verb phrase or the sentence as shown in (3):

(1) *inda* 'stomach' <> *indá* 'louse', *ino* 'toe' <> *inó* 'here'

(2) *basoma* 'they read' <> *basomá* 'who read' <> *básoma* 'when they read'

(3) *baraaza bagakóra* 'they come and work' <> *baraaza bagakora akazi* 'they come and do the work'

In (2), the lack of tone shows the present tense, and the high tone on the second syllable shows that the verb is a relative clause, whereas the high tone on the first syllable of the verb stem shows that the verb is a temporal or conditional clause. In (3), the verb loses its high tone because it is followed by a complement.

Tone Rules

Tone rules in Kinyarwanda were thought to be complicated. However, when looked at very closely, they are very simple. There is only one lexical high tone per morpheme. Some morphemes are toneless. Noun tone patterns differ from verb tone rules. Any noun can have a lexical high tone on any syllable of the stem, except the augment and the prefix. A verb, however, even when it is polysyllabic and has multiple suffixes, can have a high tone only on the first mora of the first syllable or the first of the second syllable of the stem. Other syllables are extraprosodic. When high tones are found there, they are stray tones, since they do not participate in tone rules such as the Meeussen rule, Beat Movement, Iambic Reversal, etc. The first syllable verb high tone assignment is lexical, whereas the second syllable high tone assignment is grammatical. The prosodic domain of tone rules application of both nouns and verbs is the leftmost phonological tone and the first mora of the stem first syllable. Tone rules apply from right to left, whereas in the majority of languages whose tone rules have been studied, they apply from left to right.

Nouns can obtain a secondary and a tertiary tone. A secondary high tone is assigned on the first mora of the noun stem if the lexical high tone is at least two or more mora away from the first noun mora.

isáandukú 'box' ← /i-saandukú/, *inkókorá* 'elbow' ← /i-n-kokorá/
aug-box aug-CL9-elbow
abasásamígozí 'murderers'
/a-ba-sas-a+i-mi-gozí/
aug-sub.pr.-make bed-asp+aug-CL4-rope
inshóberamáhaánga 'idiomatic expressions'
/i-n-shober-a+a-ma-haánga/
aug-CL9-disorient-asp+aug-CL6-foreign countries

A noun can thus have only a maximum of three phonetic high tones.

What makes verb tones seem complex is the assignment of the tense–aspect–modality morphemes. Some tenses or moods erase lexical tones, thus making the whole finite verb toneless, or assign tones to toneless verb stems, making both toneless verb stems and high-toned verb stems look the same. As shown below, the verb stem *-kin-* 'play' and *-kór-* 'work/do' are neutralized, becoming toneless or both bearing a high tone in some tenses.

ntibagikora 'they do not work anymore' <> *ntibagikina* 'they do not play anymore'
baracyáakóra 'they still work' <> *baracyáakina* 'they still play'
bakoré 'they should work'<> *bakiné* 'they should play'.

The metrical domain for verb tone rules is the first mora of the first object pronoun and the first mora of the verb stem for lexical tones and the first mora of the first object pronoun and the first mora of the second syllable of the verb stem. Kinyarwanda is one of the Bantu languages that can have multiple object pronouns.

baranáhabíbamákoreeshereza ← /ba-ra-na-ha-bi-ba-mu–kór-iish-ir-ir-y-a/
they-t-also-there-it-him/her-them-do-appl-caus-appl-appl-caus-asp
'they also make them do it for him/her there'.

Phonology

Phonological Rules Affecting Vowels

Phonological rules affecting vowels are vowel deletion, vowel coalescence, gliding, vowel harmony, vowel shortening, and vowel lengthening.

When a word or morpheme that ends with a vowel is followed by another one that also starts with a vowel, the final vowel of the word or morpheme on the left is always deleted.

Vowel coalescence takes place within a word if there is a sequence of two morphemes ending with the central low vowel 'a' and starting with the high vowels 'i' and 'u', respectively: 'a + i' becomes 'e' and 'a + u' becomes 'o', e.g., *améenyo* /a-ma-íinyo/ 'teeth'.

Gliding takes place within words or clitics if in a sequence of two vowels the first one is a high vowel ('i', 'u') or a round vowel ('u', 'o'), thus becoming 'y' for the front high vowel and 'w' for round vowels, e.g., *harimó amáazi* > harim$^{w'}$áamáazi 'there is water

in it'; *i-ki-úuma* > ik^{y}úuma 'knife'; /*u-bu-oónko*/ > ub^{w}oónko 'brain'. Vowel harmony affects vowels in the suffix position. If the suffix vowel is high ('i', 'u') it becomes mid ('e', 'o', respectively), if the word stem vowel is a mid vowel, e.g., *gukóra* /ku-kór-a/ 'to work' > *gukóreesha* /ku-kór-iish-a/ 'to cause to work/ employ/use', *kumenya* /ku-meny-a/ 'to know' > *kumenyeesha*/ku-meny-iish-a/ 'to let know/inform'. Vowels in Kinyarwanda are always short in the beginning and final positions of words. They always lengthen before prenasalized consonants and after palatalized and labio-velarized consonants (Kimenyi, 1979, 2002).

Phonological Rules Affecting Consonants

Phonological rules affecting consonants are assimilation, dissimilation, known as Dahl's Law, fricative spread, deletion, and insertion. As in other Bantu languages, reduplication is also very productive in Kinyarwanda.

Consecutive consonants acquire the same voice, manner, and place of articulation phonetic features. Nasals take the place of articulation (labial, velar, palatal, velar) of the consonant on the right. Consonants obtained through the palatalization or velarization process also agree in voice, nasality, and place of articulation with the governor consonant.

gukúbita 'to hit' > *gukúbitkwa* 'to be hit' /ku-kubit-w-a/

kudóda 'to sew' > *kudódgwa* 'to be sewed' /ku-dód-w-a/

kubóna 'to see' > *kubónnwa* 'to be seen' /ku-bón-w-a/.

If a word has a palatalized fricative in one of the syllables on the right, fricatives in preceding syllables become palatalized as well.

gusoonza /ku-soonz-a/ 'to be hungry' > *gushoonjeesha* /ku-soonz-iish-a/ 'to cause hunger'

basuuzugura /ba-suuzugur-a/ 'they despise' > *bashuujuguje* /ba-suuzugur-ye/ 'they just caused to despise'.

This phenomenon argues for the autosegmental treatment of phonological rules because as the provided examples show, these fricatives do not have to be in adjacent syllables.

Reduplication is both lexical and grammatical. Lexical reduplication consists of stems that are already reduplicated. Grammatical reduplication affects the stem. In verbs, it is very productive with verbs of movement or sound to show repetition, iterativity, or intensity.

Reduplication is achieved by either repeating the fist syllable or the whole stem.

gutuumba 'to swell' → *gututuumba* 'to start swelling'

kugeenda 'to go'/'walk' → *kugeendageenda* 'to walk around'

ukwéezi 'moon/month' → *icyéezeezí* 'moonlight'

ubusá 'nothing' → *ubusáabusá* 'very little quantity'.

Morphology

Noun Morphology

Kinyarwanda has 16 classes. Modifiers (adjectives, demonstratives, numerals, possessives) agree with the head noun by taking this class marker.

In some cases, however, the class marker has different phonetic forms depending on the grammatical category of the modifier, as illustrated in Table 1. The sentence in (2) in Table 1 shows how this type of noun class agreement works. The head noun *abagabo* (a-ba-gabo) 'men' with class 2 prefix-ba-has it copied to all modifying elements (adjectives, subject pronouns, object pronouns, etc.).

bá-no	*ba-gabo*	*ba-tatu*	*ba-gufi*,
these	men	three	short

mu-ra-bá-bon-a,	ba-mez-e nééza b-óose.
you-pres-them-see-asp	they-are-asp well all

'These three short men, you see them, they are all of them doing well".

Table 1 Allomorphic variation of the nominal prefix according to its function

	Noun	*Adjective*	*Object pronoun*	*Demonstive*	*Possessive*
1.	u-mu-	mu-	-mu-	u-	u-
2.	a-ba-	ba-	-ba-	ba-	ba-
3.	u-mu-	mu-	-wu-	u-	u-
4.	i-mi-	mi-	-yi-	i-	i-
5.	i-ri-	ri-	-ri-	ri-	ri-
6.	a-ma-	ma-	-ya-	a-	a-
7.	i-ki-	ki-	-ki-	ki-	ki-
8.	i-bi	bi-	-bi-	bi-	bi-
9.	i-n-	n-	-yi-	i-	i-
10.	i-n-	n-	-zi-	zi-	zi-
11.	u-ru-	ru-	-ru-	ru-	ru-
12.	a-ka-	ka-	-ka-	ka-	ka-
13.	u-tu-	tu-	-tu-	tu-	tu-
14.	u-bu-	bu-	-bu-	bu-	bu-
15.	u-ku-	ku-	-ku-	ku-	ku-
16.	a-ha-	ha-	-ha-	ha-	ha-

Note: The numbers 1–16 correspond to traditional conventional Bantu noun classification.

The Use of the Preprefix The preprefix or augment usually does not have any semantic function. Some Bantu languages such as Kiswahili do not have it. In Kinyarwanda, it is deleted, after demonstratives, in the vocative case and in onomastics (name creation). Within certain words, however, its absence marks definiteness and its presence indefiniteness.

mugaanga 'the doctor' > *umugaanga* 'a doctor'
munywáanyi 'the buddy' > *umunywáanyi* 'a buddy'
mugeenzi 'the friend' > *mugeenzi* 'a friend'
mwaarimú 'the teacher' > *umwáarimú* 'a teacher'

The absence of the preprefix bleeds tone rules and its absence feeds them. The secondary tone assignment on the first more of the noun stem takes place only if it has a preprefix.

Noun Derivation with the Prefix Kinyarwanda nouns have a small number of suffixes. The most productive one is *-kazi*, which is added to the stem to show feminine, e.g., *umunyarwaanda* 'Rwandan'<> *umunyarwaandakazi* 'female Rwandan', *umwáarimú* 'teacher' <> *umwáarimúkazi* 'female teacher'.

Derivation is productive with the preprefix that creates new words that are either metaphorically or metonymically related to the original noun as shown by the stem-ntu in the following examples: *umuuntu* 'person', *ikiintu* 'object', *ukuuntu* 'manner', *ubuuntu* 'generosity', *ahaantu* 'place'.

Verb Morphology

The simple Kinyarwanda verb form consists of the subject pronoun, the verb stem, and the aspect marker. The aspect marker is either -a(ga) (imperfective aspect) or -ye (the perfective aspect as seen below. The -aga suffix is used in past tenses only and is not used in Kirundi.

basoma (ba-som-a) 'they read';
basomaga /ba-a-som-aga/ 'they were reading';
basomye (ba-som-ye) 'they just read'.

The complex form consists of the preprefix, the subject pronoun, the tense–aspect–modality (TAM) morphemes, the object markers, the reflexive pronoun -i-, the verb stem, the lexical verb extensions, the grammatical morphemes, the aspect marker and the postsuffixes -mó, -hó, or -yó.

The preprefixes are either the morpheme nti- or ni-, negative and temporal morphemes, respectively. The TAM morphemes show time, mood or aspect. Two TAM morphemes can occur in the same slot. Kinyarwanda can have multiple object pronouns, multiple lexical verbal extensions, and multiple grammatical suffixes. Lexical extensions such as -agur-, -iir-, uur, -aang, iriz-, etc., add lexical information, such as inchoativity, iterativity, repetitivity, intensity, frequentativity, reversivity. Grammatical morphemes, such as the causative morpheme -iish-, the applicative morpheme -ir-, the comitative/reciprocal morpheme -an-, can be added to any verb stem. The following sentence serves as an example to illustrate a verb with multiple object pronouns and multiple grammatical suffixes:

Umugoré a-ra-na1-ha2-ki3-zi4-ba5-ku6-n7- som-eesh-eesh-er-er-eza
woman she-pres-also1-there2-it3-it4-them5-you6-me7-read-caus-caus-appl-appl-asp
'The woman is also making them use it to do it for me for me there'.

Lack of Adjectives Kinyarwanda has a handful of adjectives (less than 20). What is expressed by adjectives in other languages is rendered by either the possessive construction (X of Y) or the relative clause construction.

'a poor person' :	*umuuntu*	*w'úmukené*
	person	of poor
	umuuntu	*ukénnye*
	person	who-is poor

Ideophones Ideophones are common not only in Bantu languages but also in the whole Niger–Congo language family. They are different from onomatopoeias, which imitate sounds of nature. They can express different concepts that do not have anything to do with sound by using sound symbolism, short or long vowels, reduplication, triplication, or quadruplication. They can also have different grammatical functions.

umuseké *weerá de*.
dawn which-is clear (ideophone)
'a very clear dawn'
icyáayi *tsiritsiri*
tea ideophone
'a very dark coffee'.

Unclassified Categories As was pointed out earlier, Kinyarwanda has a handful of adjectives. It is the same with function words as well, namely, auxiliaries, prepositions, conjunctions, and subordinators. These are expressed by noun phrases or verb phrases. In most cases, the structure tells whether the noun or verb is the noun or the verb or a function word.

muu nsií y'{á}am{é}ez{á}
under earth of table
'under the table'

baravúgana usíibye kó batabonána.
they-talk-to-each-other you-are-absent that they-do not see each other
'they talk to each other except that they do not see each other'.

Stems of nouns, verbs, and unclassified words can have different phonetic variations, as the word for diploma shows:

diploma: *dipóroómi*, *dipóromá*, *dipóromé*, *dipóromí*, *dipóromó*, *dipóromú*, *dipóroóma*, *dipóroóme*, *dipóroómu*, *dipóroómo*, *diipóroómu*, *diipóroómo*, *diipóroóme*, *diipóroómi*, *diipóroóma*.

It is still an unsolved question for Kinyarwanda lexicographers to decide which form should be considered the main form or whether all forms should entered in the dictionary as independent lexical entries.

Syntax

Kinyarwanda, like other Bantu languages, is a SVO language. Modifiers follow head nouns. What is interesting about this language, as pointed out in Kimenyi (1980, 2002), is the existence of (a) the subject–object reversal, (b) the wh-question *in situ*, (c) the lack of relative pronouns, (d) serialization, and (e) the existence of multiple direct objects.

Object–Subject Reversal and Existential Construction

The object–subject reversal consists of interchanging the object and the subject positions, whereas the existential construction puts both the subject and the object after the verb, prefixing the verb with the locative morpheme ha-(CL16). Neither construction changes the meaning, except that focus is on the object.

Umwáana a-ra-som-a igitabo.
'The child is reading the book'.
child s/he-t-read-asp book
Igitabo ki-ra-som-a umwáana.
'The book is reading the child'.
book CL7-t-read-asp child
Ha-ra-som-a igitabo umwáana.
'It is the child who is reading the book'.
CL16-t-read-asp book child

The object–subject reversal and the existential constructions have the same function as the passive, which is shown by the suffix -w- added to the verb just before the aspect marker.

Igitabo ki-ra-som-w-a n'úumwáana.
'The book is being read by the child.'
book CL7-t-read-pass-asp by child

Wh-Question *In Situ*

In Kinyarwanda and many other Bantu languages, wh-questioning is only allowed *in situ*.

W-iit-w-a nde?
you-call-pass-asp who
'you are called who?' > 'What is your name?'

Ba-tuu-ye he?
they-live-asp where
'Where do they live?'

Lack of Relative Pronouns

Kinyarwanda does not have relative pronouns. Relative constructions are marked by a high tone on the verb stem instead.

Abáana ba-som-á ibitabo.
children they-read-asp/rel books
'The children who read books'.
Ibitabo abáana ba-som-á.
books children they-read-asp/rel
'The books that the children read'.

Serial Verb Construction

When multiple verbs precede the sentence main verb, they lose their semantic function and serve as auxiliaries or tense–aspect–modality bearers. This is illustrated by the following sentences:

Ba-a-ri	*bá-tuu-ye*	*bá-saanz-w-e*
they-t-be	they-dwell-asp	they-join-pass-asp
aux^1	aux^2	aux^3
bá-jy-a	*bá-kuund-a*	*gu-pf-a*
they-go-asp	they-like-asp	to-die
aux^4	aux^5	aux^6

ku-dú hamagar-a.
to-us-call-asp
V
'They usually at least called us'.

Mu-siga-ye	*mú-geend-a*	*mú-heerako*
you-stay-asp	you-walk-asp	you-start
aux^1	aux^2	aux^3

mú-du-subiz-a.
from you-us-answer-asp
V
'Now you respond to us immediately'.

Multiple Direct Objects

Kinyarwanda, like many other Bantu languages, can have multiple direct objects. These objects are either inherent or structural.

Recipients or benefactives are introduced directly to the verb without any preposition with some interactive verbs (giving, showing, etc.).

Umugabo a-haa-ye abáana ibiryó
man he-give-asp children food
'The man has just given food to the children'.

Umwáarimú a-r-éerek-a abanyéeshuúri amashusho.
teacher he-t-show-asp students pictures
'The teacher is showing pictures to the students'.

Inalienable possessions can appear as direct objects without any verb extension marker.

Umugoré a-ra-kúbit-a umwáana ukuguru n'ínkoni.
woman sub.pr.-t-hit-asp child leg with stick
Umugoré a-ra-kúbit-a umwáana inkoni ku kuguru.
woman sub.pr.-t-hit-asp child stick on leg
'The woman hitting the child on the leg with a stick'.

As shown by these examples, the inalienable possession '*ukuguru*' and the instrumental '*inkoni*' can appear as either adjuncts or direct objects without any verbal extension.

Structural direct objects are obtained by deleting prepositions of adjunct objects and by adding suffixes such as -iish-, -ir-, or -an- to the verb stem.

Umugabo a-ra-andik-a ibáruwá n'íikáramú
man sub.pr.-t-write-asp letter with pen
Umugabo a-ra-andik-iish-a ikáramú ibáruwá
man sub.pr.-t-write-caus-asp pen letter
'The man is writing a letter with a pen'.

Conclusion

Kinyarwanda is a prototypical Bantu language. It has all the features that characterize this language group. Its main contributions in syntax have been about the nature and function of grammatical relations (Kimenyi, 1980) and in tonology, its contributions have been about the nature of tone, tone representations, and tone rule application (Kimenyi, 2002).

Kirghiz

L Johanson, Mainz University, Mainz, Germany

Location and Speakers

Kirghiz (**qïrγïz tili, qïrγïzča**) belongs to the Northwestern or Kipchak branch of the Turkic language family, more specifically, to its Southern or Aralo-Caspian group. Until the early 20th century, it was called Kara-Kirghiz, whereas Kazakh was referred to as Kirghiz or Kazak-Kirghiz. Kirghiz is spoken in the Kyrgyz Republic (**Qïrγïz Respublikasï**) or Kyrgyzstan (**Qïrγïzstan**) and in parts of Uzbekistan, Tajikistan, China (Xinjiang), the Russian Federation, Kazakhstan, etc. Its main area is the mountainous part of Western Turkistan, the plateaus of the western Tienshan south of Kazakhstan, and the Alay mountain south of Ferghana. The number of speakers amounts to about 3 million, in Kyrgyzstan over 2.5 million.

In spite of the existence of a modern Kirghiz standard language, Russian has remained the dominant language of higher education, administration, and so forth in the Republic. Since Kirghiz was proclaimed the official language of Kyrgyzstan in 1989, it has consolidated its position, acquiring more social functions. In 1996, Russian was made an official language, along with Kirghiz, in territories and workplaces in which Russian-speaking citizens predominate.

Origin and History

It is still unclear to what extent the Kirghiz of today are successors of the Old Kirghiz, the first Turkic people mentioned in Chinese sources and described

Umugabo a-haa-ye abáana ibiryó
man he-give-asp children food
'The man has just given food to the children'.

Umwáarimú a-r-éerek-a abanyéeshuúri amashusho.
teacher he-t-show-asp students pictures
'The teacher is showing pictures to the students'.

Inalienable possessions can appear as direct objects without any verb extension marker.

Umugoré a-ra-kúbit-a umwáana ukuguru n'ínkoni.
woman sub.pr.-t-hit-asp child leg with stick
Umugoré a-ra-kúbit-a umwáana inkoni ku kuguru.
woman sub.pr.-t-hit-asp child stick on leg
'The woman hitting the child on the leg with a stick'.

As shown by these examples, the inalienable possession '*ukuguru*' and the instrumental '*inkoni*' can appear as either adjuncts or direct objects without any verbal extension.

Structural direct objects are obtained by deleting prepositions of adjunct objects and by adding suffixes such as -iish-, -ir-, or -an- to the verb stem.

Umugabo a-ra-andik-a ibáruwá n'íikáramú
man sub.pr.-t-write-asp letter with pen
Umugabo a-ra-andik-iish-a ikáramú ibáruwá
man sub.pr.-t-write-caus-asp pen letter
'The man is writing a letter with a pen'.

Conclusion

Kinyarwanda is a prototypical Bantu language. It has all the features that characterize this language group. Its main contributions in syntax have been about the nature and function of grammatical relations (Kimenyi, 1980) and in tonology, its contributions have been about the nature of tone, tone representations, and tone rule application (Kimenyi, 2002).

Kirghiz

L Johanson, Mainz University, Mainz, Germany

Location and Speakers

Kirghiz (**qïrγïz tili, qïrγïzča**) belongs to the Northwestern or Kipchak branch of the Turkic language family, more specifically, to its Southern or Aralo-Caspian group. Until the early 20th century, it was called Kara-Kirghiz, whereas Kazakh was referred to as Kirghiz or Kazak-Kirghiz. Kirghiz is spoken in the Kyrgyz Republic (**Qïrγïz Respublikasï**) or Kyrgyzstan (**Qïrγïzstan**) and in parts of Uzbekistan, Tajikistan, China (Xinjiang), the Russian Federation, Kazakhstan, etc. Its main area is the mountainous part of Western Turkistan, the plateaus of the western Tienshan south of Kazakhstan, and the Alay mountain south of Ferghana. The number of speakers amounts to about 3 million, in Kyrgyzstan over 2.5 million.

In spite of the existence of a modern Kirghiz standard language, Russian has remained the dominant language of higher education, administration, and so forth in the Republic. Since Kirghiz was proclaimed the official language of Kyrgyzstan in 1989, it has consolidated its position, acquiring more social functions. In 1996, Russian was made an official language, along with Kirghiz, in territories and workplaces in which Russian-speaking citizens predominate.

Origin and History

It is still unclear to what extent the Kirghiz of today are successors of the Old Kirghiz, the first Turkic people mentioned in Chinese sources and described

there as blond and blue-eyed. This group settled on Upper Yenisey. Runiform inscriptions found on the territory of today's Tuva indicate that the first Kirghiz state was, at the beginning of the 8th century A.D., located north of the Sayan mountains. In 840 the Kirghiz ended the old steppe Uyghur empire and established their own empire, which lasted until 920. Most old Turkic groups left this region at the turn of the millennium. A few groups remained in Siberia, (e.g., the ancestors of the Kirghiz and the Altay Turks).

Some Kirghiz tribes may already have moved to the Tienshan region by the 10th century. Other tribes followed, particularly during the Mongol attacks. The Mongol expansion in the 13th century forced old Kirghiz groups to migrate to Western Turkistan and the Tienshan region.

In the following centuries, the tribes referred to as Kirghiz were gradually pushed back by Oirats and Dzungars. In the 16th century, the Kirghiz acted as an important ally of the Kazakh. In the second half of the 17th century, the Yenisey Kirghiz were forced to accept the sovereignty of the Kalmyk. At the beginning of the 18th century, the majority of the Kirghiz migrated to Tienshan. After the breakdown of the Dzungar Empire in 1758, the Kirghiz definitively settled in their present territory. In the 18th and 19th centuries, they were subjects of the Uzbek Khanate of Kokand. They came under Russian supremacy in 1867, and their territory was incorporated into the Russian Empire in 1880. Under the Russian and Soviet rule, numerous Kirghiz emigrated to China. In 1991, the Kirghiz Republic was proclaimed an independent state.

Related Languages and Language Contacts

Kirghiz is closely related to Southern Altay Turkic of South Siberia. Its modern form is also very close to Kazakh as a result of long-standing intensive contacts. Old Kirghiz, as attested to in inscriptions, was similar to Orkhon Turkic and Old Uyghur (*see* **Turkic Languages**). The language was later influenced by Mongolic and especially by Kipchak Turkic. In the 18th and 19th centuries, it was subject to some impact from the Iranicized dialects of the Uzbek area. The contacts with Russian began at the end of the 19th century. After the Kirghiz territory was conquered by the Russian empire in the second half of the 19th century, the Russian influence became predominant.

The Written Language

In the Soviet period, a Kirghiz standard language was developed on the basis of the northern dialects. Before the revolution Kirghiz had already found some limited use as a written language. A modified version of the Arabic script was introduced in 1924 but was given up in 1928 in favor of the unified Roman-based alphabet. A modified Cyrillic-based script was introduced in 1940. In the post-Soviet era, a new Roman-based alphabet was created, but it has not yet replaced the Cyrillic-based script. The Arabic script is used for the variety written in China.

Distinctive Features

Kirghiz exhibits most linguistic features typical of the Turkic family (*see* **Turkic Languages**). It is an agglutinative language with suffixing morphology, sound harmony, and a head-final constituent order. In the following, only a few distinctive features will be dealt with. In the notation of suffixes, capital letters indicate phonetic variation; for example, **A** = **a/e,** and **I** = **ï/i.** Hyphens are used here to indicate morpheme boundaries.

Phonological Features

Kirghiz has a rather regular vowel system, lacking the reduced vowels of Kazakh. The different orthographic vowel representations very often conceal the phonetic similarities between Kirghiz and Kazakh.

Kirghiz exhibits the typical Kipchak labialization of **g/γ**, but does not, as Kazakh, replace them by the glide **w**. As in Altay Turkic, the preceding vowel is deleted and lengthened, as in **to:-lu:** [mountain-DER] 'mountainous' (< **ta:γ-l°γ**), cf. Altay Turkic **tu:-lu:** [mountain-DER], Kazakh **taw-lï** [mountain-DER]. Kirghiz differs from Kazakh by absence of the sound changes **č** > **š** and **š** > **s**. Modern Kirghiz displays initial **ǰ**- instead of older **y**- (e.g., **ǰol** 'way'; cf. Turkish **yol**). This change occurred under the influence of Kazakh, which, however, later changed **ǰ to ž**. Kirghiz does not display the uvular **x** or the glottal **h** but replaces them by **q** or zero in loanwords (e.g., **qabar** 'message' [< **xaber**], **ar** 'each' [< **har**]). Kirghiz has, like some Siberian Turkic languages, a well-developed sound harmony. Suffixes exhibit both front vs. back harmony and rounded vs. unrounded harmony. The choice of suffix vowels is determined by features of the preceding syllable (e.g., **köl-dör-dön** [lake-PL-ABL] 'from the lakes,' **üy-lör-übüz-dö** [house-PL-POSS.1.PL-LOC] 'in our houses'). The rounded vs. unrounded harmony also affects low suffix vowels, which are rounded to **o** and **ö** after **o**, **ö**, **ü** in the preceding syllable. However, **u** in the preceding syllable is not followed by **o** (e.g., **qum-da** [sand-LOC] 'in the sand'). Rounding of low suffix vowels is also

observed in Altay Turkic, Turkmen, Bashkir, and to some extent, in Kazakh, and Noghay.

Morphophonemic alternations are found in suffixes with initial **l** and **n**, which are assimilated to **d** after voiced consonants (with some exceptions after **r** and **y**), and to **t** after voiceless consonants (e.g., **ata-nïn** [father-GEN] 'of the father,' **qar-dïn** [snow-GEN] 'of the snow,' **at-tïn** [horse-GEN] 'of the horse,' **alma-lar** [apple-PL] 'apples,' **kün-dör** [day-PL] 'days,' **at-tar** [horse-PL] 'horses').

Arabic and Persian loanwords have generally been adapted more strongly to the native phonological system than their counterparts in neighboring Turkic languages (e.g., **apta** 'week' [< **hafta**], **ubaqtï** 'time' [< **waqt**]).

Grammar

The Kirghiz genitive suffix -**nIn** ends in -**n**, as in languages of the Southwestern (Oghuz) branch, not in -**ŋ** as in the neighboring languages.

The suffix -**rA:K** (after consonant-final stems -**IrA:K**) is added to adjectives to express comparative degree. The superlative is expressed by means of the preposed element **eŋ** (e.g., **eŋ ǰaqšï** [SUPERL good] 'best'). The normal second-person plural form of the personal pronoun is **si-ler** [you-PL] 'you.' **Siz** is the polite form used for one addressee, and **siz-der** [you-PL] is the polite form for more than one addressee. The corresponding copula suffixes are -**slŋAr**, -**slz** and -**slz-dAr**. Most demonstrative pronouns exhibit an optional -**l** in the nominative; for example, **bu(l)** 'this.' Different degrees of closeness are marked with **bu(l)** (close referents known to the speaker), **ošo(l)** and **ušul** (more remote referents), and **tigi(l)** and **teti-gil(l)** (remote referents outside the conversational setting).

Pronouns also include the reflexive **öz** and the interrogatives **emne** 'what,' **kim** 'who,' **qaysï** 'which,' and so on. A collective suffix -**O:** (with drop of stem-final vowels) is used with the numerals from 1 to 7 (e.g., **ek-ö:** [two-COLL] 'two together'). Distributives are formed with the ablative (e.g., **otuz-dan** [thirty-ABL] 'thirty each'). Approximative and multiplicative numbers can be expressed with -**dAy**, -**čA** and -**LA-GAn** (e.g., **otuz-day** [thirty-APPR], **otuz-ča** [thirty-APPR] 'about thirty,' **ǰüz-dö-gön** [hundred-MULT] 'hundreds').

As in most other Turkic languages, the third-person possessive suffix exhibits the so-called 'pronominal **n**' (e.g., dative -**n-A**, locative -**n-dA**). The past copula particle is **ele** 'was,' instead of **edi** ~ **idi** in other Turkic languages.

The cooperative-reciprocal form in -**(I)š** is also used to indicate the third-person plural of finite verbs (e.g., **ǰaz-ïš-at** [write-PL-PAST.3] 'they write' [singular **ǰaz-at**]), **kel-iš-ti** [come-PL-PAST.3] 'they came' [singular **kel-di** [come-PAST.3.SG]). A general present tense is formed with -**A** + personal markers (e.g., **bar-a-t** [go-PRES-3.SG] 'goes'). A more focal present tense (with a narrower focus on the ongoing event) is formed with- convert + present forms of **ǰat**- 'to lie' (and three other auxiliary verbs) + personal markers (e.g., **bar-a ǰat-a-t** [go-CONV AUX-PRES-3.SG] 'is going'). The suffix -**Dlr** adds a presumptive meaning (e.g., **oyγon-γon-dur** [wake up-POSTTERMINAL-PRES.3.SG] 'has presumably waken up'). An evidential past is formed with- **(I)p-tlr**. A habitual or durative past is formed with- **čl** + personal markers (e.g., **kel-čü-büz** [come-HABIT.PAST-1.PL] 'we used to come'). Intention is expressed by -**MAK-čI** (e.g., **kel-mek-či-min** [come-INTENT-1.SG] 'I want to come'). The system of conjunctions is weakly developed, as Kirghiz has not been under strong Iranian influence.

Lexicon

The basis of the Kirghiz vocabulary consists of Kipchak Turkic elements. Similar to the languages of other nomadic groups, Kirghiz has borrowed numerous Mongolic words as a result of close contacts, especially in the Middle Ages (e.g., **dülöy**, 'deaf'; **belen**, 'ready'; **qara-**, 'to look'). Arabic and Persian words, copied via Chaghatay and Uzbek particularly into the southern dialects, constitute a sizable part of the vocabulary, covering various domains of Islamic culture (e.g., **künö**, 'sin'; **ša:r**, 'city'; **baqča**, 'garden'; **pikir**, 'thought'). The northern dialects, on which the literary language is based, are less influenced by the Islamic vocabulary.

Russian loanwords, which constitute the most recent layer in the lexicon, were introduced from the end of the 19th century on. The use of Russian words is rather dominant in informal spoken standard Kirghiz. Efforts have been made in the last decades to reduce the amount of Russian terms by creating neologisms on the basis of Turkic and Arabic–Persian lexical material or on Russian models. Neologistic suffixes include -**čIl** (e.g., **ulut-čul** [nation-DER] 'nationalist'; from **ulut**, 'nation'), -**GIč** (e.g., **uč-quč** [fly-DER] 'pilot' [from **uč**- 'to fly']).

The variety of Kirghiz spoken in Xinjiang exhibits numerous Chinese loanwords. The written language, however, is largely oriented toward the norm used in Kirghizstan.

Dialects

The Kirghiz dialects can be divided into a southern and a northern group, the latter forming the base

of the standard language. Northern dialects tend toward intervocalic voicening of **s** (e.g., **bala-zï** [child-POSS.3.SG] 'his/her child' instead of **bala-sï** [child-POSS.3.SG]), a feature typical of the South Siberian Turkic languages. The southern dialects, mainly those spoken in the Ferghana basin, show different degrees of Uzbek influence. They lack some characteristic features that separate Kirghiz from other Turkic languages. For example, the glide **w** is preserved in cases in which the standard language only exhibits a long vowel as a trace of a velar that once underwent labialization (e.g., **tow** 'mountain' instead of **to:**) The past copula particle **ede** 'was' is used instead of **ele**. The plural suffix is used in third-person plural forms of finite verb (e.g., **kel-di-ler** [come-PAST-PL.3] 'they came'), instead of **kel-iš-ti** [come-PL-PAST.3]. The 'pronominal **n**' has been lost under Southeastern Turkinc influence. There are also other changes in the nominal inflection. Words copied from Arabic and Persian via Chaghatay and Uzbek have preserved their original phonetic shape to a higher degree than in the northern dialects.

Kiribati: Language Situation

B Palmer, University of Surrey, Guildford, UK

The Republic of Kiribati is a chain of 33 atolls and tiny coral islands straddling the equator in Micronesia in the central-western Pacific north of Fiji. The total land area is about 811 square kilometers scattered across over 5 million square kilometers of ocean.

Kiribati was initially settled over 2000 years ago by Austronesian speakers. The Kiribati remained skilled ocean voyagers, and there is evidence of regular contact with other Pacific groups. However, Kiribati remained isolated from Western influence until the arrival of whalers and missionaries during the 19th century. Formally taken under British control as the Gilbert Islands in 1877, Kiribati became independent in 1979. About one-third of its population lives in the national capital, Bairiki, on Tarawa atoll.

The country is home to one indigenous language spoken by over 97% of its approximately 100 000 inhabitants. The Kiribati language, also known as Gilbertese, is a Nuclear Micronesian language within the Oceanic branch of Austronesian. It is closely related to Ponapean, Kosraean, and Marshallese. The linguistic origin of the Micronesian grouping is not certain, but it is likely to have been in the Solomon Islands or Vanuatu. Kiribati is the most conservative Nuclear Micronesian language, which suggests (along with geography) that it was settled very early in the Austronesian spread into Micronesia.

Kiribati has two main dialects. One is associated with islands in the north of the group, and the other with those in the south. No standard variety has been adopted, but in practice the southern dialect is emerging as a standard. An additional dialect is spoken on Makin and Butaritari, and another on Nui (in Tuvalu). The entire speech community of a third dialect, Banaban, was relocated from Banaba (Ocean Island) to Rabi Island in Fiji in the 1950s. Smaller relocated iKiribati communities are found in Nauru, the Solomon Islands, Vanuatu, and elsewhere in Fiji.

The Kiribati language retains a central role in modern Kiribati. It predominates in newspapers, on the radio, and in the churches. The language also has official recognition, but takes second place to English. The national language is Kiribati, while English is the official language. The country's constitution, laws, and official government documents have both a Kiribati and an English text, but the English is

of the standard language. Northern dialects tend toward intervocalic voicening of **s** (e.g., **bala-zï** [child-POSS.3.SG] 'his/her child' instead of **bala-sï** [child-POSS.3.SG]), a feature typical of the South Siberian Turkic languages. The southern dialects, mainly those spoken in the Ferghana basin, show different degrees of Uzbek influence. They lack some characteristic features that separate Kirghiz from other Turkic languages. For example, the glide **w** is preserved in cases in which the standard language only exhibits a long vowel as a trace of a velar that once underwent labialization (e.g., **tow** 'mountain' instead of **to:**) The past copula particle **ede** 'was' is used instead of **ele**. The plural suffix is used in third-person plural forms of finite verb (e.g., **kel-di-ler** [come-PAST-PL.3] 'they came'), instead of **kel-iš-ti** [come-PL-PAST.3]. The 'pronominal **n**' has been lost under Southeastern Turkinc influence. There are also other changes in the nominal inflection. Words copied from Arabic and Persian via Chaghatay and Uzbek have preserved their original phonetic shape to a higher degree than in the northern dialects.

Kiribati: Language Situation

B Palmer, University of Surrey, Guildford, UK

The Republic of Kiribati is a chain of 33 atolls and tiny coral islands straddling the equator in Micronesia in the central-western Pacific north of Fiji. The total land area is about 811 square kilometers scattered across over 5 million square kilometers of ocean.

Kiribati was initially settled over 2000 years ago by Austronesian speakers. The Kiribati remained skilled ocean voyagers, and there is evidence of regular contact with other Pacific groups. However, Kiribati remained isolated from Western influence until the arrival of whalers and missionaries during the 19th century. Formally taken under British control as the Gilbert Islands in 1877, Kiribati became independent in 1979. About one-third of its population lives in the national capital, Bairiki, on Tarawa atoll.

The country is home to one indigenous language spoken by over 97% of its approximately 100 000 inhabitants. The Kiribati language, also known as Gilbertese, is a Nuclear Micronesian language within the Oceanic branch of Austronesian. It is closely related to Ponapean, Kosraean, and Marshallese. The linguistic origin of the Micronesian grouping is not certain, but it is likely to have been in the Solomon Islands or Vanuatu. Kiribati is the most conservative Nuclear Micronesian language, which suggests (along with geography) that it was settled very early in the Austronesian spread into Micronesia.

Kiribati has two main dialects. One is associated with islands in the north of the group, and the other with those in the south. No standard variety has been adopted, but in practice the southern dialect is emerging as a standard. An additional dialect is spoken on Makin and Butaritari, and another on Nui (in Tuvalu). The entire speech community of a third dialect, Banaban, was relocated from Banaba (Ocean Island) to Rabi Island in Fiji in the 1950s. Smaller relocated iKiribati communities are found in Nauru, the Solomon Islands, Vanuatu, and elsewhere in Fiji.

The Kiribati language retains a central role in modern Kiribati. It predominates in newspapers, on the radio, and in the churches. The language also has official recognition, but takes second place to English. The national language is Kiribati, while English is the official language. The country's constitution, laws, and official government documents have both a Kiribati and an English text, but the English is

defined as the authoritative version. Parliament may be conducted in Kiribati or English, although in practice Kiribati is normally used, mixed with specialist English terminology. Kiribati is used exclusively in education in the earliest years, giving way to English at the secondary level. A government Kiribati Language Board was established in the 1970s to standardize orthography and grammar, prepare a dictionary (yet to appear), and encourage Kiribati literature, although vernacular literature remains limited.

Klatt, Dennis H. (1938–1988)

K N Stevens

This article is reproduced from the previous edition, volume 4, p. 1852, © 1994, Elsevier Ltd.

Born on March 31, 1938, Dennis Klatt carried out his undergraduate and early graduate studies in electrical engineering at Purdue University. In 1964, he completed his doctorate in the communication sciences program at the University of Michigan, with a thesis entitled 'Theories of aural physiology.' He spent most of his professional career at the Massachusetts Institute of Technology, where he was for many years a senior research scientist in the Department of Electrical Engineering and Computer Science, and in the Research Laboratory of Electronics. His activities at MIT and his role as a consultant to industry consisted of a balanced combination of fundamental research into the mechanisms of human speech production and perception and applied research leading to practical devices. He died on December 30, 1988.

Klatt's fundamental contributions to an understanding of speech processes covered a broad range of topics. His detailed experimental studies of speech timing in English led to several papers on the rules governing control of the durations of the sounds, words, and phrases that make up spoken sentences. He had a continuing interest in the problem of how speech is processed in the auditory system and central nervous system of human listeners. This speech perception research ranged from detailed experimental studies of how listeners extract information from the rapidly changing events in speech to models of the storage and access of lexical information by listeners. In his publications, he argued convincingly that the development of appropriate distance metrics is a central problem in determining whether two utterances represent two tokens of the same word or represent two different words. His contributions to the advancement of automatic speech recognition included serving on the advisory committee of a national effort in this area in the 1970s and publication of a comprehensive review of the field as it existed at that time.

The area where Klatt's work had a major impact for those working in the field of speech communication is speech synthesis. He developed a flexible computer-based synthesizer that can be used to generate sounds in basic studies of human speech perception. The software for this synthesizer was made available to research laboratories that are active in these areas, making possible new quantitative research on the processes of auditory and speech perception. The versatility of the speech synthesis system lies in its ability to generate in a natural way a variety of utterances with different amounts of nasalization, with aspiration, with different glottal characteristics, and so on. With this synthesizer as a base, Klatt developed a complete system for synthesis of speech from English orthography. This system, implemented as DECtalk, was generally acknowledged to produce the most intelligible speech of any synthesizer available at the time. He carried out a detailed study of the characteristics of the voice source, particularly for female talkers, in an effort to improve further the naturalness of the synthesizer output.

Knorosow, Yuri (1922–1999)

O Molchanova, Uniwersytet Szczecinski, Szczecin, Poland

Yuri Knorosow, a Russian ethnographer of Central America and linguist, was born on November 19, 1922 in Kharkov (the Ukrainian republic), and died in 1990 in Moscow. He graduated from Moscow University in 1948 and obtained his Ph.D. in 1955. Knorosow's most substantial contribution to scholarship is the decipherment of Mayan hieroglyphic writings, and also ancient Indian inscriptions from Mohenjo-Daro (an archeological site in Pakistan, near the Indus River) and Harappa (the site of successive cities of the Indus Valley civilization in Pakistan). Research on these Indian inscriptions revealed their correlation in grammatical structure with the Dravidian family.

Mayan inscriptions date back to the 1st century A.D., and the Mayan writing system employs 300 signs. There are four Mayan codices left in the world, and linguists have worked out a grid of syllabic glyphs in Maya as well as a significant portion of the logograms. The Mayan people wrote both logographically and phonetically, and logograms will often have phonetic complements to facilitate their correct identification.

The first attempts to decipher Maya were in the middle of the 19th century. In the middle of the 1950–1960s, Knorosow contributed greatly by making use of positional statistics, which opened up the possibility of studying Maya diachronically.

Kobayashi, Hideo (1903–1978)

R Washio, University of Tsukuba, Ibaraki, Japan

Japanese linguist Hideo Kobayashi, best known as the translator of *Cours de linguistique générale*, was born in Tokyo on January 5, 1903. He graduated from Tokyo Imperial University in 1927 with the thesis *Le langage de Henrik Ibsen: Essai stylistique*. When he did the translation of the *Cours*, he was only 24 years old and was already described as a rising scholar and a natural-born linguist who had mastered more than 10 modern European languages, "not to speak of Classical Greek, Latin and Sanskrit" (Kindaichi, 1928: 521).

In 1929, Kobayashi was appointed to the Faculty of Law and Literature at Keijo Imperial University, which was established in Seoul, Korea by Imperial Japan in 1924. With the end of World War II, he returned to Japan. In 1949, he was appointed Professor at Tokyo Institute of Technology. After he retired from Tokyo Tech in 1961, he served as Professor at Waseda University until his retirement in 1973.

Kobayashi's *Gengogaku genron* (Fundamentals of Linguistics) was the first translation of the *Cours*, published three years before the German translation appeared in 1931. Its title was changed to *Ippan gengogaku kōgi* (Course in General Linguistics) when it underwent the last major revision in 1972—five years before Kobayashi died. His translation, which may still be the only translation of the *Cours* in a non-Indo-European language, made the *Cours* accessible to all those capable of reading Japanese, including a large number of Korean scholars and students. The words Kobayashi coined for notions such as *synchronie* and *diachronie* have become firmly established in both Japan and Korea.

Saussure's influence in Japan has been described as "immense" (*Édition critique*, p. 369). De Mauro suggested that a factor contributing to it might have been the prior influence in Japan of E. D. Polivanov and H. E. Palmer. It was unquestionably Kobayashi, however, who had played a decisive role in the spread and penetration of the Saussurean thoughts in Japan. As early as the 1930s, more than 20 years prior to the publication of the English translation of the *Cours*, Saussure's theory of language had been met in Japan with a harsh criticism from Motoki Tokieda, a scholar in the traditional school of Japanese linguistics. Like many of his contemporaries, Tokieda had learned about Saussure's theory through Kobayashi's translation of the *Cours*, and even more importantly, by Kobayashi's own writings on linguistics, some of which had served as a kind of companion to (the Japanese version of) the *Cours* in the early days of modern linguistics in Japan. In addition to the *Cours*, Kobayashi had also translated such works as Louis Hjelmslev's *Principes de grammaire générale* and Charles Bally's *Linguistique générale et linguistique française*.

Kodzu, Harushige (1908–1973)

T Maruyama, Nanzan University, Nagoya, Japan

Harushige Kodzu was a pioneer scholar of Indo-European comparative linguistics and ancient Greek, especially its Arcadian dialect, in 20th century Japan.

Having graduated from the University of Tokyo in 1930, Kodzu left Japan for the United Kingdom to study comparative grammar from 1931 to 1934 at Oxford University under the guidance of various professors, including Frederick W. Thomas and E. Braunholtz. Upon returning to Japan, he continued his research in the graduate school of the University of Tokyo. In 1936 he married Kumiko Honma and had a daughter. The contributions of his wife and his daughter as philological assistants to his research were considerable. In 1938 he was appointed research assistant of the department of linguistics at the University of Tokyo, and lecturer in 1942. He was granted his D.Litt. in 1946 from the same university. Two years later, he was appointed associate professor of linguistics, and he was promoted to full professor in 1951. In March 1968, he retired from the university with the title of Emeritus Professor. In the following year, he was invited to become the Dean of the Faculty of Letters of Musashi University. He continued his work until his death in 1973. His major publications are listed in *Gengo Kenkyu* (the Journal of the Linguistic Society of Japan) No. 64, published in 1973, with an obituary written by his disciple Kiyozo Kazama.

In his doctoral dissertation of the ancient Greek Arcadian dialect (1946), he meticulously studied carved inscriptions and linguistic boundaries with other dialects. He carried out extensive and thorough investigations of stone inscriptions within the linguistic

In 1929, Kobayashi was appointed to the Faculty of Law and Literature at Keijo Imperial University, which was established in Seoul, Korea by Imperial Japan in 1924. With the end of World War II, he returned to Japan. In 1949, he was appointed Professor at Tokyo Institute of Technology. After he retired from Tokyo Tech in 1961, he served as Professor at Waseda University until his retirement in 1973.

Kodzu, Harushige (1908–1973)

T Maruyama, Nanzan University, Nagoya, Japan

Harushige Kodzu was a pioneer scholar of Indo-European comparative linguistics and ancient Greek, especially its Arcadian dialect, in 20th century Japan.

Having graduated from the University of Tokyo in 1930, Kodzu left Japan for the United Kingdom to study comparative grammar from 1931 to 1934 at Oxford University under the guidance of various professors, including Frederick W. Thomas and E. Braunholtz. Upon returning to Japan, he continued his research in the graduate school of the University of Tokyo. In 1936 he married Kumiko Honma and had a daughter. The contributions of his wife and his daughter as philological assistants to his research were considerable. In 1938 he was appointed research assistant of the department of linguistics at the University of Tokyo, and lecturer in 1942. He was granted his D.Litt. in 1946 from the same university. Two years later, he was appointed associate professor of linguistics, and he was promoted to full professor in 1951. In March 1968, he retired from the university with the title of Emeritus Professor. In the following year, he was invited to become the Dean of the Faculty of Letters of Musashi University. He continued his work until his death in 1973. His major publications are listed in *Gengo Kenkyu* (the Journal of the Linguistic Society of Japan) No. 64, published in 1973, with an obituary written by his disciple Kiyozo Kazama.

In his doctoral dissertation of the ancient Greek Arcadian dialect (1946), he meticulously studied carved inscriptions and linguistic boundaries with other dialects. He carried out extensive and thorough investigations of stone inscriptions within the linguistic

island of the Arcadian dialect, and based on his extremely detailed research concerning the boundaries with other dialects, he came to entertain misgivings about the then generally accepted theory of P. Kretchmer that the Ionians were the oldest Greek ancestors. He arrived at the conclusion that the Ionians evolved from the mixture of several races of Asia Minor.

Kodzu's attitude toward his research was extremely catholic, in that he did not confine himself only to the dimension of language; rather, his vision embraced all aspects of the classical world, which he sought to understand as a whole. In his approach to the reconstruction of prehistoric Greek languages, he took into account various legends, archeological discoveries, as well as place names, to obtain a truly comprehensive understanding.

Kodzu was a leading committee member of the Linguistic Society of Japan ever since its foundation in 1938. His contribution to classical philology in Japan is also remarkable. He worked for *Seiyo Koten Kenkyu* (Journal of Classical Studies) as one of the editors from its foundation in 1953 until his death. By translating a number of Greek classical literary works into Japanese and publishing more than 20 books concerning Indo-European linguistics or the Greek language, he planted the genuine tradition of western classical philology in Japan.

Koelle, Sigismund Wilhelm (1823–1902)

S Pugach, Ohio State University, Lima, OH, USA

Sigismund Wilhelm Koelle was born in Kleebronn, Württemberg, on July 14, 1823, and died on February 2, 1902, in London. Koelle was one of a handful of German missionaries from Württemburg, including J. L. Krapf and J. F. Schön, who fundamentally shaped the nascent discipline of African linguistics in the mid-19th century (*see* **Krapf, Johann Ludwig (1810–1881)**). From 1841 to 1845, Koelle studied to become a missionary in Basel, then joined the London-based Church Missionary Society. In 1847, after briefly studying Arabic in Tübingen, Koelle was sent to Freetown, Sierra Leone. While there, Koelle was employed as a linguist at the Fourah Bay Institute. The Institute, later renamed Fourah Bay College, University College of Sierra Leone, was the first place in Africa where African language research was conducted.

It was in Sierra Leone that Koelle undertook his most renowned enterprise, the *Polyglotta Africana*, a classification of over 100 West African languages, culled from a collection of about 200 (Dalby, 1970). Shortly after his arrival, Koelle began to collect data from ex-slaves, as P.E.H. Hair has noted (Hair, 1967). The terms West Atlantic, Mande, Mandingo, and Kru all derive from the *Polyglotta*; indeed, the genetic and typological classification of the Mande language family arose with Koelle's work (Wyrod, 2003). Koelle also identified nine 'South African' language groups that would today be classified as Bantu or semi-Bantu, and among which he recognized a distinct relationship (Dalby, 1970). The *Polyglotta* comprised approximately 300 words and phrases listed in the various languages – which included five dialects of Ibo, among others – and was the most complete comparative work on African languages at that time (Koelle, 1854b; Hair, 1967; Jungraithmayr and Leger, 1983). Hair has observed that Koelle's classification in the *Polyglotta* was very sophisticated, precisely locating most of the languages involved and accurately assessing their relationships to each other (Hair, 1967). The *Polyglotta* is also invaluable to historians, since many of Koelle's informants were ex-slaves and their

Koelle, Sigismund Wilhelm (1823–1902)

S Pugach, Ohio State University, Lima, OH, USA

Sigismund Wilhelm Koelle was born in Kleebronn, Württemberg, on July 14, 1823, and died on February 2, 1902, in London. Koelle was one of a handful of German missionaries from Württemburg, including J. L. Krapf and J. F. Schön, who fundamentally shaped the nascent discipline of African linguistics in the mid-19th century (*see* **Krapf, Johann Ludwig (1810–1881)**). From 1841 to 1845, Koelle studied to become a missionary in Basel, then joined the London-based Church Missionary Society. In 1847, after briefly studying Arabic in Tübingen, Koelle was sent to Freetown, Sierra Leone. While there, Koelle was employed as a linguist at the Fourah Bay Institute. The Institute, later renamed Fourah Bay College, University College of Sierra Leone, was the first place in Africa where African language research was conducted.

It was in Sierra Leone that Koelle undertook his most renowned enterprise, the *Polyglotta Africana*, a classification of over 100 West African languages, culled from a collection of about 200 (Dalby, 1970). Shortly after his arrival, Koelle began to collect data from ex-slaves, as P.E.H. Hair has noted (Hair, 1967). The terms West Atlantic, Mande, Mandingo, and Kru all derive from the *Polyglotta*; indeed, the genetic and typological classification of the Mande language family arose with Koelle's work (Wyrod, 2003). Koelle also identified nine 'South African' language groups that would today be classified as Bantu or semi-Bantu, and among which he recognized a distinct relationship (Dalby, 1970). The *Polyglotta* comprised approximately 300 words and phrases listed in the various languages – which included five dialects of Ibo, among others – and was the most complete comparative work on African languages at that time (Koelle, 1854b; Hair, 1967; Jungraithmayr and Leger, 1983). Hair has observed that Koelle's classification in the *Polyglotta* was very sophisticated, precisely locating most of the languages involved and accurately assessing their relationships to each other (Hair, 1967). The *Polyglotta* is also invaluable to historians, since many of Koelle's informants were ex-slaves and their

accounts provide information on which groups were caught up in the slave trade and over which routes slaves were taken (Curtin and Vansina, 1964).

Koelle's brief sub-Saharan African career was prolific. He was only in Sierra Leone for five years, yet in addition to the *Polyglotta* Koelle was able to write a grammar of the Vai language, in which he also described the indigenous Vai alphabet, as well as a grammar of Kanuri (Koelle, 1851, 1854a). Koelle met with Memelu Duwalu Bukele, leader of the Vai and innovator of the Vai script, prior to compiling his grammar. In the grammar, Koelle attempted to compare Vai word roots with the roots from various European languages in order to demonstrate an affinity among their sounds; he did so in part to dispel racist claims that Africans and Europeans did not belong to the same species (Koelle, 1851; Pugach, 2001). Moreover, according to Thomas Geider, Koelle's *African native literature*, a collection of oral folktales in Kanuri, is the first full anthology of African literature ever published (Koelle, 1854a; Geider, 1997). Geider also comments that the folktales Koelle collected were the first African texts that the brothers Grimm, Jacob and Wilhelm, used in their comparative folklore studies (Geider, 1997; Grimm and Grimm, 1856).

After leaving Africa, Koelle concluded all work on sub-Saharan African languages and turned his attention to North Africa and Asia. In 1855 the Church Missionary Society sent him to Damietta, a city in Egypt, and then to Palestine and Turkey. Koelle learned Turkish and conducted research on it, though it is unclear whether he ever published these labors, and he was certainly not as well known in the West Asian language field. Still, in 1856 Koelle received the Volney prize for his overall contributions to linguistics (Jungraithmayr and Leger, 1983).

Koerner, E. F. Konrad (b. 1939)

J E Joseph, University of Edinburgh, Edinburgh, UK

Ernst Frideryk Konrad Koerner was born in 1939 in Mlewiec near Torun (Thorn), Poland. He studied English and German philology, history of art, pedagogy, philosophy, and applied linguistics at the Universities of Göttingen, Berlin, and Edinburgh, completing a B.Phil. at the Free University of Berlin in 1965 and an M.A. at the Justus Liebig University of Giessen in 1968. From there he went to Simon Fraser University in Vancouver, where in 1971 he completed his Ph.D. thesis, 'Ferdinand de Saussure: Origin and development of his linguistic theory in western studies of language: A critical evaluation of the evolution of Saussurean principles and their relevance to contemporary linguistic theories,' a revised version of which was published in 1973.

The thesis posed a number of audacious challenges to the received history of modern linguistics. The 1960s had witnessed the putting forward by prominent scholars of a series of Saussurean 'precursors,' including the sociologist Durkheim and Gabelentz, a linguist whose work lay outside the Neogrammarian mainstream in which Saussure was trained. Koerner argued that more convincing sources could be found within that mainstream itself: rather than Gabelentz, he pointed to Paul, whose 1880 *Principien der Sprachgeschichte* was regarded by the Neogrammarians as their 'bible,' and Whitney, the American linguist whom they respected and Saussure whom they revered. In the case of Durkheim, Koerner raised strong objections to the fact that his name is never cited anywhere by Saussure, insisting that a methodology that ignores the documentary record can produce 'influences' without any limit or firm basis.

These assertions would persist as themes of Koerner's work in the decades that followed, as would a number of others: the impact on 19th-century linguistics of the natural sciences, the parallels among various 'revolutions' proclaimed in modern linguistics, from Jones's 'discovery' of Indo-European linguistic affinities in 1786 to Bopp's methodological refinements of 1816, the Neogrammarian revolution of 1876, structuralism in the 1920s, and the Chomskyan revolution of the 1960s. Koerner considers the last of these particularly dubious, in view of the demonstrable continuity between Chomsky's early methodology and that of his predecessors Jakobson, Hockett, and Harris.

After completing his doctorate, Koerner occupied posts as research associate at the Universities of Texas and Indiana, then in 1973 returned to Germany to do research and teach at the University of Regensburg. In 1976 he took up the professorship of linguistics at the University of Ottawa, which he held until his retirement in 1999, when his 60th birthday was marked by three *Festschrift* publications.

Koerner's importance within modern linguistics owes as much to his organizational energies and editorial skills as to his own scholarship. In 1973 he launched *Historiographia linguistica*, the first journal devoted to the history of linguistics, and the book series *Studies in the history of the language sciences*, both with John Benjamins of Amsterdam. In 1978, he organized the first International Conference on the History of the Language Sciences at the University of Ottawa; this has subsequently become a triennial event. Koerner also helped to establish a number of national societies in the field, including the Henry Sweet Society for the History of Linguistic Ideas in the UK and the North American Association for the History of the Language Sciences.

Koerner's other editorial enterprises would have wide-ranging positive repercussions for the development of linguistics in the last decades of the 20th century. His founding in 1984 of the journal *Diachronica* would help revitalize historical linguistics at a time when it appeared to be in a terminal decline, and the series *Current issues in linguistic theory*, which he started with Benjamins (whose move from antiquarian book dealer to publisher occurred at Koerner's prompting), offered a stable, high-quality publication outlet for nonmainstream approaches to the study of language at a point when English language academic presses had begun focusing narrowly on Chomskyan generativism. Linguistics would be much less diverse a field today had it not been for these undertakings.

Kono, Rokuro (1912–1998)

T Maruyama, Nanzan University, Nagoya, Japan

Rokuro Kono, a member of the Japan Academy, passed away in 1998 at the age of 85, leaving a legacy of various linguistic achievements. Born in Kobe in 1912, he graduated from the department of linguistics of the University of Tokyo in 1937 and started his academic career in Seoul. After returning to Japan, he spent most of his time at Tokyo University of Education, where he raised several promising academic successors. He assumed various important posts at the Toyo Bunko and Oriental Library and Research Institute for Languages and Cultures of Asia and Africa. He was also a director at the Center for East Asian Cultural Studies for Unesco from 1979 to 1981. He was commended officially as a person of cultural merits in 1993.

His academic achievements are mainly in the following three areas: the study of the Korean language, the study of Chinese historical phonology, and grammatology.

Kono studied the development of grammar and the accentual system from 15th- and 16th-century Korean to Modern Korean. He also made remarkable achievements in the comparative study of Egyptian hieroglyphs, cuneiform characters, and Chinese characters. His interpretation concerning *zhuanzhu* (*chuan-chu*), one type of the six different patterns of development of Chinese characters, is rated highly in the academic world. Although he was a renowned expert in Oriental languages, he also amassed considerable knowledge of classical Greek, Latin, Sanskrit, and Hebrew, not to mention modern languages such as English, German (German, Standard), French, Russian, and, of course contemporary and classical Chinese.

Kono also had a unique and significant approach to the typology of language. Although his ideas concerning typology of language have not been presented in a unified body of writings, they still have had a strong influence on later generations of linguists in Japan. The typological distinctions he raised between double-branch languages, those always requiring a grammatical subject in their sentence structure, like English, and single-branch languages, those not requiring a grammatical subject, like Japanese, are very thought provoking and may contribute much to the future typology of language. His theory was probably the first unique approach to typology born from Japanese cultural and linguistic soil.

Kono was one of the chief editors of *The Sanseido encyclopaedia of linguistics* (6 vols), published from 1988 to 1996 in Japan. It contains descriptions of more than 3500 different languages of the world and about 1500 important terminologies of linguistics.

Kordofanian Languages

T C Schadeberg

Kordofanian is the name of an African language family. It derives its name from that of a former Islamic state with El Obeid as its center.

All 20-odd Kordofanian languages are spoken in the Nuba Mountains in the Republic of the Sudan. The total number of speakers is estimated at around 200 000. Available information about Kordofanian languages is sketchy; no Kordofanian language has been well documented and analyzed. The unity of the Kordofanian language family was first postulated by J. H. Greenberg in 1950; later (in 1963), he classified

Kono, Rokuro (1912–1998)

T Maruyama, Nanzan University, Nagoya, Japan

Rokuro Kono, a member of the Japan Academy, passed away in 1998 at the age of 85, leaving a legacy of various linguistic achievements. Born in Kobe in 1912, he graduated from the department of linguistics of the University of Tokyo in 1937 and started his academic career in Seoul. After returning to Japan, he spent most of his time at Tokyo University of Education, where he raised several promising academic successors. He assumed various important posts at the Toyo Bunko and Oriental Library and Research Institute for Languages and Cultures of Asia and Africa. He was also a director at the Center for East Asian Cultural Studies for Unesco from 1979 to 1981. He was commended officially as a person of cultural merits in 1993.

His academic achievements are mainly in the following three areas: the study of the Korean language, the study of Chinese historical phonology, and grammatology.

Kono studied the development of grammar and the accentual system from 15th- and 16th-century Korean to Modern Korean. He also made remarkable achievements in the comparative study of Egyptian hieroglyphs, cuneiform characters, and Chinese characters. His interpretation concerning *zhuanzhu* (*chuan-chu*), one type of the six different patterns of development of Chinese characters, is rated highly in the academic world. Although he was a renowned expert in Oriental languages, he also amassed considerable knowledge of classical Greek, Latin, Sanskrit, and Hebrew, not to mention modern languages such as English, German (German, Standard), French, Russian, and, of course contemporary and classical Chinese.

Kono also had a unique and significant approach to the typology of language. Although his ideas concerning typology of language have not been presented in a unified body of writings, they still have had a strong influence on later generations of linguists in Japan. The typological distinctions he raised between double-branch languages, those always requiring a grammatical subject in their sentence structure, like English, and single-branch languages, those not requiring a grammatical subject, like Japanese, are very thought provoking and may contribute much to the future typology of language. His theory was probably the first unique approach to typology born from Japanese cultural and linguistic soil.

Kono was one of the chief editors of *The Sanseido encyclopaedia of linguistics* (6 vols), published from 1988 to 1996 in Japan. It contains descriptions of more than 3500 different languages of the world and about 1500 important terminologies of linguistics.

Kordofanian Languages

T C Schadeberg

Kordofanian is the name of an African language family. It derives its name from that of a former Islamic state with El Obeid as its center.

All 20-odd Kordofanian languages are spoken in the Nuba Mountains in the Republic of the Sudan. The total number of speakers is estimated at around 200 000. Available information about Kordofanian languages is sketchy; no Kordofanian language has been well documented and analyzed. The unity of the Kordofanian language family was first postulated by J. H. Greenberg in 1950; later (in 1963), he classified

Kordofanian as a primary branch of his Niger–Congo family.

There are four branches of Kordofanian, named after centrally located towns (names of individual languages are given in parentheses): Heiban (Moro, Tiro, Shirumba, Utoro, Ebang, Laru, Logol, Rere, Warnang, Ko), Talodi (Ngile, Dengebu, Tocho, Jomang, Nding, Tegem), Rashad (Tagoy and Tegali dialect clusters), and Katla (Kalak, Lomorik). Data from wordlists and short grammatical descriptions make it clear that at least the first three branches of Kordofanian have a noun class system (marked by prefixes), which may be taken as evidence for genetic relationship (i.e., common origin) with the large Niger–Congo language family. Lexical evidence for this relationship remained very limited in the early 1990s.

The nine languages of the Kadugli group (Yega, Mudo, Talla, Miri, Tolubi, Kufo, Sangali, Krongo, Talassa) are spoken by about 100 000 people living on the hills lining the southern edge of the Nuba Mountains. One of these languages has been described in a monograph (Reh, 1985). Greenberg originally classified the Kadugli languages as being part of Kordofanian, but this view has since been challenged. The Kadugli languages have systems of nominal classification that distinguish three or four genders, but any existing typological or substantial similarities with Niger–Congo are not sufficient to claim genetic relationship. It seems most likely that Kadugli belongs to the Nilo–Saharan language family – just as do all the other languages that surround Kordofanian.

Korea, Democratic People's Republic of: Language Situation

R King, University of British Columbia, Vancouver, BC, Canada

The national language of the Democratic People's Republic of Korea is Korean, spoken by approximately 23 million people. North Korea is highly homogeneous: it has no significant ethnic or linguistic minorities, and no official language besides Korean.

The standard language of North Korea, called Munhwaŏ, or 'the Cultured Language,' in order to distinguish it from the standard in South Korea. It claims to be based on the speech of the capital, P'yŏngyang, and to be "a composite of superior linguistic elements of our national language as created and cultivated by the joint efforts of all the people in the northern half of the republic, and has also developed by absorbing those fine elements of the national language as used traditionally everywhere in the south, including Seoul." The six major regional dialects of Korean are all mutually intelligible, with perhaps the exception of the Cheju Island dialect, which is now moribund, but which survives in diasporic enclaves in Japan. The most important foreign language in North Korean education appears to be English, followed by Chinese.

The literacy rate in North Korea is high, usually estimated at 93% or more. Unlike South Korea, in 1949 North Korea abolished the use of Chinese characters in the public media and, also unlike its neighbor, North Korea appears to have taught Chinese characters consistently (and in greater numbers) in the schools since at least the 1950s. Another contrast with South Korea is North Korea's ambitious, elaborate, consistent, and longstanding official attention to issues of language, such as questions of language policy, language planning, and neologisms.

There is growing concern in both North and South Korea about linguistic divergence between the official languages of the north and the south, but in official North Korean publications this is expressed through ridicule and disdain for the pollution of Korean in the south by English (and, to a lesser extent, Japanese).

Korea, Republic of (South): Language Situation

R King, University of British Columbia, Vancouver, BC, Canada

The national language of the Republic of Korea is Korean, spoken by approximately 48 million people. South Korea, like North Korea, is highly homogeneous, but in the last decade some heterogeneity has been introduced in the form of foreign guest workers, mostly from South- and Southeast Asia. There is also a growing number of foreign English language instructors, primarily from Canada, the United States, and Australia. Nonetheless, South Korea has no significant ethnic or linguistic minorities, nor any official language besides Korean. However, there have been controversial calls in recent years to make English a second official language.

The standard language of South Korea claims to be based on the speech of educated persons from the capital, Seoul. The six major regional dialects of Korean are all mutually intelligible, with perhaps the exception of the Cheju Island dialect, which is now moribund, but which also survives in diasporic enclaves in Japan. Unequivocally, the most important foreign language in South Korean education is English. However, the number of South Koreans studying Chinese and Japanese has soared in the past decade, while French and German have declined significantly in popularity. The literacy rate in South Korea is high, usually estimated at 93 percent or more.

Diglossia is not a feature of the South Korean language situation, but most South Koreans still learn approximately 1800 Chinese characters by the time they leave high school. These characters are often mixed in writing with the indigenous Korean script, *Han'gŭl*, in newspapers, journals, and academic writing. The question of whether to abolish the teaching and writing of Chinese characters has been an issue of debate in the South Korean educational and academic establishment for over fifty years, and it continues to be controversial.

Debates on language standardization and policy in South Korea have tended to be the business of rival academic cliques. Government policy (on, for example, orthography and romanization) as implemented by the ministries of education and culture has been inconsistent and, at times, controversial. The founding in 1991 of the National Academy of the Korean Language under the auspices of the Ministry of Culture and Sports, has already done much to rationalize South Korean language policy. At the time of writing, the National Academy of Korean Language is moving cautiously toward joint research projects with its counterpart in North Korea.

There is growing concern in both North and South Korea about linguistic divergence between the official languages of the north and the south. In South Korea this concern is accompanied by acute anxiety over the future viability of Korean under conditions of globalization that favor massive importation of English loanwords and grammatical patterns. Also noteworthy in the sociolinguistic situation in South Korea is internet language: that nation has one of the highest internet connectivity rates in the world, and computer-mediated communication is already having a visible effect on South Korean sociolinguistic life.

Korean

J H Grayson, University of Sheffield, Sheffield, UK

Phonology

Basic Structures

The Korean language is a nontonal, polysyllabic, agglutinative language belonging to the Altaic family and probably closely related to the Manchu and Tungus members of that language family. The only major modern language to which Korean would appear to be related is Japanese, but the two languages, although similar in most respects grammatically, are significantly different phonologically. Korean and Japanese are therefore linguistic isolates due to the lack of sources to demonstrate the precise linguistic connections between them and with other members of the Altaic family.

Unlike Chinese, Korean lacks true tonal sounds, although it does have vowel stress. The morphological structures of Korean are extremely complex. Korean vocabulary items are built up of multiple morphemes into a highly polysyllabic composition. Like all members of the Altaic family of languages, Korean uses certain morphemes as functional markers to indicate the role of a word within the sentence, as well as mood, tense, location, and the social relationship between the speaker, listener, and the person spoken about.

Triple Consonantal Structure

The consonants of the Korean language are unusual for the triple distinction that is made between soft consonants (lenis consonants), hard, unaspirated consonants, and hard, aspirated consonants. The consonants of the lenis series are *k, n, t, l, m, p, s,* and *ch.* The hard, unaspirated consonants are *kk, tt, pp, ss,* and *tch.* The hard, aspirated consonants are *k', t', p', ch',* and *h*. (These transcriptions follow the orthographic conventions of the McCune-Reischauer System of Romanization, the standard system of scholarly transcription.) The sound of *l* becomes a strongly flapped *r* when placed in an intervowel context. Usually consonants of any of the three series of consonants are pronounced as voiceless, with the exception that the soft consonants *k, t, p,* and *ch* are pronounced *g, d, b,* and *j* when they occur between voiced sounds.

Consonantal Position

A principal phonological feature of Korean is the extreme restriction of consonant position within a given morpheme. Certain sound sequences within a morpheme are not permitted, such as *s* combined with *k*, although the reverse may occur when *k* is final in the preceding morpheme and *s* begins the succeeding morpheme. Certain consonants when in the final position in the morpheme become a strongly dentalized sound. Thus, *t, tt* fortis, unaspirated *t*, *t'* (fortis, aspired *t), s, ch,* and *ch,* and *ch'* (fortis aspirated *ch*) all are pronounced as if they were *t* when they occur in the final position.

Intermorphemic Sound Change

Sound change between syllables is an important feature of the pronunciation of Korean morphemes. This feature, also true of Japanese, is made more difficult for the reader of Korean because it is an orthographic convention that the shape of the individual syllable (morpheme) should be preserved. Although the Korean alphabet itself is highly phonetic, the orthographic convention to preserve the written appearance of the syllable means that the reader must learn a large number of standardized sound changes that occur in the intersyllable position.

Intermorphemic Sound Movement

Sound movement between syllables also occurs. When a syllable that ends in a consonant is followed by a syllable beginning with a vowel, the final consonantal sound passes over to the next syllable. This passage of sound is not represented orthographically.

Nonclustering of Initial Consonants

Clusters of consonants at the beginning of a syllable are not characteristic, there being no equivalents of English *sk, st, str, sh,* and so on.

Triple Vowel System

The vowel system of Korean is as complex as the system of consonants. There are three ranges of vowels: standard vowels (monophthongs), vowel sounds beginning with *y* (rising diphthongs), and a wide range of full diphthongs and diphthongs beginning with the sound *w.* The basic vowels of the monophthong series are pronounced similarly to the vowels of the Romance languages. The monophthongs are *a*, *ŏ, o, u*, and *ŭ*. The *y* series of rising diphthongs are *ya*, *yŏ*, *yo, yu*. The principal diphthongs number 11, although other combinations are possible. Vowels are characterized by phonemic length, which refers to an alteration in tonal height. There is evidence of an earlier stage of vowel harmony that exists as a residual characteristic in certain linguistic contexts.

Grammar and Syntax

General Features

Korean is an agglutinative language with strong elements of fusion and analytical development. The morphological development of word derivation is a well-developed feature of the grammar of the language. Nouns possess a wealth of case forms, possess the grammatical category of specification, and do not possess grammatical gender. There are forms of demonstrative pronouns that indicate varying degrees of spatial relationship.

Number

There are two types of numeral systems: the indigenous Korean system, and the Sino-Korean system that was borrowed as an entire loanword system. Along with the numeral system, there is a system of classifiers that are bound morphemes used as counting words to refer to objects, animals, or people.

Syntactical Markers

The predicatives, verbs, and adjectives of Korean do not have person, number, or gender. They do possess markers indicating social status, tense, and a sentence conclusion. There are three major bands of social status or reference that can be indicated with the special markers, each band containing within it possibilities for further refinements to indicate the precise degree of social relationship existing between the speaker, the listener, or the person spoken about. Tense markers indicate three broad classes of time: the present, the past, and the future (more properly, supposition about the occurrence of an event). Sentence conclusion markers indicate a wide range of moods and meaning, including simple declaration, interrogation, request, demand, suggestion, and reflection. In addition, there are quotative constructions that may be added to the verb to indicate the quotation of a declaration, interrogation, demand, or request. The structure of the verb is verb stem + honorific infix + tense infix + sentence conclusion marker (vs + hi + ti + scm). There is a separate lexical form of the verb that is used to place the verb in alphabetical order in dictionaries, lexicons, and word lists.

Word Order and Word Relation

Word order in sentences for both independent and dependent clauses is always in the sequence of subject, object, predicate. Modifiers, whether of the adjectival or adverbial type, are always in the preposition modifying the word to which they refer. Syntactic relations between words may be expressed by postpositional markers, particles, syntactic nouns, adverbial particles, participles, and the infinitive form of predicatives. Thus, a sentence may consist of a series of clauses, such as an extended adjectival clause modifying a noun, which contains its own subject, object, and predicative with tense and honorific markers attached.

Speech Levels and Honorifics

As a key characteristic of the use of the Korean language is an appropriate use of the system of honorifics that show deference, a sentence must take into consideration three dimensions of speech relationship: (a) the nature of the relationship between the speaker and the listener, (b) the nature of the relationship between the speaker and the person spoken about, and (c) the appropriate way to speak of or about oneself. Any complete sentence will take into account at least one of these dimensions in addition to considerations of tense and mood.

Pronouns, especially for the second person, are very seldom used, the subject of the sentence being understood from the linguistic context.

Sentence Linkage

In sentences containing two independent clauses, the two clauses are linked together through a connection marker attached to the predicative of the first clause. The predicate of the final independent clause will contain markers for honorifics, tense, mood, and sentence conclusion. Where the initial clause is dependent, the connection marker attached to the predicative will indicate the precise relationship of the dependent clause to the independent and principal clause.

Vocabulary

Lexicon

Korean vocabulary is of three types: indigenous Korean vocabulary, Sinitic vocabulary, and loanwords from European languages. Indigenous Korean vocabulary is highly polysyllabic in structure, a feature that is put to good use in sound imitation. Of the world's languages, Korean is one of the most highly onomatopoetic languages. Sinitic vocabulary consists of three subtypes: (a) uniquely Korean terms created by using Chinese characters, (b) direct loanwords from Chinese, and (c) Sino-Japanese loanwords. Sinitic vocabulary consists of terms that are in both ordinary and learned usage, and constitutes more than half of the entire Korean lexicon. European

languages, particularly English, have contributed a number of words, both to the speech of the ordinary person and to the technical speech of professional persons. French, German, Spanish, and Portuguese have also made small contributions to the vocabulary of Korean. There are, or were, a small number of pure Japanese loanwords, but most of these have fallen into disuse through a movement for the purification of the language.

Word Creation

It is still common to use Chinese characters to create new items of technical vocabulary, for example, *nokhwa-gi,* for 'videotape recorder.' Most Sinitic items of vocabulary enter the language as nouns. By attaching the verb *hada* 'to do' in the postposition of the noun, loanwords of this type may be transformed into verbs. By using one of several constructions, such verbs may then be made into adjective or adverbial constructions. By adding *ki* (carrying a sense of continuous action) or *um/m* (carrying an abstract sense) to a verb stem, a verb may be nominalized. Dictionary definitions are often given using *um/m* attached to the final verb.

Parallel Vocabulary Sets

Throughout the vocabulary of Korean, there exists a parallel set of Korean and Sino-Korean vocabulary. Mention was made earlier of the existence of two systems of counting. This feature carries throughout the entire Korean lexicon. Often, but not exclusively, Sino-Korean words are used to name objects or subjects of discourse, while Korean words have a descriptive function. On some occasions, there is no preference in the use of one or the other type of vocabulary; in other instances, it is a matter of honorific or nonhonorific usage. With regard to time, hours are given in Korean numbers, while minutes are given in Sino-Korean numbers. Again, duration of time (i.e., 'it took 1 hour to go home') is given using Korean numerals.

Notwithstanding the enormous impact that Sinitic vocabulary has had on enriching the vocabulary of the Korean language, there has been virtually no influence on the grammar of Korean, possibly because Chinese and Korean derive from two radically different language families.

The Written Language

Modern Korean may be written in one of two forms, either by using only the Korean alphabet (known as *Han'gul* in the Republic of Korea) or a mixed script of *Han'gul* and Chinese characters. In North Korea, the Korean alphabet is used exclusively. In South Korea, usage varies from context to context. A personal letter may use only the indigenous alphabet, while newspapers, textbooks, and better-quality popular books will use a large number of Chinese characters in the text. The more sophisticated and formal a piece of writing is, the more Chinese characters will be used. The Ministry of Education requires a high school graduate to have mastered between 1700 and 1800 characters, the number of characters expected to be encountered in a daily newspaper.

Korean Lexicography

J Eu, Otago University, New Zealand

The Early Period

The unique Korean alphabet was invented in 1443. It is similar to the Roman alphabet in that it is phonetic, combining vowels and consonants. However, a substantial portion of the Korean vocabulary is based on Chinese characters. A Chinese-based Korean word has an ideographic Chinese character for each of its syllables. Thus, the Korean vocabulary is divided into Chinese-based words and native Korean words.

Shortly after the invention of the Korean alphabet, pronunciation guides that indicated the Korean sounds for Chinese characters appeared, in particular 訓蒙字會 (*Hunmongjahoe*) (1527), which was the first guide to provide both the meaning and sound of Chinese characters. The earliest known dictionaries as such, called 'word collections' (*eohuijip*), date from the late 17th century. Some of them were bilingual or multilingual, while others were mixtures of bilingual and monolingual elements. The bilingual dictionaries invariably had Chinese headwords and gave one simple Korean equivalent for each headword. The multilingual dictionaries simply added Japanese, Mongolian (Halh Mongolian), or Manchurian equivalents to those Chinese-Korean sets.

The mixed works had Chinese characters and words as the headwords, with a Korean equivalent for each headword. But in this case, this entry structure merely followed the tradition of Chinese priority, and in actuality the Chinese headwords served more like a meaning indicator for the Korean words offered as their equivalents, which were the real focus of these works. They can be considered bilingual because they use Chinese characters, and yet their monolingual character lies in the fact that a large portion of the Chinese words used are Chinese-based Korean words.

These word collections are organized according to meaning, or sometimes by the number of the brushstroke of the Chinese headwords, rather than in alphabetical order. They are called 'translation equivalents dictionaries' (*daeyeok sajeon*), because they provide a simple equivalent rather than a definition or linguistic information. Such dictionaries reflected the Chinese-centeredness of the Korean linguistic community of the time.

Modern Monolingual Dictionaries

The first published monolingual Korean dictionary in the modern sense is Moon Se Young's *Korean dictionary* (*Chosuneo sajeon*) (1938). This was the first dictionary to arrange Korean headwords alphabetically and to give definitions as well as linguistic information. Following this, several other Korean dictionaries were compiled, with increased size, many theoretical and methodological innovations, and specialized purposes.

The most notable recent developments are the publication of the *Yonsei Korean dictionary (YKD)* (1998) by Yonsei University and the *Standard Korean dictionary (SKD)* (1999) by the National Institute of the Korean Language. The YKD is the first corpus-based dictionary of Korean, with 50 000 headwords selected according to corpus frequency. Its focus is on current usage. In contrast, the SKD is the largest Korean dictionary ever produced, with 500 000 headwords, combining the entries of previous dictionaries and including archaic words. The SKD presents citations from works of literature, news, magazines, etc., and provides etymology. Currently, there are lexicography centers at Yonsei University and Korea University, where active research is underway to promote further advances in Korean lexicography.

Modern Bilingual Dictionaries

Bilingual dictionaries with Korean or non-Chinese headwords, arranged in alphabetic order, began to appear in the late 19th century. The foreign languages included French, Russian, and English. These dictionaries were written mainly by Western missionaries to Korea. In 1920 the Japanese colonial government in Korea published a Korean-Japanese dictionary.

Since the liberation of Korea in 1945, the rising importance of English has made Korean-English and English-Korean dictionaries the most prominent bilingual dictionaries in Korea. The first K-E and E-K dictionaries written for Korean learners of English were the *New life English-Korean dictionary* (*Shinseng younghan sajeon*) (1946) and its companion volume, the *New life Korean-English dictionary* (*Shinseng hanyoung sajeon*) (1947) by Ryu Hyeong Gi. Since then, numerous other authors and publishers have entered the market. Currently there are five major dictionary publishers producing and updating the five largest K-E and E-K dictionaries in Korea.

In contrast to monolingual lexicography, however, bilingual lexicography has not yet received serious theoretical and methodological attention in Korea. Bilingual dictionaries are compiled by commercial publishing companies, and their weaknesses have been widely criticized. Recently, however, there have

been some systematic reflections about seeking a new direction in Korean bilingual lexicography (Cho, 2002; Eu, 2004; Lee, 2005).

Computational Lexicography in Korean

Most of the above-mentioned recent dictionaries are available on the Internet, and some are available on CD-ROM. Going beyond a simple replica of paper dictionaries, the government-led 21st-Century Sejong Project has been building (since 1998) a large Korean lexical database to comprehensively serve the needs of Korean language–related research and developments such as natural language processing, lexicography, linguistics, education, and artificial intelligence, especially emphasizing a closer cooperation between linguists and computer scientists.

Machine translation between Korean and Japanese – languages that are very similar – has reached a fairly successful standard. For example, Internet sites where Koreans and Japanese can chat by using machine translation are growing in popularity. On the other hand, machine translation between Korean and English is still at a rather rudimentary level. There are Internet sites that search Korean phrases and sentences for their English equivalents, but their usefulness and accuracy are still quite limited.

Kotarbiński, Tadeusz (1912–1998)

R A Rothstein, University of Massachusetts, Amherst, MA, USA

Tadeusz Marian Kotarbiński was born on March 31, 1886, in Warsaw and died there on October 3, 1981. He studied technical subjects and architecture in Cracow, Lwów (now Lviv, Ukraine) and Darmstadt before taking up philosophy and the classics at Jan Kazimierz University in Lwów, where he earned his doctorate in 1912. He taught Greek and Latin in a Warsaw high school until 1918, when he began teaching at Warsaw University. During the interwar period he was active as a teacher and scholar, and also took part in the public debates of the time, speaking out and writing, for example, against anti-Semitism and clericalism.

During the Nazi occupation of Poland Kotarbiński took part in clandestine teaching; after the war he helped to organize the university in Łódź. He served as its first rector from 1945 to 1949, simultaneously teaching and chairing the Philosophy Department at Warsaw University. He eventually returned to Warsaw, remaining there until his death.

Kotarbiński's main areas of interest were praxiology and ethics, but he also devoted attention to formal logic, logical semantics, and the history of logic. He was the author as well of three volumes of aphoristic poetry.

Kotarbiński called his philosophical approach 'reism' (or 'concretism') and viewed its principles as "declaring war against the hypostases of linguistic origin," the faulty assumption that, for example, properties like 'roundness' or 'blueness' exist because natural languages have words for them. He drew a distinction between genuine names and apparent names. The former are names of persons or things; they include singular, general, and empty names (e.g., *Kotarbiński, philosopher, unicorn*, respectively). The latter are names of properties, relations, events, or states (*truthfulness, equality, departure, health*, respectively). Singular names, which refer to individuals or things, can serve as grammatical subjects.

Korean Script: History and Description

C W Kim, University of Illinois, Urbana, IL, USA

History

Use of Chinese Characters in the Early Period

By the beginning of the Common Era, there were three nations in the Korean peninsula and southern Manchuria. Effective governance of the state required a writing system if only to transmit royal edicts to local administrators, yet Korea had no script of its own. Since Korea had been under the heavy cultural influence of China, it was natural that Korea borrowed Chinese writing (*hanmun* 漢文) and characters (*hancha* 漢字) and adapted them to write Korean. Three such adaptive systems are briefly described below.

Both *idu* (吏讀 clerk reading) and *hyangch'al* (鄕札), which apparently have been in use since the 6th century, are mixed transcription systems in which content words are written with Chinese characters for their meanings, while function words borrow pronunciation only. The former is called *hun* (訓 semantic) reading, and the latter, *ŭm* (音 phonetic) reading. For example, a Korean phrase *po-go* 'see-and' would be transcribed and read as follows:

Chinese writing:	見	古
Meaning in Chinese:	'see'	'old'
Pronunciation in Chinese:	[kjen]	[go]
Intended reading in Korean:	[po]	[go]
Intended meaning in Korean:	'see'	'and'

The major difference between *idu* and *hyangch'al* is that while the former maintains the Chinese word order, the word order in the latter is altered to conform more with the word order in Korean. This process was facilitated with the help of *kugyŏl* (口訣), signs of grammatical markers written between phrases in the text. These signs were highly simplified Chinese characters in *ŭm*-reading denoting affixes and grammatical markers, helping the reader in comprehending the text. For example, *go* (古), a verbal connective seen above, was simplified to 口, just the bottom part; the character for topic marker *ŭn* (隱) was simplified to 阝, the left radical of the letter; a conditional affix *myŏn* (面) was simplified to 丆, just the top part of the letter, while a copula marker *i* (是) was simplified to the last stroke at the bottom, 乀, etc. These letter-signs were necessarily small and simplified as they had to be inserted into a small space between phrases and lines. They helped the reader construct sentential structures of Korean from Chinese writing.

These conventions of rendering Korean in Chinese were quite ill-fit. A 15th-century scholar expressed the effort as trying to fit a square pole into a round hole. The mismatch would disappear with a stroke of genius.

Invention of a Native Script: *Hangul*

Authorship and Motivation In volume 102 of *Sejong sillok* (世宗實錄 Chronicles of King Sejong), it is matter-of-factly written that "In December of the 25th year [of his reign = 1443], His Majesty personally devised ("親制") twenty-eight letters of *ŏnmun* (諺文 vernacular script)." Thus is announced one of truly great inventions in the history of mankind. Three years later in October 1446, it was officially promulgated as *Hunmin chŏng'ŭm* (訓民正音 (The Correct Sounds for the Instruction of the People). The script is now generally known as *hangul* (*han'gŭl*), meaning 'Korean writing'.

Classical Chinese phonology, which Sejong studied and had his scholars consult, divided the syllable into initials and rhymes. Sejong realized, however, that syllable-initial consonants and syllable-final consonants had equal weight as phonological units and thus could be written with the same letters. This tripartite division of the syllable isolated the syllable-nuclei and required Sejong to devise separate vowel letters. A new alphabet was thus born. The King's 28 letters, of which 17 were consonants and 11 were vowels, are given below. Note that vowel letters include diphthongs beginning with a semi-vowel [j].

Consonant letters	Vowel letters
ㄱ [k, g]	ㅏ [a]
ㅋ [k^h]	ㅑ [ja]
ㄴ [n]	ㅓ [ə] (ŏ)
ㄷ [t, d]	ㅕ [jə] (yŏ)
ㅌ [t^h]	ㅗ [o]
ㄹ [ɾ, l]	ㅛ [jo]
ㅁ [m]	ㅜ [u]
ㅂ [p, b]	ㅠ [ju]
ㅍ [p^h]	ㅡ [ɨ] (ŭ)
ㅅ [s]	ㅣ [i]
ㅈ [tʃ, ʤ]	• [ɔ]
ㅊ [$tʃ^h$]	
ㅿ [z]	
ㅇ (zero-initial or [ɦ])	
ㆆ [ʔ]	
ㅎ [h]	
ㆁ [ŋ]	

Principles of Graphic Structure Aside from the fact that this is a truly phonemic alphabet, what is also remarkable is that Sejong devised letters in such a way

that the graphic shapes showed the internal relations among the letters. To cite a few obvious ones:

- The visual distinction between the consonantal and vocalic letters is apparent. Vowels contain long bars, vertical or horizontal, with short strokes (originally dots) stemming from them, while consonants have more complex geometric figures.
- Vowel shapes reflect vowel harmony, which was active in 15th-century Korean. Letters with side strokes (dots originally, e.g., ·ㅣ → ㅓ) upward or rightward are 'bright' (*yang* 陽) vowels, while those with downward or leftward side strokes are 'dark' (*yin* 陰) vowels.
- The 'stroke-adding' (*kahoek* 加 劃) principle is applied to derive occlusives and aspirates (*ch'oryŏ* 稍厲 a little harsh) from base consonants, as can be seen in the chart below. One can also tell at a glance that a consonant is a sibilant, as only sibilants have slanting strokes.

	Base shape	One stroke	Two strokes
Labials	ㅁ [m]	ㅂ [p]	ㅍ [pʰ]
Alveolars	ㄴ [n]	ㄷ [t]	ㅌ [tʰ]
Velars	ㆁ [ŋ]	ㄱ [k]	ㅋ [kʰ]
Sibilants	ㅅ [s]	ㅈ [tʃ]	ㅊ [tʃʰ]
Glottals	ㅇ [ɦ] or Ø	ㆆ [ʔ]	ㅎ [h]
	Continuants	Occlusives	Aspirates

Origin and Sources There are three theories on the possible origin of the letter shapes.

1. A leading theory is that the forms of five basic letters were modeled after their articulatory configurations. This theory derives from a description in *Hunmin chŏng'ŭm haerye* (訓民正音解例 (Explanations and Examples of the Correct Sounds for the Instruction of the People), published in 1446 but only discovered in 1940, where it is stated that these letters 'depict outlines' (상형 象形) of speech organs. The relation between the letter forms and articulatory shapes is clear from the illustrative diagrams in Figure 1.
2. A gaining theory is that the letter forms imitated the Mongolian 'Phags-pa script. It comes from a new interpretation of a much disputed phrase in *Haerye* saying that the letter forms 'imitated *kojŏn*' (방고전 倣古篆). *Kojŏn* was initially thought to refer to 'old seal' characters, one of the stylized forms of old Chinese writing. But Ledyard (1966, 1997) argued that the character 古 (*ko/go*) referred to 蒙古 (*mongo*) or Mongolia.

   When Mongols founded the Yuan dynasty in the 13th century, Emperor Khubilai Khan felt that the new empire needed a new unified script and had a learned monk named 'Phags-pa invent a new script, which is now known as the 'Phags-pa script. There are indeed some uncanny similarities between certain 'Phags-pa and *hangul* letters. For example, from 'Phags-pa letter ꡂ [g], one can derive *hangul* ㄱ by removing the dangling box, or from 'Phags-pa letter ꡙ [ℓ], one can derive *hangul* ㄹ by rotating the letter 90 degrees clockwise and by straightening the middle line. These and other similarities, while not systematic, are a little too striking to relegate them to a simple accident.
3. Yet another theory has it that the letter forms derived from *kugyŏl* signs. To the extent that *kugyŏl* signs evolved from Chinese characters, one can say that this is a theory of Chinese origin. The chief proponent of this theory is W. Kim (1996). Recall that *kugyŏl* as signs of grammatical particles inserted between phrasal structures in Chinese writing came to be highly simplified and stylized, for example, 又 for 奴 (*ro*, Instrumental), 口 for 古 (*go*, Connective), 丿 for 底 (*dyŏ*, Inchoative), 厶 for 矣 (*ŭi*, Genitive), etc. Kim argues that these simplified *kugyŏl* letters eventually evolved into *hangul* letters, much as Japanese *katakana* letters evolved from simplified Chinese characters, e.g., カ [ka] from 加, タ [ta] from 多, セ [se] from 世, リ [ri] from 利, etc.

There have also been suggestions that the Sanskrit (Devanagari) script or the Uighur script served as a model of *Hunmin chŏng'ŭm* letters. But since these scripts were not phonemic alphabets in the strict sense, as the vowel [a] was assumed for every consonant and other vowels were marked as diacritics, it is unlikely that Sejong received the main inspiration from these alpha-syllabaries.

It is also highly unlikely that any one theory is exclusively right. King Sejong and his court scholars were well versed in phonologies and writing systems of the neighboring languages and undoubtedly consulted them as references. Sejong's innovative genius

Figure 1 Letterforms of base *hangul* letters and their articulatory shapes.

is not that he created something out of nothing, but rather that he created something much better in graphic structures, simplicity, and elegance than any writing system known then or now.

Post-15th Century Changes

Hangul, born in a royal crib, nevertheless took a painful and long time to grow. Not unexpectedly, it met fierce opposition in a Sino-centric world. No lesser figure than a Vice Director of the Royal Academy (Ch'oe Manli) stated in a memorial that "disregarding Chinese in favor of a vernacular script would be identifying ourselves with the barbarians." Chinese writing continued to be used until the end of the 19th century in official papers and among literati. *Hangul* survived mainly in the hands of women and commoners.

Among the original letters, ㅿ [z] and ㆆ [ʔ] became disused and lost, the former because the sound itself was lost and the latter because it was ill-fated from the beginning as a prescriptive letter to record orthodox Chinese pronunciation. ㆁ [ŋ], occurring as syllable-final only, was replaced by ㅇ, a null syllable-initial. Geminate letters, ㄲ, ㄸ, ㅆ, ㅉ, which were initially used to record voiced Chinese sounds, were also disused, but were later revived to record tense consonants, replacing the old ways of writing them, i.e., ㅺ, ㅼ, ㅽ, ㅾ. This situation resulted in much confusion, and became the source of a heated debate among Korean scholars as to whether or not these letters actually represented consonant clusters, [sk, st, sp], etc.

Vowel shift triggered the loss of the vowel ㆍ [ɔ], and the eventual decay of vowel harmony. Former diphthongs came to represent newly emerged front vowels, e.g., ㅐ [aj → æ], ㅔ [əj → e].

What was primarily a phonemic orthography at the time of *hangul*'s invention has now become a morphophonemic orthography, following the proposal for Unified Orthography in 1933 by the Korean Language Society. Thus, 새미기픈므른 /sæ.mi.ki.p^{h}ɨn.mɨ.rɨn/, 'the water of a deep well', is now written 샘이 깊은 물은 /sæm.i kip^h.ɨn mul.ɨn/, preserving the morphemic identity (underlying form) of the lexical items and with word space. Today, *hangul* as the script of Korean is used by 70 million in both Koreas, with nearly 100% literacy thanks to *hangul*'s elegant simplicity.

Description

Inventory

King Sejong (r. 1418–1450) named his script *Hunmin chŏng'ŭm* 'Correct sounds for the instruction of people'. In the following centuries when Chinese still functioned as the official writing, it came to be known as *ŏnmun* 'a vulgar script'. Today it is generally known as *hangul* (*han'gŭl*), meaning 'a great writing' or possibly 'the Han (national) script', a coinage by the linguist Chu Sigyŏng (1886–1914). The script is called *urigŭl* 'our script' in North Korea (People's Democratic Republic of Korea).

Modern *hangul* is an alphabetic script consisting of 24 letters, 14 of which are letters for consonants and 10 are letters for vowels. Vowel letters include [j]-initial diphthongs, as can be seen in the following table. Voiced obstruents are intervocalic allophonic variants. ㄹ is [r] syllable-initially but [l] syllable-finally. ㅇ is silent syllable-initially, but is [ŋ] syllable-finally. Although the two had distinct letters, ㅇ and ㆁ, respectively, at the time the script was created, the two merged later, since [ŋ] never occurs syllable-initially in Korean. The order given below is that of dictionary entries in South Korea:

Consonant letters	Vowel letters
ㄱ [k, g]	ㅏ [a]
ㄴ [n]	ㅑ [ja]
ㄷ [t, d]	ㅓ [ə] (ŏ)
ㄹ [r, l]	ㅕ [jə] (yŏ)
ㅁ [m]	ㅗ [o]
ㅂ [p, b]	ㅛ [jo]
ㅅ [s]	ㅜ [u]
ㅇ (zero-initial or [ŋ])	ㅠ [ju]
ㅈ [tʃ, ʤ]	ㅡ [ɨ] (ŭ)
ㅊ [tʃ^h]	ㅣ [i]
ㅋ [k^h]	
ㅌ [t^h]	
ㅍ [p^h]	
ㅎ [h]	

Letters for obstruent consonants may be doubled to create geminates (or tense consonants), and some vowel letters combine to form new vowels including [w]-initial diphthongs, as shown below:

Geminates	Compound vowels
ㄲ [k']	ㅐ [æ] (from ㅏ + ㅣ)
ㄸ [t']	ㅒ [jæ]
ㅃ [p']	ㅔ [e] (from ㅓ + ㅣ)
ㅆ [s']	ㅖ [je]
ㅉ [tʃ']	ㅘ [wa]
	ㅚ [œ] (from ㅗ + ㅣ)
	ㅝ [wə] (wŏ)
	ㅟ [wi]
	ㅢ [ɨj] (ŭi)
	ㅙ [wæ]
	ㅞ [we]

Thus, the total number of letters including basic and complex letters is 30, 19 of which are consonant

letters and 21 are vowel letters. A large number of vowel letters stem from the fact that glides function as part of nuclei vowels in the syllable structure of Korean (Kim and Kim, 1991). There are also the following eleven syllable-final two-consonant clusters: ㄳ [ks], ㄵ [ntʃ], ㄶ [nh], ㄺ [lk], ㄻ [lm], ㄼ [lp], ㄽ [ls], ㄾ [lt^h], ㄿ [lp^h], ㅀ [lh], and ㅄ [ps]. No other possible combinations occur, e.g., ㄱㄹ, ㄴㄷ, ㄷㄹ, ㄹㄹ, ㅂㅍ, ㄹㄲ, ㅗㅓ, ㅜㅏ, ㅠㅏ, ㅛㅑ, ㅠㅕ, ㅠㅣ, ㅛㅣ, ᆖ, etc., although ㄹㄹ and ᆖ, have been proposed by some linguists as letters denoting lateral ㄹㄹ [ℓ] and ᆖ [jɨ], respectively, the latter glide-vowel being the pronunciation of [jə] in some dialects. No diacritic mark, even an apostrophe, is used.

General Characteristics of Script Shapes

Hangul script is quite unique in that its geometric shapes of basic letters are iconic symbols and that they reveal internal structural relations as described below.

1. Basic consonant letters depict their articulatory configurations (e.g., ㄱ depicts the tongue back raised against the velum, while ㄴ depicts the tongue tip making a contact with alveola (see Figure 1). Three basic vowel letters symbolize three elements, i.e., ㅣ 'a (standing) man', ㅡ 'the (flat) earth', and • (now extinct) 'the (round) heaven'.
2. Consonant and vowel shapes are distinguished from each other. The distinguishing stroke in vowels is a bar, either horizontal or vertical, by itself or with at most two short side strokes (originally dots) to the right or left of a vertical bar, or above or below a horizontal bar. Consonants have more complex geometric shapes with angled strokes.
3. In vowels, two short strokes tell that the letter represents a complex vowel [j] + V where V is the same vowel with only one side stroke, e.g., ㅑ [ja] = [j] + ㅏ [a], ㅠ [ju] = [j] + ㅜ [u], ㅒ [jæ] = [j] + ㅐ [æ], etc. [w]-glide is represented with either ㅗ [o] or ㅜ [u] before another vowel, e.g., ㅘ [wa] ([o] + [a]), ㅟ [wi] ([u] + [i]), etc.
4. In consonants, only sibilants have slanting strokes, i.e., ㅅ [s], ㅈ [tʃ], ㅊ [tʃ^h], while non-sibilants have right-angle strokes or circles, e.g., ㄱ [k], ㄷ [t], ㅂ [p], ㅁ [m], ㄹ [l], ㅇ [ŋ].
5. The so-called add-a-stroke principle yields derived sounds in a systematic way. For example, adding a stroke to a basic obstruent makes it an aspirated sound, e.g.:

   ㄱ [k] + stroke = ㅋ [k^h],
   ㄷ [t] + stroke = ㅌ [t^h],
   ㅈ [tʃ] + stroke = ㅊ [tʃ^h],

   In fact, the [j]-glide vowels ([3] above) may be regarded as having been derived from basic vowels via stroke adding.

These features are indeed quite unique and are probably not found in any other script in the world. In the Roman alphabet, for example, there is no internal relation between /p/ and /b/, /t/ and /d/, /k/ and /g/, etc. The subsegmetal features in the Korean script prompted Sampson (1985) and Kim (1988) to say that *hangul* is the only featural script in the world.

Writing Conventions

Unlike in Chinese writing where lines are vertical from right to left, contemporary Korean writing proceeds from left to right in horizontal lines as in English writing. In individual letter writing, *hangul* letters proceed from left to right and top to bottom. In addition, although *hangul* is a fully alphabetic script, it is written in syllable blocks such that one block consists minimally of an initial (onset) consonant and a nucleus vowel. It is because of this requirement that ㅇ is used as a filler letter when there is no initial consonant in the syllable. When the vowel letter is of a vertical bar, C and V are written side by side in this order, e.g., 가 /ka/ 'go'(Root). But if V consists of a horizontal bar, the V is written **below** the C, e.g., 구 /ku/ 'nine'. When there is a final (coda) consonant, this is written at the bottom of the block, regardless of whether the syllable has a vertical or a horizontal vowel, e.g., 간 /kan/ 'went', 국 /kuk/ 'soup', 한글 /han.kul/ '*hangul*', 닭 /talk/ 'chicken'.

Sizes of individual letters are slightly adjusted to fill the syllable block. Thus, ㄱ is elongated in 가 /ka/ but is flattened in 구 /ku/, and both consonants and vowels become slightly smaller when there is a coda, e.g., in 간 /kan/ or 국 /kuk/. This was a substantial problem in the age of typewriters, and some called for linearization or *karo-s'ŭgi* 'side-by-side writing', e.g., ㅎㅏㄴㄱㅡㄹ for 한글 /hankul/, but the advent of word processors quickly silenced the proponents.

Thus, *hangul* is an alphabetic script with subsegmental features but written in syllable blocks. This led Taylor (1979) to call *hangul* an alphabetic syllabary or an alpha-syllabary. This is another advantage of *hangul*. An alphabetic script makes it easier to learn, and a syllabic writing makes it easier to read. An experiment showed that a class of American college students first learning Korean read one and a half times faster in block writing than students in another class who were initially taught to write and read in linearized writing (Kim and Sohn, 1986).

Differences between North and South Korea

In North Korea, the same script is used, but is called *urigul* (*urigŭl*) 'our script', probably just to be different from its southern neighbor, just as the language is known by two different names, *p'yojunŏ* 'the standard language' in the south, but *munhwaŏ* 'the cultured language' in the north.

Both states have adopted the Unified Orthography proposed by the Korean Language Society in 1933, which is basically morphophonemic. Each state has since made minor modifications with varying details. In general the northern variety is more morphemic than the southern.

The order of the alphabet is slightly different in the two Koreas. First of all, in North Korea, ㅇ is the last consonant letter, not the 8th as in South Korea, probably because as the syllable-initial letter, it has a null phonetic value. In addition, characters consisting of two basic letters follow all single letters so that ㄲ, ㅼ, ㅽ, etc., follow ㅇ. But in South Korea, ㄲ immediately follows ㄱ, and ㅼ follows ㄷ, etc. Consonant clusters, however, are treated differently from geminates so that while the order of ㄱ, ㄲ and ㄳ as syllable-finals is as given in South Korea, it is ㄱ, ㄳ, . . . ㄲ in North Korea. That is, while ㄱ is immediately followed by ㄳ, the rest of the single letters intervene between ㄳ and ㄲ. The same principle applies in the order of vowel letters in the north, that is, double-letter characters such as ㅐ, ㅔ, ㅚ follow all single basic letters, and triple-letter characters ㅙ and ㅞ follow all double-letter vowel characters. In South Korea, however, complex letters immediately follow the basic letter from which they derive, e.g., ㅐ (ㅏ + ㅣ) comes after ㅏ but before ㅑ, and ㅘ, ㅙ and ㅚ immediately follow ㅗ, in this order.

Another difference between the two Koreas is the status of Sino-Korean vocabulary and characters (*hancha*). In the north it was determined early that a socialist state had no place for *hancha* because it is the property of the elite class, and the use of *hancha* was abolished altogether. This policy may have had a political motive of facilitating mass indoctrination. In the south, there has been a gradual decline in the use of *hancha*, even as purists and pragmatists heatedly debated the fate of *hancha*. Today about 1800 characters are taught in South Korea, 900 each in middle and high schools. *Hancha* is in fact now seeing a bit of a revival, due to the emergence of China as a powerhouse and due to a recognition that Chinese characters are becoming a lingua franca in East Asia.

been some systematic reflections about seeking a new direction in Korean bilingual lexicography (Cho, 2002; Eu, 2004; Lee, 2005).

Computational Lexicography in Korean

Most of the above-mentioned recent dictionaries are available on the Internet, and some are available on CD-ROM. Going beyond a simple replica of paper dictionaries, the government-led 21st-Century Sejong Project has been building (since 1998) a large Korean lexical database to comprehensively serve the needs of Korean language–related research and developments such as natural language processing, lexicography, linguistics, education, and artificial intelligence, especially emphasizing a closer cooperation between linguists and computer scientists.

Machine translation between Korean and Japanese – languages that are very similar – has reached a fairly successful standard. For example, Internet sites where Koreans and Japanese can chat by using machine translation are growing in popularity. On the other hand, machine translation between Korean and English is still at a rather rudimentary level. There are Internet sites that search Korean phrases and sentences for their English equivalents, but their usefulness and accuracy are still quite limited.

Kotarbiński, Tadeusz (1912–1998)

R A Rothstein, University of Massachusetts, Amherst, MA, USA

Tadeusz Marian Kotarbiński was born on March 31, 1886, in Warsaw and died there on October 3, 1981. He studied technical subjects and architecture in Cracow, Lwów (now Lviv, Ukraine) and Darmstadt before taking up philosophy and the classics at Jan Kazimierz University in Lwów, where he earned his doctorate in 1912. He taught Greek and Latin in a Warsaw high school until 1918, when he began teaching at Warsaw University. During the interwar period he was active as a teacher and scholar, and also took part in the public debates of the time, speaking out and writing, for example, against anti-Semitism and clericalism.

During the Nazi occupation of Poland Kotarbiński took part in clandestine teaching; after the war he helped to organize the university in Łódź. He served as its first rector from 1945 to 1949, simultaneously teaching and chairing the Philosophy Department at Warsaw University. He eventually returned to Warsaw, remaining there until his death.

Kotarbiński's main areas of interest were praxiology and ethics, but he also devoted attention to formal logic, logical semantics, and the history of logic. He was the author as well of three volumes of aphoristic poetry.

Kotarbiński called his philosophical approach 'reism' (or 'concretism') and viewed its principles as "declaring war against the hypostases of linguistic origin," the faulty assumption that, for example, properties like 'roundness' or 'blueness' exist because natural languages have words for them. He drew a distinction between genuine names and apparent names. The former are names of persons or things; they include singular, general, and empty names (e.g., *Kotarbiński, philosopher, unicorn*, respectively). The latter are names of properties, relations, events, or states (*truthfulness, equality, departure, health*, respectively). Singular names, which refer to individuals or things, can serve as grammatical subjects.

General names (of people or things) can serve as predicates, or as subjects in universal sentences. Empty names have no denotation, but can be replaced by synonymous combinations of singular and general terms. An apparent name, Kotarbiński argued, can only legitimately be used if the expression in which it occurs can be translated into an expression containing only genuine names. Thus we can get away with saying *John's anger was shortlived* because we can translate it into *John was not angry for long.* Saying the former no more commits us to the existence of 'anger' than saying *Mary took umbrage at my words* commits us to the existence of 'umbrage'; indeed, all that exist are objects (including people).

Kotarbiński was one of the first philosophers to consider the possibility of a three-valued logic (before Jan Łukasiewicz or Emil Post in the 1920s). He came to this position in 1912 from consideration of the possibility of creative activity. Assuming that truth is eternal, and that a statement S affirming the existence of an object O can be true if and only if O exists, it should be impossible to create O. For until O is created, S cannot be true, therefore – by one version of the law of the excluded middle – S must be (eternally) false and therefore O's existence cannot be affirmed. Kotarbiński rejected this version of the Aristotelian principle, suggesting instead that before O is created, S is neither true nor false, but indefinite.

Krapf, Johann Ludwig (1810–1881)

S Pugach, Ohio State University, Lima, Ohio

Johann Krapf was born on February 11, 1810, in Derendingen, Württemburg, and died on November 26, 1881, in Korntal, Württemburg. One of four children, he was the son of Johann Jakob Krapf, a farmer, and Katherina Maria Braun. He attended the Osterbergschule in Tübingen, where he discovered a talent for languages, studying Greek, Latin, French, Italian, and Hebrew (Pirouet, 1999). Krapf's next step was training to become a missionary at the Basel Missionary Institute, a training he interrupted to study theology at the University of Tübingen. In 1834 Krapf returned to the mission after a five-year hiatus, in which time he had been ordained and become a parish minister.

At this point the German Krapf joined the British Church Missionary Society, and in 1837 was sent to help found a mission station in Abyssinia. After unsuccessfully trying to establish the station and being driven from the region, Krapf moved to Shoa, in southern Ethiopia, before he was ultimately forced to go even further south, to Mombasa (Miehe, 1983). During his 19 years in Africa, Krapf achieved fame in two arenas: as a writer of historical travelogues, and as a linguist who compiled grammars and biblical translations for several languages. In this second capacity, Krapf belonged to a group of German missionaries, among them S. W. Koelle and J. F. Schön, who introduced the discipline of African linguistics to Europe (*see* **Koelle, Sigismund Wilhelm (1823–1902)**).

Once in Ethiopia, Krapf quickly immersed himself in language study, learning Oromo (Galla), Amharic, and Ge'ez [Geez]. He translated the Gospels of John and Matthew into Oromo, and wrote his first grammar and dictionary. In Shoa, Krapf became embroiled in a short controversy concerning whether to print Bibles in Amharic or Ge'ez; the British and Foreign Bible Society, which published Krapf's work, argued

General names (of people or things) can serve as predicates, or as subjects in universal sentences. Krapf, Johann Ludwig (1810–1881)

S Pugach, Ohio State University, Lima, Ohio

Johann Krapf was born on February 11, 1810, in Derendingen, Württemburg, and died on November 26, 1881, in Korntal, Württemburg. One of four children, he was the son of Johann Jakob Krapf, a farmer, and Katherina Maria Braun. He attended the Osterbergschule in Tübingen, where he discovered a talent for languages, studying Greek, Latin, French, Italian, and Hebrew (Pirouet, 1999). Krapf's next step was training to become a missionary at the Basel Missionary Institute, a training he interrupted to study theology at the University of Tübingen. In 1834 Krapf returned to the mission after a five-year hiatus, in which time he had been ordained and become a parish minister.

At this point the German Krapf joined the British Church Missionary Society, and in 1837 was sent to help found a mission station in Abyssinia. After unsuccessfully trying to establish the station and being driven from the region, Krapf moved to Shoa, in southern Ethiopia, before he was ultimately forced to go even further south, to Mombasa (Miehe, 1983). During his 19 years in Africa, Krapf achieved fame in two arenas: as a writer of historical travelogues, and as a linguist who compiled grammars and biblical translations for several languages. In this second capacity, Krapf belonged to a group of German missionaries, among them S. W. Koelle and J. F. Schön, who introduced the discipline of African linguistics to Europe (*see* **Koelle, Sigismund Wilhelm (1823–1902)**).

Once in Ethiopia, Krapf quickly immersed himself in language study, learning Oromo (Galla), Amharic, and Ge'ez [Geez]. He translated the Gospels of John and Matthew into Oromo, and wrote his first grammar and dictionary. In Shoa, Krapf became embroiled in a short controversy concerning whether to print Bibles in Amharic or Ge'ez; the British and Foreign Bible Society, which published Krapf's work, argued

for Amharic, but Krapf insisted that, because the natives of the area did not like Amharic, biblical translations should instead be printed in both Amharic and Ge'ez, with the languages side by side (Krapf, letter to the British and Foreign Bible Society, Archives of the British and Foreign Bible Society, Cambridge, August 1839). While in Ethiopia, Krapf also gathered samples of Amharic and Ge'ez handwriting, which he sent back to Europe for analysis. In 1842, his achievements in Ethiopia were recognized when his alma mater, the University of Tübingen, awarded him a doctorate for his Ethiopian work.

After Krapf left Ethiopia, he settled in Mombasa, where he lived from 1844 to 1855. Krapf lost his first wife, Rosina, and their daughter to illness during their first year in Kenya. In 1846 he was joined by Johannes Rebmann, who commonly accompanied Krapf on his journeys to the interior, and also collaborated with him on linguistic work. During their journeys, Rebmann and Krapf became the first Europeans to reach Mount Kilimanjaro (Krapf, 1858, 1860). In East Africa, Krapf studied Swahili and several related languages, including Kinika (Kirabai), the language of the Mijikenda. A nine-page biblical translation of Genesis, which Krapf completed not long after his arrival in Mombasa, was the first Swahili text printed in Roman script. In 1850 Krapf compiled a short comparative vocabulary of six East African languages, which also contained ethnographic information on the peoples who spoke them (Krapf, 1850). Krapf commented on the affinity of the six languages, and on their connection to a much larger family of languages spoken throughout sub-Saharan Africa. These were the Bantu languages, though Krapf did not name them as such; his colleague Wilhelm Bleek, Cape Colony governor Sir George Grey's librarian, was instead the first to call the language group Bantu (Frankl, 1992).

Krapf's greatest accomplishments in linguistics are undoubtedly found in his work on Swahili. Krapf was the first to compose a Swahili grammar, which was published in 1850. Frankl suggests that Krapf would have been the first to publish a Swahili dictionary, too, but white ants destroyed much of his research, delaying publication until 1882, a year after Krapf's death. In 1860 Krapf did, however, see a shorter version of his lexicon disseminated by the London Society for the Propagation of the Gospel. Thus, while Bishop Edward Steere's Swahili handbook predated Krapf's complete dictionary (Steere, 1870), Krapf was nonetheless a pioneer in the European study of Swahili (Frankl, 1992).

In 1853 Krapf left Kenya for health reasons, stopping briefly in London before settling permanently in Korntal, where he married twice more before his death in 1881. Krapf maintained his involvement with the mission from afar, advising other missionaries from his home in Germany and making several brief trips to Africa after his retirement. He was in constant communication with the British and Foreign Bible Society, and continued to translate biblical texts into Oromo and Amharic long after he had returned to Germany (Pirouet, 1999).

Kratzenstein, Christian Gottlieb (1723–1795)

C Neis, Potsdam University, Potsdam, Germany

Christian Gottlieb Kratzenstein was born on January 30, 1723 in Wernigerode (Germany) and died on July 7, 1795 in Copenhagen. Kratzenstein was a leading physician, physicist, and natural scientist in the 18th century. Among linguists, he is known as the inventor of a 'speaking machine.'

His father was a school teacher and burgomaster in Wernigerode, where Kratzenstein obtained an excellent education at the local grammar school. In 1742, he started his studies at the University of Halle where he published his first book: *Beweis, dass die Seele ihren Körper baue* in 1743. In this work, he discussed problems like the preformation theory, which regarded organic molecules as determinants of every new creature from the time of Adam and Eve onwards. Kratzenstein discussed the attractive force of Newton in his *Abhandlung von dem Einfluß des Mondes in die Witterungen und in den menschlichen Cörper: Wobey er zugleich zu seinen künftigen Vorlesungen einladet* (1746 and 1747), defended his own *Theoria fluxus diabetici eiusque curandi methodus more geometrice pro gradu Doctoris* (1746) and dealt with worms in the human body (*Abhandlung von der Erzeugung der Würmer im menschlichen Körper*; Kratzenstein, 1748). Most important, however, was the prize essay he sent to the Academy of Bordeaux in 1743 on *Théorie de l'élévation des vapeurs et des exhalaisons, démontrée mathématiquement, qui a remporté le prix, au jugement de l'Académie des belles lettres, sciences et arts.* (Kratzenstein, 1743b), for which he obtained a gold medal. In this treatise he showed that the effluvia (*vapeurs, Dünste*) *which rise from water are invisible air-filled bubbles*. (*These effluvia are invisible as long as being connected in quiet air. But when separated, they become invisible and reflect light according to the laws of Descartes.*) Stimulated by his professor Johann Gottlob Krüger (1715–1759), Kratzenstein wrote his *Schreiben vom Nutzen der Electricität in der Arzneywissenschaft* in 1744 (published in 1772), in which he presented electricity as an omnipotent remedy against every kind of disease. In 1746, he became a doctor of philosophy as well as a doctor of medicine at the University of Halle, where he was subsequently appointed as professor of physics. In 1748, he became a professor of mathematics and mechanics at the Academy of St Petersburg, which attracted many distinguished savants from Western Europe by that time. Kratzenstein was ordered to make mechanical instruments. He conducted experiments with microscopes and optic instruments, supervised patients suffering from diseases in the hospital of the Academy and gave lectures. He also developed new methods of navigation by inventing instruments for the measurement of longitude and latitude degrees and the polar altitude. After long struggles with Mikhail Vasilievich Lomonosov (1714–1765) and other scientists who were opposed to the multitude of foreign professors at the Academy, Kratzenstein left St Petersburg and became a professor of physics in Copenhagen. Until 1786, he gave lectures on different disciplines of the natural sciences, e.g., physics, natural history, botany, zoology, mineralogy, medicine, pharmacology, and chemistry. In 1780, Kratzenstein received the prize of the St Petersburg Academy for his work on artificial human voice. He constructed a 'speech machine' capable of imitating five vowels, which resembled to the *vox humana* register of baroque organs. Kratzenstein was the first to use the free reed and thus inspired the construction of free-reed instruments such as the glass-harmonica, the harmonica, and the accordion.

Kratzenstein was an ingenious scientist whose mechanical reconstruction of the human voice was a first attempt at the creation of artificial voice production.

Krio

P M K Thomas, University of Oxford, Oxford, UK

The Sociohistorical Development of Krio

Krio, one of the languages spoken in Sierra Leone in West Africa, is a creole language belonging to the Atlantic group of English creoles which are restructured languages with English as the superstrate language and varying degrees of structural influences of the Niger–Congo languages in Africa. It can be further subcategorized as West African on the basis of its areal distribution and immediate linguistic affiliations.

The Domestic and Jamaican hypotheses are two competing views that have been postulated for the origins of Krio. The Domestic Hypothesis, a corollary of monogenesis, is advocated by Hancock (1986) and other creolists. It is argued that Krio is an offshoot of an English variety of creole, which coexisted with and was influenced by a Portuguese-derived pidgin in West Africa. According to Whinnom (1965), this pidgin was related to Sabir, a Romance pidgin and Mediterranean lingua franca spoken between European and non-European sailors and traders from the Middle Ages to the early 20th century. A lesser known version of the Domestic Hypothesis is based on the view stated in E. D. Jones (1956), Berry (1959), and Peterson (1969) that contact between the local inhabitants and various groups of settlers after the founding of the 'Province of Freedom' in the peninsula of Sierra Leone in the 19th century gave rise to Krio.

Sociohistorical developments in the late 18th century and the first half of the 19th century and the attendant linguistic situation around the Sierra Leone peninsula contributed significantly to the establishment and spread of present day Krio. Henry Smeathman, a botanist, who had lived for 3 years on the Banana Island near the Sierra Leone River from 1771 to 1774, proposed the area as suitable for the establishment of an agricultural settlement populated by a free community of equal blacks and whites. Smeathman died before realizing his dream, but his idea was revived by Granville Sharp, one of the philanthropists behind the campaign to repatriate and rehabilitate emancipated African ex-slaves. Following the abolition of slavery in Britain in 1787, emancipated ex-slaves in London became destitute and created a social problem for the British government. Spitzer (1974: 9) describes their destitution and the acute need for repatriation and rehabilitation of these ex-slaves who became known as the Black Poor. A group of philanthropists campaigned vigorously for the identification, purchase, and establishment of a settlement for the Black Poor. Sharp and a group of social reformers known as the The Clapham Sect pioneered the repatriation of 411 Black Poor and some English women to the peninsula of Sierra Leone in 1787.

When they arrived in Sierra Leone, Captain Thompson, who was the leader of the expedition, purchased a piece of land from King Tom, the Temne Chief. The piece of land became known as The Province of Freedom and Thompson called the first settlement Granville Town after Granville Sharp. Historians have attributed the collapse of the first settlement to problems ranging from the fact that the settlers were ill-equipped for the weather to hostilities between the settlers and the Temnes. This occasioned a dispersal of the first settlers so that by 1791 only 48 of the Black Poor remained in The Province of Freedom.

The formation of the Sierra Leone Company and the repatriation of 1131 Africans from Nova Scotia in

The Domestic Hypothesis, a corollary of monogenesis, is advocated by Hancock (1986) and other creolists. It is argued that Krio is an offshoot of an English variety of creole, which coexisted with and was influenced by a Portuguese-derived pidgin in West Africa. According to Whinnom (1965), this pidgin was related to Sabir, a Romance pidgin and Mediterranean lingua franca spoken between European and non-European sailors and traders from the Middle Ages to the early 20th century. A lesser known version of the Domestic Hypothesis is based on the view stated in E. D. Jones (1956), Berry (1959), and Peterson (1969) that contact between the local inhabitants and various groups of settlers after the founding of the 'Province of Freedom' in the peninsula of Sierra Leone in the 19th century gave rise to Krio.

Sociohistorical developments in the late 18th century and the first half of the 19th century and the attendant linguistic situation around the Sierra Leone peninsula contributed significantly to the establishment and spread of present day Krio. Henry Smeathman, a botanist, who had lived for 3 years on the Banana Island near the Sierra Leone River from 1771 to 1774, proposed the area as suitable for the establishment of an agricultural settlement populated by a free community of equal blacks and whites. Smeathman died before realizing his dream, but his idea was revived by Granville Sharp, one of the philanthropists behind the campaign to repatriate and rehabilitate emancipated African ex-slaves. Following the abolition of slavery in Britain in 1787, emancipated ex-slaves in London became destitute and created a social problem for the British government. Spitzer (1974: 9) describes their destitution and the acute need for repatriation and rehabilitation of these ex-slaves who became known as the Black Poor. A group of philanthropists campaigned vigorously for the identification, purchase, and establishment of a settlement for the Black Poor. Sharp and a group of social reformers known as the The Clapham Sect pioneered the repatriation of 411 Black Poor and some English women to the peninsula of Sierra Leone in 1787.

When they arrived in Sierra Leone, Captain Thompson, who was the leader of the expedition, purchased a piece of land from King Tom, the Temne Chief. The piece of land became known as The Province of Freedom and Thompson called the first settlement Granville Town after Granville Sharp. Historians have attributed the collapse of the first settlement to problems ranging from the fact that the settlers were ill-equipped for the weather to hostilities between the settlers and the Temnes. This occasioned a dispersal of the first settlers so that by 1791 only 48 of the Black Poor remained in The Province of Freedom.

The formation of the Sierra Leone Company and the repatriation of 1131 Africans from Nova Scotia in

March 1792 saw the revival of the settlement and the return of some of the first settlers. The Nova Scotians were ex-slaves from the American colonies who had gained their freedom by fighting on the side of the British during the American War of Independence. After the war, they were offered asylum in the British settlement in Nova Scotia. When Thomas Peters, one of the ex-slaves, complained of their ill treatment in Nova Scotia, the British government transported them free to Sierra Leone where, together with the surviving Black Poor, they began a colony they called Free Town. Lieutenant John Clarkson of the Royal Navy, who led the Nova Scotians, became the first Governor of Sierra Leone. Like Granville Town, Free Town (Freetown became the capital of Sierra Leone) also had its fair share of misfortunes. Forty of the Nova Scotians died in the first few weeks of their arrival in the colony. Furthermore, the French razed the settlement to the ground in September 1794, but the surviving settlers rebuilt it.

In 1800, 550 Maroons from Jamaica arrived in the settlement. The Maroons were descendants of slaves who were originally from the Gold Coast but had been taken to Jamaica in the West Indies. They had organized several rebellious campaigns against the British and were promised an amnesty if they surrendered. The British expelled them to Halifax in Nova Scotia but during the bitter winter of 1796–1797, they petitioned to be removed to another place and were taken to Sierra Leone. Instead of being resettled in the Banana Islands, south of the peninsula, they settled in the colony after assisting to foil an uprising in the province. The Maroon population is reported to have dwindled after a decade because some of them died from diseases and others migrated to their original home in the Gold Coast, now known as Ghana.

When the slave trade was prohibited in 1808, Freetown became a Crown Colony. From then on it served as the springboard for British legal and naval operations aimed at combating the slave trade along the West Coast of Africa. Between 1808 and 1864, slave ships were intercepted on the high seas and the redeemed Africans, referred to as Liberated Africans or Recaptives, were released initially in Freetown, and later in other British ports. The Liberated Africans never landed in the New World and, according to Spitzer (1974: 10), "were of heterogeneous ethnic origin, speaking a Babel of African languages." The last batches of settlers were from ethnic tribes in Sierra Leone and other West African countries including Ghana and Nigeria.

The languages spoken in Freetown, including a dialect of West African pidgin/creole, coexisted with English, which was the official language used in the administration of the settlement. Even if historians and creolists disagree on when an English pidgin was first used on the coast of West Africa, or on the ethnolinguistic and demographic composition of the settlement, it is argued here that all of the languages spoken in the settlement, approximately 150 according to Koelle (1854), played roles in the creolization process that produced Krio. The African languages included Temne, the language of the people who sold The Province of Freedom to the first settlers, Mende, Sherbro, Joloff, Bambara, and Kissi. The adstratal influence of settlers from Barbados on the development of Krio probably occurred later, between 1819 and 1896 when, as Berry (1959: 299) points out, convicts from Barbados and disbanded troops from the 2nd and 4th West Indian Regiments were among the early colonists in Sierra Leone from the Caribbean area.

Thus, two periods can be identified in the development of Krio: the pre-1787 period during which a variety of West African creole was spoken in the Sierra Leone estuary and the post-1787 period (between 1787 and the 1860s) during which what is Modern Krio became established out of linguistic input from West African creole, New World creoles, and West African languages. From 1787 onward, the Sierra Leonean variety of West African creole and nascent Krio later converged as a result of pressure from and prestige of the latter. The process, which involved different creole varieties and West African languages, aptly demonstrates the roles of leveling and reconstruction in the creolization model.

Krio spread from Freetown to the interior of Sierra Leone and other West African countries due to the strategic role of Sierra Leone as the base from which Britain spread its colonial administration. The British employed educated Krio and sent them as administrators to other West African colonies in the 19th century. Varieties of Krio are spoken today in the Gambia, Cameroon, Guinea, Senegal, Ghana, Nigeria, and Fernando Po, which is now known as the Island of Bioko.

'Creo' and 'Creole' have been used as variant names for Krio but Fyle and Jones (1980) and Wyse (1980) argue that 'Akiriyo,' a Yoruba term which refers to the Krio habit of paying visits after religious services is the most plausible derivation of Krio. According to Hancock (1969: 19) in the past, 'Creole' was the generic term for the settlers and their descendants, from 1787 to the second half of the 19th century, and their language. At an orthographic conference held in Freetown in April 1984, participants recommended the adoption of Krio as the official designation of the language and name of the people. Krio is today one of the national languages of Sierra

Leone. It is estimated that native speakers of Krio constitute 3% of the population of Sierra Leone and two-thirds of the rest of the population of the country use the language as a lingua franca. The native speakers inhabit mostly Freetown and the western area of the country.

Krio has not decreolized for a variety of reasons. It has been used by writers as a medium of poetry, drama, and short stories. There is a Krio–English dictionary, portions of the Bible including the New Testament have been translated into Krio and many plays performed in Sierra Leone today are written in Krio. Most importantly, Krio has enjoyed an enhanced social status as one of the official languages of Sierra Leone. It is regarded as a full-fledged Sierra Leonean language and not a corrupt bastardized version of English. Along with the other Sierra Leonean languages, it is used in television broadcasts, as well as most business and official public engagements.

Official recognition of the language also extends to education. In the past, an additive bilingual program of language shelter was widely practiced in primary schools throughout the country. Children in primary schools used to be taught to a large extent through the medium of their first language and English was slowly introduced. The program of immersion had the educational aim of enriching the experiences of the children. The indigenous languages and cultures were maintained and further developed as they interacted with English. Sierra Leone's current education policy requires the extension of the use of Krio and the other indigenous languages to secondary education and there is ongoing work to standardize these languages and produce materials for use at this level. This policy will contribute to the extension of the domains of use and the continued stability and spread of Krio as well as the other national languages.

In addition to the other reasons given above, Krio has not decreolized notwithstanding pressure from English, the lexifier language, because it carries no stigma and is an identity marker.

Some Grammatical Features of Krio

Krio uses separate morphemes to express grammatical categories. In general, the plural is marked by the particle *dɛm*, for example:

dɛm pɛn
PLURAL pen
pens
pɛn dɛm
pen PL(URAL)
pens

Whereas English plural forms can be indicated by the suffixes -s, or -es, some Krio words appear to have suffixes attached without necessarily indicating plurality. Such words were acquired from English in their present forms and can be used with reference to both singular and plural objects, for example:

machis
'match'
sus/shuz
'shoe'

The possessive is marked by the particle *in*, for example:

Patrik in buk
Patrick POSSESSIVE book
'Patrick's book'

De or *di* is the progressive marker, for example:

Idit de rait.
Edith PROGRESSIVE write.
'Edith is writing.'

In certain contexts, verbs without preverbal particles express the default past tense but the particle *bin* is the past tense marker, for example:

Banadɛt bin rait.
Bernadette PAST rait.
'Bernadette wrote.'

Go is the future marker, for example:

Lamin go rait.
Lamin FUTURE rait.
'Lamin will write.'

Dɔn is the perfective marker and it combines with *bin* to express the past perfect, for example:

Angela dɔn rait.
Angela PRESENT PERFECT write.
'Angela has written.'
Mamie bin dɔn rait.
Mamie PAST PERFECT write.
'Mamie had written.'

Blan(t) 'used to' is a habitual aspect marker and the modal markers which can cooccur in a sequence as double or multiple modals are *mɔs* 'must,' *fɔ* 'should,' *go* 'intend to, must,' and *kin* 'can, could.' Consider the following examples:

I blant rait.
She HABITUAL ASPECT write.
'She usually writes.'
A bin fɔ mɔs dɔn rait.
I PAST + MODAL + MODAL + PERFECTIVE write.
'I should (would) most certainly have written.'

Some particles are multifunctional and the different functions are determined by context. These particles include:

- *Na* can function as a locative 'in, at, to,' verbal particle 'is,' and adjectival 'that.'
- *ɔt*, a preposition 'out' also functions as verb for 'extinguish, put out.'
- *De* functions as a verb 'to be,' durative marker, and locative adverb 'there.'
- *Bin* functions as a past tense marker and aspect marker.
- *Fɔ* functions as a preposition, modal auxiliary, main verb, and complementizer or infinitive marker.
- *Go* functions as a verb and modal particle.
- *Blant* is not only a past habitual marker 'used to,' but also functions as a main verb 'belong to.'

Other grammatical features of Krio include:

- multiple negation, for example:

  Nɔ tɔk tu am no moh.
  NEGATOR talk to him NEGATOR more.
  'Do not talk to him any more (again).'

- Serial verbs in Krio have the following basic structure:

  NP_1 Aux V_1 (NP_2) V_2 . . .
  Agnɛs bin kuk rɛs gi Josɛf.
  Agnes (NP_1) bin (PAST AUXILIARY) cook (V_1) rice (NP_2) gi (V_2) Joseph.
  'Agnes cooked some rice which she gave to Joseph.'

- focus constructions involving *na* 'it-is,' for example:

  Na Mari bin kɔ'l.
  It-is Mary PAST call.
  'Mary called.'

Some Lexical Features of Krio

Many Krio words are of African origin. The main Sierra Leonean sources of the lexical items include, Mende, Temne, Sherbro, Susu, Yalunka, Limba, Kru, Vai, Fullah, and Mandingo. The other major African sources include, Yoruba, Wolof, Twi, Hausa, and Ibo. Most of the African items have multiple origins and indicate the multiple connections of the language as shown below:

Word	Sources	Meaning
banda	Mende, Kongo, Swahili	a basket made of palmetto straw or of marsh grass and sewn with palmetto, or a thatched house
bara (bala, balanji)	Bambara, Susu, Mandingo	a xylophone
bene	Wolof, Bambara, Mende	benne, sesame
fufu	Twi, Ewe, Wolof, Fon, Mende, and Hausa	mush, wheat flour made into a thin batter and cooked
nyam/ nyamnyam	Wolof, Fullah, Mbundu, Mandingo, Tshiluba, Efik, and Twi	to eat, eat up, food

Other sources of the lexicon of Krio include European languages: mainly English, Portuguese, Spanish, and French. The largest number of words in the lexicon of this creole derives from English. Between 70% and 80% of the Krio lexicon is derived from English and a lot of the words reflect an archaic usage in English. Examples include:

berin 'a funeral, a burial.' Recorded in the OED as *bering(e)*, it is either obsolete or occurs in English dialects.
titi 'girl' and *krabit* 'miserly, mean' are Scottish representations
bre/ribre 'nag' comes from northern English dialect
kɔstamɛnt 'customer' appears in the OED as an obsolete word *customance/custumaunce* in use as far back as 1386, which means 'customary practice; custom, habit, customary gathering, frequenting'
baksay 'buttocks' is a fossil of an earlier English compound *baksyde*, *backeside* meaning 'the hinder or back part, the back, the rear.'

Vulgar words highlight slang and vulgar usages but some of these words have lost their European connotations. Examples include:

pis 'urine'
switpis 'diabetes'
pisbag 'bladder'
pishol 'urethra'

Some of the Krio words represent semantic Africanisms, for instance:

bif 'meat'
fut 'leg, thigh'
met 'co-wife'

Although some Krio words are different from their English etyma, they are related to their etyma via a semantic change through inference, for instance:

bisin 'to care, be concerned about' from 'business'
drap 'arrive unexpectedly' from 'drop'
bot 'to gang up' from 'both'
ton 'penis' from 'stone'

Words derived directly from Portuguese, Spanish, and French include:

pikin 'child' (derived from Portuguese *pequenno* 'little' or Spanish *pequeño*),
bɔku 'plentiful, abundant' (derived from French '*beaucoup*'),

farinha 'flour' (derived from Portuguese but can also be traced to French *farine*)
sabi 'skill, knowledge' (derived from Portuguese *sabir* 'know' or Spanish *saber.* It also occurs in English as *savvy*)
plaba 'quarrel' (derived from Portuguese *palavra* 'words, talk,' Spanish *palabra*, Italian *parola*, French *parole*, and Latin *parabola* 'parable.')
dash 'present' (derived from Portuguese *das-me* 'give me')

Compounds

Some Krio compounds are created by juxtaposition of words of different grammatical categories. Some of the compounds are derived from English phrasal verbs for example:

fɔdɔm 'fall, fall down'
mekes 'hurry'
tayup/tringup 'tie up'

Two or three morpheme parallels in question words include:

wetin 'what'
udat 'who'
usay/wisay 'where'
ustem/wataym 'when'
wetin-du/mek-so 'why'
ɔmɔs/hɔmɔch 'how many'

Other compounds with different bases are instances of the use of metaphoric language through idiomatic calquing, for example:

Adjectives	Body parts (nouns)	Compound
big 'big'	*mɔt* 'mouth'	*bigmɔt* 'boastfulness'
gud 'good'	*bele* 'belly'	*gudbele* 'kind hearted'
big 'big'	*yay* 'eye'	*bigyay* 'greedy'

Other socially and culturally determined compounds include:

santem (sun time) 'midday'
domɔt (door mouth) 'door'
dede-hos (dead house) 'mortuary'
simun 'menstruation'

Some compounds are gender, occupation, actor, and nationality constructions, for example:

umanfɔl 'hen'
bɔy pikin 'male child'
gyal pikin 'female child'
inglishman 'Englishman'
amerikinman 'American'
ganaman 'Ghanaian'

There is also evidence of semantic calques and extensions as the forms borrowed from English gain new meaning. For example:

ɔpstyas 'the brain' (from 'upstairs')
bizi 'menstrual period' (from 'busy')
yad 'toilet' (from 'yard')
big 'older, wealthy, important'

Epenthetic vowels are inserted between consonants where clusters occur in English words, for example: *tikitul* 'kettle'

Reduplication

The following types of complete reduplication have been attested in Krio:

- intensive reduplication of adjectives, adverbs and verbs

Simplex forms	Reduplicated morphemes
tru 'true'	*trutru* 'very true'
dɛ 'there'	*dɛdɛ* 'exactly there; correct'
ay 'high'	*ayay* 'very high'
kwik 'quickly'	*kwikkwik* 'very quickly'

The following reduplicated verbs also indicate an increase in degree and/or intensity:

Simplex forms	Reduplicated morphemes
baŋ 'bang'	*baŋbaŋ* 'very loud noise'
fred 'be frightened'	*fredfred*, 'very frightened'

- iterative/repetitive/frequentative reduplication of verbs

Simplex forms	Reduplicated morphemes
aks 'ask'	*aksaks* 'repeated asking around'
chenj 'change'	*chenjchenj* 'habitually/always/ constantly changing'

- distributive reduplication of numerals

Simplex forms	Reduplicated morphemes
wan 'one'	*wanwan* 'one by one' or 'one to each'
tu 'two'	*tutu* 'two by two' or 'two to each'

- pluralizing reduplication of nouns.

- plurality bordering on uncountability, for example:

Simplex forms	Reduplicated morphemes
af 'half'	*afaf* 'bits', 'halves'
chuk 'thorn'	*chukchuk* 'thorns'

- increased mass, for example:

Simplex form	Reduplicated morpheme
chaf 'chaff'	*chafchaf* 'chaff'

Some Phonological Features of Krio

Consonants

The voiceless dental fricative /θ/ and the voiced dental fricative /ð/ are often occluded. The voiceless dental

fricative /θ/ is reduced to /t/ or in some dialects /f/, for example:

tin 'thin'
tiŋk 'think'

The voiced dental fricative /ð/ is replaced by the alveolar /d/, for example:

da 'that'
dis 'this'
dɛn 'then'

The voiceless glottal fricative /h/ is often omitted in initial positions, for example:

ol 'hold'
os 'house.'

Initial unstressed sounds are omitted in many words, for example:

gri 'agree'
mɛmba 'remember'
chenj 'exchange'
bot/bɒʊt/ 'about'

Consonant clusters involving a fricative and stop in final positions are often reduced, for example:

was was/was 'wasp'
gens 'against'
han 'hand'
fɔs 'first'
brɛs 'breast'

The stop after /l/ is often dropped and the rule appears to be the reduction of the clusters /lt/ and /ld/ to /l/ in final positions for instance:

/*sɔl*/ 'salt'
ol 'old'
wɔl 'world'

The /l/ before a labial consonant or a dental stop at the end of a word is deleted for example:

ɛp/hɛp 'help'
sef/sɛf 'self'

The final voiced stop /d/ in words ending in /nd/ is omitted, for example:

san 'sand'
tan 'stand'
blɛn 'blind'

Like some West African languages such as Mende and Temne, Krio has the following voiceless and voiced labiovelar coarticulated stops:

/kp/
/gb/

Krio has the following prenasalized stops:

/mb/, /nt/, /ŋg/, and /ŋk/

Consonants are palatalized and the different types are:

- nasalized palatal glide

  /ny/

- palatalized alveolars

  /dy/, /sy/, /ty/, and /zy/

- palatalized velars

  /gy/ and /ky/

The sound /v/ is realized as /b/ in certain words, for example:

ib 'heave'
oba 'over'
dreb 'drive'
koba 'cover'

The /v/ in final positions is often rendered as /f/, for example, 'move' is pronounced /muf/.

Adjacent consonants are often transposed. This is known as metathesis and examples include:

/ask/ 'ask' is pronounced /aks/
/rɪsk/ 'risk' is pronounced /riks/
/mɒsk/ 'mosque' is pronounced /mɔks/

Although this is irregular, there is evidence of rhoticism in Krio in a word like /bʁitʃ/ 'bleach' in which /l/ is realized as /r/.

Vowels and Diphthongs

Krio has seven pure vowels and the vowels lack corresponding pairs of long and short vowels. It also has three diphthongs, /ai/, /au/, and /ɔi/. Variants of these diphthongs are /ay/, /aw/, and /oy/. Vowels are introduced to replace English diphthongs for example:

/e/ replaces /eɪ/
/o/ replaces /əʊ/

Vowels are added at the end of a word. These are known as paragogic vowels. Examples include:

gladi 'glad'
dede 'dead'
arata 'rat'
lili 'little'

Suprasegmentals

Krio is a tone language whose intonation is influenced by African tonal languages. There are two tones, a

low tone / ̀/ which is low in all positions and a high tone / ́/. The falling pitch /ˆ/ is used as a realization of the high tone. Tone is syllable-timed and each Krio word or segment has a relevant pitch pattern. Every syllable has a separate tone or relative pitch that is unrelated to stress. The pitch of syllables causes differences in meaning.

Kripke, Saul (b. 1940)

F Buekens, Tilburg University, Tilburg, The Netherlands

American logician and philosopher Saul Kripke was born in Omaha, Nebraska in 1940. Kripke is best known for three contributions to philosophy: he developed a semantics for modal logic and published, at an early age, completeness theorems for propositional modal logic (Kripke, 1959) and modal logic with quantification (Kripke, 1963). Reintroducing the venerable Leibnizian notion of a possible world into philosophy, he reestablished analytical metaphysics as a respectable discipline. His 1970 lectures 'Naming and necessity,' later published as a book under the same title in 1980, had an immense influence on contemporary developments in the philosophy of language.

Kripke forcefully argued, with John Stuart Mill and against Gottlob Frege, that ordinary proper names like 'Aristotle' or 'Kurt Gödel' did not refer via a mediating sense or description, but directly. According to the 'picture' Kripke favors – he refused to call his views a theory – a name 'N' refers to a bearer x when the current use of 'N' can be traced back, via a causal–communicative chain, to an initial baptism episode where 'N' is introduced in the language to refer to x. The conceptual apparatus developed in his semantics for modal logic allowed him to reintroduce the distinction between necessity and contingency (a statement is necessarily true only if it is true in all possible words; contingently true if it is true in a world *w* and false in a world *w*'), and to claim, against a wide orthodoxy, that identity statements flanked by names ('rigid designators') are necessarily true, even though they are empirical discoveries: 'Hesperus, the Morning Star, is identical with Phosphorus, the Evening Star,' is a necessary though *a posteriori* truth.

Kripke applied his semantic theories to natural kind terms ('water' or 'tiger'), claiming that the way we fix the reference of natural kind terms may or may not reveal the essential properties of the substances or species they refer to. Kripke's semantic and metaphysical theories provided a framework in which old questions could be reformulated and new questions could be asked: When is a term a natural kind term? What is necessity? What is the relation between conceivability and possibility? Are physical laws metaphysically necessary?

Philosophy of mind was another area in which his ideas gained a foothold (if an essential property of 'pain' is that it 'feels like pain,' can pains be identical with physical states or events)? Kripke also made interesting contributions to the study of the later Wittgenstein in lectures published as *Wittgenstein on rules and private language* (1982), although his work here has been faulted for being not particularly true to the historical Wittgenstein.

Kroeber, Alfred Louis (1876–1960)

P P Chruszczewski, University of Wrocław, Wrocław, Poland

Alfred Louis Kroeber (Kröber) (1876–1960) was born in Hoboken, New Jersey, on June 11 to upper-middle-class Protestant parents of German ancestry. The family was thoroughly bilingual, with German being spoken at home. During his childhood Kroeber was introduced to Greek and Latin, which made him interested in linguistics. He attended Columbia University, majoring in English (B.A., 1896; M.A., 1897), and took his doctorate there in 1901 under Franz Boas, having presented a 28-page dissertation on 'Decorative symbolism of the Arapacho.'

Kripke, Saul (b. 1940)

F Buekens, Tilburg University, Tilburg, The Netherlands

American logician and philosopher Saul Kripke was born in Omaha, Nebraska in 1940. Kripke is best known for three contributions to philosophy: he developed a semantics for modal logic and published, at an early age, completeness theorems for propositional modal logic (Kripke, 1959) and modal logic with quantification (Kripke, 1963). Reintroducing the venerable Leibnizian notion of a possible world into philosophy, he reestablished analytical metaphysics as a respectable discipline. His 1970 lectures 'Naming and necessity,' later published as a book under the same title in 1980, had an immense influence on contemporary developments in the philosophy of language.

Kripke forcefully argued, with John Stuart Mill and against Gottlob Frege, that ordinary proper names like 'Aristotle' or 'Kurt Gödel' did not refer via a mediating sense or description, but directly. According to the 'picture' Kripke favors – he refused to call his views a theory – a name 'N' refers to a bearer x when the current use of 'N' can be traced back, via a causal–communicative chain, to an initial baptism episode where 'N' is introduced in the language to refer to x. The conceptual apparatus developed in his semantics for modal logic allowed him to reintroduce the distinction between necessity and contingency (a statement is necessarily true only if it is true in all possible words; contingently true if it is true in a world *w* and false in a world *w*'), and to claim, against a wide orthodoxy, that identity statements flanked by names ('rigid designators') are necessarily true, even though they are empirical discoveries: 'Hesperus, the Morning Star, is identical with Phosphorus, the Evening Star,' is a necessary though *a posteriori* truth.

Kripke applied his semantic theories to natural kind terms ('water' or 'tiger'), claiming that the way we fix the reference of natural kind terms may or may not reveal the essential properties of the substances or species they refer to. Kripke's semantic and metaphysical theories provided a framework in which old questions could be reformulated and new questions could be asked: When is a term a natural kind term? What is necessity? What is the relation between conceivability and possibility? Are physical laws metaphysically necessary?

Philosophy of mind was another area in which his ideas gained a foothold (if an essential property of 'pain' is that it 'feels like pain,' can pains be identical with physical states or events)? Kripke also made interesting contributions to the study of the later Wittgenstein in lectures published as *Wittgenstein on rules and private language* (1982), although his work here has been faulted for being not particularly true to the historical Wittgenstein.

Kroeber, Alfred Louis (1876–1960)

P P Chruszczewski, University of Wrocław, Wrocław, Poland

Alfred Louis Kroeber (Kröber) (1876–1960) was born in Hoboken, New Jersey, on June 11 to upper-middle-class Protestant parents of German ancestry. The family was thoroughly bilingual, with German being spoken at home. During his childhood Kroeber was introduced to Greek and Latin, which made him interested in linguistics. He attended Columbia University, majoring in English (B.A., 1896; M.A., 1897), and took his doctorate there in 1901 under Franz Boas, having presented a 28-page dissertation on 'Decorative symbolism of the Arapacho.'

Kroeber conducted his ethnographic research mainly in the Southwest, the Philippines, the Great Plains, and California, and his archaeological investigations in Mexico and Peru. His linguistic and anthropological studies focused on native Americans (mainly on California Indian languages).

Kroeber was awarded five honorary degrees (Yale, California, Harvard, Columbia, and Chicago). In 1946 he received the Huxley Medal of the Royal Anthropological Society. Kroeber was working on a definition of culture, coming to the conclusion that culture is a product of a historical development (*Anthropology* 1948). He employed a strictly cultural approach and method of analysis while dealing with the history of ancient as well as modern societies. He was of the opinion that, due to numerous parallels between biology and cultural anthropology, cultural phenomena have biological roots ('Historical reconstruction of culture growths and organic evolution' 1931). "The basis of Kroeber's point of view may be called the natural history of culture, with strong emphasis on the humanistic features. That is, Kroeber's main endeavor was to identify the distinguishing features of each culture and to assign them to categories based on the procedures of natural history" (Steward, 1973: 25). Kroeber succeeded in identifying culture as an element of nature also, thanks to his extensive ethnographies of California Indians and their languages (*Handbook of the Indians of California*, 1925) as well as his research on the languages of the South American Indians (*Handbook of South American Indians*, Julian Steward (ed.), 1946–1959).

At the age of 24, Kroeber was offered his first professional position with the California Academy of Sciences in San Francisco. Then in 1906 he was made assistant professor at the University of California at Berkeley (associate professor in 1911 and professor in 1919). During his early years in San Francisco, he underwent several traumatic experiences, including the deaths of his wife and of Ishi, the last survivor of the Yahi-Yana and an excellent source of information concerning Native Americans whom Kroeber had transferred to San Francisco and had supported to live at the Museum. Last but not least of Kroeber's hardships was an ear infection, which resulted in permanent loss of hearing in his left ear.

In 1915–1916, taking his sabbatical year, Kroeber traveled in Europe, coming in contact with Freud's school of analysis in Vienna. Returning to California he became a successful psychoanalyst himself; however, he did not forsake anthropology and gave up psychoanalysis. During his lifetime Kroeber published a total of 460 papers, of which 70 at least partly concern linguistics.

Kru Languages

J Bendor-Samuel, High Wycombe, UK

Kru languages are spoken mainly in the forest areas of southwestern Ivory Coast and southern Liberia. Apart from three languages, they form a contiguous block with Kwa languages to their east, Mande languages to their north and west, and Atlantic languages to their west.

Speakers

Reliable population figures are hard to obtain, but it would seem that there are approximately 2 million people who speak one or other of the Kru languages. The three largest language groups are the Guere

complex (some 400 000 speakers), the Bete complex (approximately 350 000 people), and the Bassa (over 250 000 people).

Kru Studies

Though Sigismund W. Koelle, in 1854, included five Kru languages in his *Polyglotta Africana*, there was little study of these languages until this century. In 1905, Georges Thomann published a grammar of Neyo, but the next substantial work on Kru languages did not appear until 1966, when Gordon Innes published his *Introduction to Grebe* and a Grebe-English dictionary. Subsequently, however, research has begun into many more of the Kru languages, and the work of Marchese (1983, 1986, 1989) has been extensive.

Classification

Greenberg (1963) tentatively included Kru in his Kwa branch of Niger-Congo, but this classification has been rejected by most scholars. Some lexicostatistical studies and the presence of noun class suffixes have suggested that Kru is closer to Gur than to Kwa, though, unlike Gur and Kwa, Kru is nonserializing. More recently, the hypothesis of grouping Kru, Gur, and Adamawa-Ubangi as North Volta-Congo has found increasing acceptance (Williamson and Blench, 2000). However, since systematic lexical study is lacking and in the absence of any conclusive evidence, it seems best to regard Kru as an independent group for the time being.

The Kru languages can be divided into two main groups: eastern and western. Eastern Kru (approximately 500 000 speakers) is spoken exclusively in the Ivory Coast and contains two major subgroups, the Bete complex and the Dida complex. Bete further divides into eastern Bete, spoken in the region of Gagnoa, and western Bete, spoken in a wider area, including Soubre, Guibéroua, Issia, and Daloa. The Dida complex divides into eastern Dida, with six dialects, and western Dida, with two dialect clusters. Kwadia, Bakwe, and Wane are three other eastern Kru languages that do not belong to either the Bete or the Dida complex.

Western Kru (with more than 1 million speakers) is spoken over a considerably larger area compared to eastern Kru and extends from the Sasandra River in the Ivory Coast through southern Liberia. The major division in western Kru is between the Guere complex, Grebo complex, and Bassa. The Guere complex is located in Ivory Coast and comprises some 35 languages/dialects; these may be grouped into four groups: Nyabwa, Wobe, Guere-Krahn, and Konobo. The Grebo complex straddles the Ivory Coast and Liberia border and includes some 25 languages/dialects. In the Ivory Coast, there are two main subgroups: Tepo-Plapo and Pie. In Liberia, there are seven subgroups: Wedebo, Glebo, Jabo, Gedebo, Niaibo, Fopo, and Chedepo. In Liberia, Bassa, with some 15 dialects and some 250 000 speakers, and Klao, with two main dialects, belong to western Kru but lie outside Grebo and Guere.

Three other Kwa languages, Kuwaa, Aizi, and Semɛ, are not grouped with either eastern or western Kru. All three are separate geographically from the rest of the Kru languages. Semɛ is of particular interest since it is located in Burkina Faso, over 300 miles from the nearest Kru language and surrounded by Gur languages. Figure 1, based on work by Marchese, gives a useful summary.

Structural Features

Phonetics and Phonology

Open syllables predominate and words are usually monosyllabic or disyllabic. Vowel sequences occur as do CLV syllables (consonant-L-vowel, where L represents a syllabic l, n, or r). All Kru languages have stops at five points of articulation: bilabial, alveolar, palatal, velar, and labio-velar. A typical Kru vowel system has four front and four back vowels and a central vowel and is marked by vowel harmony with advanced and retracted sets of vowels. Within any one morpheme, only vowels of one set occur.

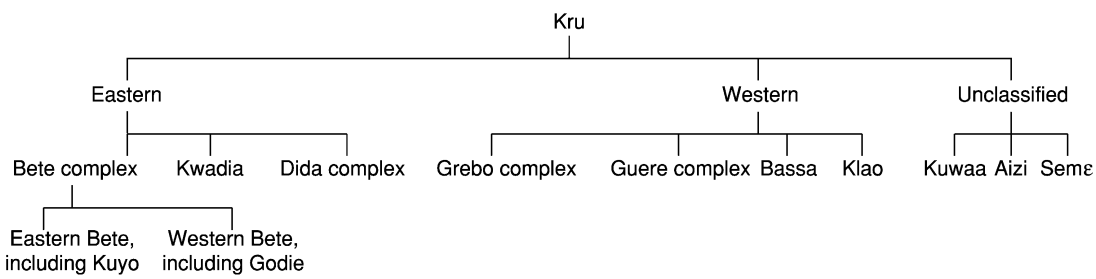

Figure 1 The Kru languages.

Some Kru languages, including Grebo and Krahn, have another type of vowel harmony, with vowels divided into three sets, A, B, and C. Vowels of any one group may cooccur in a morpheme, and vowels of adjacent sets may cooccur. So vowels from set A may occur with vowels from set B, or vowels from set B may occur with vowels from set C, but vowels from set A never cooccur with vowels from set C. Set A consists of i, u, e, and o; set B consists of ɛ, a, and ɔ; and set C consists of *ɩ* and ʋ.

All Kru languages are marked by three or four levels of register tone, which may carry either lexical and/or grammatical functions. Tone, for instance, may distinguish the imperfective from the perfective and the singular from the plural.

Grammar and Syntax

Kru languages have a subject-verb-object (SVO) basic word order, but when an auxiliary is present this changes to S AUX (IO) (DO) V. Kru languages are suffixing. Plurality is often indicated by an *-i* suffix. A number of Kru languages have remnants of noun class suffixes and a few have noun class concord, with agreement between the head and its modifiers. Possessives precede nouns, and body parts function as postpositions indicating direction. Genitives precede nouns, but most modifiers follow their heads.

Kru languages have a basic aspectual system with imperfective and perfective forms marked by suffixes. Progressive and perfect forms are often marked by an auxiliary and so too are conditionals and potential futures. Negation is also frequently signaled by an auxiliary or a particle, though in some languages tone and word order are involved.

Kruisinga, Etsko (1875–1944)

Roselinde Supheert, Utrecht University, Utrecht, The Netherlands

Etsko Kruisinga was born in Leens, the Netherlands, on December 8, 1875, the son of a merchant. He studied Dutch and English at the University of Groningen, graduating with a *kandidaats* degree (approximately a B.A.) in Dutch philology in 1897, as English at the time had not yet been accepted as an academic degree subject in the Netherlands. After passing additional teacher training examinations (M.O. A and B), Kruisinga went on to teach English and Dutch at a number of secondary schools, until he was pensioned off for health reasons at the age of 48. In 1904, he obtained a doctorate from the University of Bonn for his dissertation on the West Somerset dialect. When the Dutch university statute was changed, enabling students to take degrees in foreign languages, Kruisinga was among the first to obtain a doctorate in English from the University of Amsterdam, in 1922.

Although recognized as a major Anglicist by his contemporaries, Kruisinga was never offered a salaried position at a Dutch university. In addition to his career as a schoolteacher, he worked as an unsalaried lecturer at the University of Utrecht from 1909–1915 and was a driving force in language-teacher training. In 1911, he was one of the founders of the Dutch Association of Modern Language Teachers (*Levende Talen*), and in 1922 he became a lecturer at a private teacher training institution in the Hague, the Modern Language Association (*Vereniging Modern Talen*), later called the School of Linguistic and Literary Studies (*School voor Taal- en Letterkunde*). Here he was appointed principal in 1931 and accepted a controversial professorship in 1936.

Some Kru languages, including Grebo and Krahn, have another type of vowel harmony, with vowels divided into three sets, A, B, and C. Vowels of any one group may cooccur in a morpheme, and vowels of adjacent sets may cooccur. So vowels from set A may occur with vowels from set B, or vowels from set B may occur with vowels from set C, but vowels from set A never cooccur with vowels from set C. Set A consists of i, u, e, and o; set B consists of ɛ, a, and ɔ; and set C consists of ɩ and ʋ.

All Kru languages are marked by three or four levels of register tone, which may carry either lexical and/or grammatical functions. Tone, for instance, may distinguish the imperfective from the perfective and the singular from the plural.

Grammar and Syntax

Kru languages have a subject-verb-object (SVO) basic word order, but when an auxiliary is present this changes to S AUX (IO) (DO) V. Kru languages are suffixing. Plurality is often indicated by an *-i* suffix. A number of Kru languages have remnants of noun class suffixes and a few have noun class concord, with agreement between the head and its modifiers. Possessives precede nouns, and body parts function as postpositions indicating direction. Genitives precede nouns, but most modifiers follow their heads.

Kru languages have a basic aspectual system with imperfective and perfective forms marked by suffixes. Progressive and perfect forms are often marked by an auxiliary and so too are conditionals and potential futures. Negation is also frequently signaled by an auxiliary or a particle, though in some languages tone and word order are involved.

Kruisinga, Etsko (1875–1944)

Roselinde Supheert, Utrecht University, Utrecht, The Netherlands

Etsko Kruisinga was born in Leens, the Netherlands, on December 8, 1875, the son of a merchant. He studied Dutch and English at the University of Groningen, graduating with a *kandidaats* degree (approximately a B.A.) in Dutch philology in 1897, as English at the time had not yet been accepted as an academic degree subject in the Netherlands. After passing additional teacher training examinations (M.O. A and B), Kruisinga went on to teach English and Dutch at a number of secondary schools, until he was pensioned off for health reasons at the age of 48. In 1904, he obtained a doctorate from the University of Bonn for his dissertation on the West Somerset dialect. When the Dutch university statute was changed, enabling students to take degrees in foreign languages, Kruisinga was among the first to obtain a doctorate in English from the University of Amsterdam, in 1922.

Although recognized as a major Anglicist by his contemporaries, Kruisinga was never offered a salaried position at a Dutch university. In addition to his career as a schoolteacher, he worked as an unsalaried lecturer at the University of Utrecht from 1909–1915 and was a driving force in language-teacher training. In 1911, he was one of the founders of the Dutch Association of Modern Language Teachers (*Levende Talen*), and in 1922 he became a lecturer at a private teacher training institution in the Hague, the Modern Language Association (*Vereniging Modern Talen*), later called the School of Linguistic and Literary Studies (*School voor Taal- en Letterkunde*). Here he was appointed principal in 1931 and accepted a controversial professorship in 1936.

Throughout his career Kruisinga published an astonishing number of articles, reviews, and books. Together with R. W. Zandvoort, in 1919 he stood at the cradle of the foremost Dutch journal for Anglicists, *English Studies*, which he edited and to which he contributed a series of articles on syntax, among other things. Kruisinga's publications range from phonetics and phonology to English cultural history and editions of literary works. His major contributions to linguistics are in the field of English syntax, notably word groups. Kruisinga's work forms a break with tradition in that he increasingly questioned the relevance of philology at a time when a historical approach was the norm. Thus, for example, in his multivolume *A grammar of present-day English*, which saw numerous later editions as *A handbook of present-day English* and covers syntax, idiom, phonetics, and historical linguistics, the volumes dedicated to syntax draw on authentic sentences from sources such as Thomas Hardy, Elizabeth Gaskell, and the *Times* of London.

In Kruisinga's view, classical languages and the historical study of English did not offer suitable tools for analyzing these samples of a living language. He favored and developed a practical framework, modeled on the language that was to be analyzed, without redundant categories dictated by philology.

Kruisinga's formal approach to grammar reflects the influence of a variety of linguists, such as F. N. Finck, C. C. Uhlenbeck, and H. Sweet, with the latter's distinction between form and meaning being a key influence. Kruisinga's work, in turn, attracted international attention. The later, and more radical, editions of his *Handbook* were widely noticed. The radical nature of his approach, his concentrated style, and his position outside of Dutch university, however, to some extent curtailed his influence.

Kruszewski, Mikołag Habdank (1851–1887)

E F K Koerner, Zentrum für Allgemeine Sprachwissenschaft, Berlin, Germany

Kruszewski was born to Polish parents on December 6, 1851 in Luck (Lutsk), Volhynia, then part of the Ukraine, some 200 miles southeast of Warsaw, and died on November 12, 1887 in Kazan, of a degenerative neurological disease. He went to Warsaw for his university studies, enrolling in psychology and philosophy, and thoroughly absorbed the English empiricist tradition of Bacon (*see* **Bacon, Roger (c. 1214-1292/4)**), Locke (*see* **Locke, John (1632–1704)**), and Hume. After taking his Master's degree with a thesis on incantations in Russian folklore in 1875, he joined Baudouin de Courtenay at the University of Kazan in 1878, having had an intensive correspondence on linguistic issues with him for several years previous to that. At Kazan, Kruszewski soon played an important role in the discussions organized by Baudouin at his home; his background in the behavioral sciences appears to have been one of the reasons for his orientation toward general theory. In his review of Saussure's *Mémoire* (1878; *see* **Saussure, Ferdinand (-Mongin) de (1857–1913)**) and Brugmann's 'Nasalis sonans' article (1876; *see* **Brugmann, Karl (1849–1919)**), he suggested (1880) that a distinction between '*zvuk*' (sound) and '*fonema*' (phoneme) be made, a distinction that made history many years after his death (Kilbury, 1976: 17–23; Klausenburger, 1978). His philosophy of science, however, which was closer to Schleicher (*see* **Schlegel, August Wilhelm von (1767–1845)**) than to the Neogrammarians (notably Hermann Paul; *see* **Paul, Hermann (1846–1921)**), appears to have hampered his success

Throughout his career Kruisinga published an astonishing number of articles, reviews, and books. Together with R. W. Zandvoort, in 1919 he stood at the cradle of the foremost Dutch journal for Anglicists, *English Studies*, which he edited and to which he contributed a series of articles on syntax, among other things. Kruisinga's publications range from phonetics and phonology to English cultural history and editions of literary works. His major contributions to linguistics are in the field of English syntax, notably word groups. Kruisinga's work forms a break with tradition in that he increasingly questioned the relevance of philology at a time when a historical approach was the norm. Thus, for example, in his multivolume *A grammar of present-day English*, which saw numerous later editions as *A handbook of present-day English* and covers syntax, idiom, phonetics, and historical linguistics, the volumes dedicated to syntax draw on authentic sentences from sources such as Thomas Hardy, Elizabeth Gaskell, and the *Times* of London.

In Kruisinga's view, classical languages and the historical study of English did not offer suitable tools for analyzing these samples of a living language. He favored and developed a practical framework, modeled on the language that was to be analyzed, without redundant categories dictated by philology.

Kruisinga's formal approach to grammar reflects the influence of a variety of linguists, such as F. N. Finck, C. C. Uhlenbeck, and H. Sweet, with the latter's distinction between form and meaning being a key influence. Kruisinga's work, in turn, attracted international attention. Kruszewski, Mikotag Habdank (1851–1887)

E F K Koerner, Zentrum für Allgemeine Sprachwissenschaft, Berlin, Germany

Kruszewski was born to Polish parents on December 6, 1851 in Luck (Lutsk), Volhynia, then part of the Ukraine, some 200 miles southeast of Warsaw, and died on November 12, 1887 in Kazan, of a degenerative neurological disease. He went to Warsaw for his university studies, enrolling in psychology and philosophy, and thoroughly absorbed the English empiricist tradition of Bacon (*see* **Bacon, Roger (c. 1214-1292/4)**), Locke (*see* **Locke, John (1632–1704)**), and Hume. After taking his Master's degree with a thesis on incantations in Russian folklore in 1875, he joined Baudouin de Courtenay at the University of Kazan in 1878, having had an intensive correspondence on linguistic issues with him for several years previous to that. At Kazan, Kruszewski soon played an important role in the discussions organized by Baudouin at his home; his background in the behavioral sciences appears to have been one of the reasons for his orientation toward general theory. In his review of Saussure's *Mémoire* (1878; *see* **Saussure, Ferdinand (-Mongin) de (1857–1913)**) and Brugmann's 'Nasalis sonans' article (1876; *see* **Brugmann, Karl (1849–1919)**), he suggested (1880) that a distinction between '*zvuk*' (sound) and '*fonema*' (phoneme) be made, a distinction that made history many years after his death (Kilbury, 1976: 17–23; Klausenburger, 1978). His philosophy of science, however, which was closer to Schleicher (*see* **Schlegel, August Wilhelm von (1767–1845)**) than to the Neogrammarians (notably Hermann Paul; *see* **Paul, Hermann (1846–1921)**), appears to have hampered his success

among the 'mainstreamers' of his day (cf. Koerner, 1986: 380–381, 382–384); it required the reappraisal of his work by Roman Jakobson (1969; *see* **Jakobson, Roman (1896–1982)**) and others to give due recognition to his contribution to the field. Saussure was familiar with Kruszewski's writings, especially those that had appeared in German translation (1881: 1884–1890), and it is there that he could have found a number of ideas that are now familiar from Saussure's *Cours*. These include the arbitrariness of the linguistic sign and the distinction between 'syntagmatic' and 'associative' (since Firth, 1935: 'paradigmatic') relationships, which in Kruszewski's terms were established by the laws of association he had found in Mill's *System of logic* (1843; *see* **Mill, John Stuart (1806–1873)**), namely, those of coexistence and those of similarity. (Only during the 1960s did Jakobson see a parallel between Kruszewski's theory and the two basic types of aphasia.) Kruszewski was also responsible for clarifying the distinction between Lautwandel (sound change) and Lautwechsel (sound alternation), a distinction incorporated by Paul in the second edition of his *Principien* (1886) without due acknowledgment. In other words, Kruszewski was quite clear about the essential difference between the historical and the nonhistorical approach to linguistic phenomena.

Kruszewski's career at the University of Kazan lasted little more than five years – by 1883 when Baudouin had left for Dorpat (now Tartu, Estonia) and he himself had moved up to the highest rung of the academic ladder, his mental illness and physical problems had caught up with him. It was left to Baudouin, his former student Aleksandr I. Aleksandrov, and Friedrich Techmer, editor of the *Internationale Zeitschrift für Allgemeine Sprachwissenschaft*, to complete the German translation of his main work and see it through the press (Kruszewski, 1884–1890). The 1995 translation of his major writings in linguistic theory should ensure recognition of his legacy.

Kuiper, Franciscus Bernardus Jacobus (1907–2003)

J-L Chevillard, CNRS, Université Paris 7, Paris, France

Franciscus Bernardus Jacobus Kuiper was born on July 7, 1907 in the Netherlands. He studied Latin, Greek, and Sanskrit at the University of Leiden. He also took private lessons from the Vedic scholar W. Caland at Utrecht. After completing his dissertation in 1934, Kuiper was high school teacher of Latin and Greek in Indonesia, where he also started to learn Tamil with a native speaker. In 1939, he was appointed professor of Sanskrit at Leiden University, where he taught Sanskrit, Prakrit, and Indo–European linguistics until his retirement in 1972. During World War II, while the university was closed, he deepened his knowledge of Tamil and also studied Munda languages. A recurrent topic in his work is the interaction in a linguistic area between languages belonging to different families, as in his *Proto-Munda words in Sanskrit* (1948) or his 'The Genesis of a Linguistic

among the 'mainstreamers' of his day (cf. Koerner, 1986: 380–381, 382–384); it required the reappraisal of his work by Roman Jakobson (1969; *see* **Jakobson, Roman (1896–1982)**) and others to give due recognition to his contribution to the field. Saussure was familiar with Kruszewski's writings, especially those that had appeared in German translation (1881: 1884–1890), and it is there that he could have found a number of ideas that are now familiar from Saussure's *Cours*. Külpe, Oswald (1862–1915)

D Samain, Université Paris 7, Paris, France

Oswald Külpe was a German philosopher and psychologist who was born in Candau (Latvia) on March 9, 1862, and died in Munich on December 30, 1915. After studying history in Leipzig (1881), where he took an interest in philosophy and psychology, Külpe wandered to Berlin (1882–1884), Göttingen (1884–1885), and Dorpat (nowadays Tartu, Estonia) (1885–1886) before finally returning in 1886 to Wundt's seminar in Leipzig, where he became Wundt's assistant. After his dissertation (1887) and his *Habilitation* (1888), Külpe was made a Privatdozent with teaching responsibilities in psychology. In 1894, he was made the chair of philosophy and aesthetics at the University of Würzburg, where he founded the Institute of Psychology together with Karl Marbe (1896). His career in Würzburg lasted until 1909, when he became professor of philosophy in Bonn. He finally left for Munich in 1913, where he died of influenza contracted while visiting wounded German soldiers.

Area' (1967), further discussed in Hock (1982), in which he proposes that the Sanskrit quotative, marked by *iti*, owes its origin to Dravidian influence. He also worked on mythology (see Kuiper, 1983) and on theater (see Kuiper, 1979). Külpe, Oswald (1862–1915)

D Samain, Université Paris 7, Paris, France

Oswald Külpe was a German philosopher and psychologist who was born in Candau (Latvia) on March 9, 1862, and died in Munich on December 30, 1915. After studying history in Leipzig (1881), where he took an interest in philosophy and psychology, Külpe wandered to Berlin (1882–1884), Göttingen (1884–1885), and Dorpat (nowadays Tartu, Estonia) (1885–1886) before finally returning in 1886 to Wundt's seminar in Leipzig, where he became Wundt's assistant. After his dissertation (1887) and his *Habilitation* (1888), Külpe was made a Privatdozent with teaching responsibilities in psychology. In 1894, he was made the chair of philosophy and aesthetics at the University of Würzburg, where he founded the Institute of Psychology together with Karl Marbe (1896). His career in Würzburg lasted until 1909, when he became professor of philosophy in Bonn. He finally left for Munich in 1913, where he died of influenza contracted while visiting wounded German soldiers.

Though Külpe also published on epistemology, logic, and ethics, he is best known as the leading figure of the Würzburg School. He had many prominent researchers among his students, notably Karl Bühler. Influenced by Machian positivism, his *Outlines of psychology* (1893) still classified psychology among natural sciences, proposing to widen experimental methods to upper mental processes (judgment, knowledge, understanding), and thus rejecting some of Wundt's main principles (such as sharing between 'immediate' and 'mediate' experience, the concept of 'psychic causality,' and the strict limitation of the experimental field).

The break-off remained on other grounds after 1896, when Külpe began his experiments on 'systematic self-observation,' according to which subjects had to solve cognitive problems but were also asked to describe the psychic processes happening within themselves. This departure from the careful experimental control over introspection advocated by Wundt was first supposed to reveal 'elements' of thinking similar to those of sensation and feeling. However, as no such elements were found, it finally brought about the inverse conclusions that thought processes could not be explained as resulting from associative connections between images alone, that objective meanings could be experienced without being embodied by specific words or symbols, and thus that imageless factors (e.g., in the form of rules) could therefore determine thought processes. Conversely, Külpe's concept of *Bewusstheit* ('awareness') emphasizes the fact that the meanings of abstract words can be discovered in consciousness even when only these words themselves are perceivable entities. Other experiments stressed the influence of predispositions to respond to stimuli in such and such manner. Külpe drew the conclusion that the process of abstraction depends not only on the material presented to sensation but also on apprehension by the subject, hence abandoning the sensationalist psychology of contents for a psychology recognizing both contents (*Gedanken*) and acts of mind (*Denken*), close to Husserl and Brentano.

Kunihiro, Tetsuya (b. 1929)

Y Nagashima, Gakushuin University, Tokyo, Japan

Tetsuya Kunihiro was born in the city of Ube, Yamaguchi Prefecture, Japan, on July 23, 1929. He graduated with an M.A. in 1954 from the University of Tokyo and received his D.Litt. in 1979 from the same university. After teaching English at Hagi Senior High School in Yamaguchi Prefecture from 1954–1959, he was appointed lecturer in English linguistics at the University of Shimane in 1959 and associate professor in 1964. In 1967 he moved to the University of Ibaraki and in 1968 to the department

of linguistics at the University of Tokyo, where he became a professor in 1980 and remained until his retirement in 1990 with the title of Emeritus Professor. During this time he became chairman of the department and served as president of the Linguistic Society of Japan (1985–1988). He has been director of the Tokyo Institute for the Advanced Studies of Language since 1995.

His main field of work is descriptive semantics, especially in the field of lexical and grammatical analysis of Japanese and English. His work on the contrastive study of Japanese and English (Kunihiro, 1967) was pioneering in this field, and he has edited five volumes on the same theme (Kunihiro, 1980). He has also compiled an excellent English–Japanese dictionary as chief editor. As a perceptive analyst of word meaning, he has produced with his colleagues, three volumes on the meaning of basic Japanese words.

By developing the theory of sememics, originated by his teacher Shiro Hattori (*see* **Hattori, Shiro (1908–1995)**), he has established his own theory and descriptive method of lexical meaning with an emphasis on the cognitive aspect and the situational context of the speech event.

Kurath, Hans (1891–1992)

M Pierce, University of Michigan, Ann Arbor, MI, USA

Hans Kurath was born on December 13, 1891, in Villach, Austria, and died in Ann Arbor, Michigan, on January 2, 1992. Kurath came to the United States in 1907, becoming an American citizen in 1912. He was educated at the German-American Teachers Seminar in Milwaukee, Wisconsin, and the Universities of Wisconsin, Texas (A.B. 1914), and Chicago (Ph.D. 1920). Kurath taught German at the University of Texas from 1914 to 1916, and from 1917 to 1919, and taught from 1920 to 1927 at Northwestern University. In 1927 he became professor of German and linguistics at Ohio State University, and in 1930 he was named director of the Linguistic Atlas of the United States. He left Ohio State for Brown University in 1931, where he served as professor of Germanics and linguistics, as well as chair of the department of German and the division of modern languages. In 1946, he became professor of English and editor of the Middle English Dictionary (hereafter MED) at the University of Michigan. Kurath was president of the Linguistic Society of America in 1942 and directed the society's summer Linguistic Institutes from 1947 to 1950. He was the recipient of various scholarly honors; he received honorary doctorates from the University of Chicago and the University of Wisconsin at Milwaukee, as well as the University of Michigan Press Book Award in 1972 for the MED (which he shared with his successors as editor). The esteem his students and colleagues held him in is evident from the volume of papers dedicated to him (Scholler and Reidy, 1973). Kurath retired from Michigan in 1962 but remained scholarly active until his death.

Kurath had a major effect on two fields of linguistics: dialectology and lexicography. His dialect work was rigorously based on Neogrammarian ideas about sound change and resembled similar European projects in issues like choice of linguistic consultants. In addition to directing the Linguistic Atlas project, Kurath published numerous groundbreaking works in this area (e.g., Kurath [1972] and Kurath and McDavid [1961]), a number of his fieldworkers later became prominent dialectologists in their own rights, and the data collected under his direction continue to be useful to dialectologists and sociolinguists. His lexicographical work is also substantial. Ironically, given the overwhelmingly positive reception of the MED, there was some resistance to his

of linguistics at the University of Tokyo, where he became a professor in 1980 and remained until his retirement in 1990 with the title of Emeritus Professor. During this time he became chairman of the department and served as president of the Linguistic Society of Japan (1985–1988). He has been director of the Tokyo Institute for the Advanced Studies of Language since 1995.

His main field of work is descriptive semantics, especially in the field of lexical and grammatical analysis of Japanese and English. His work on the contrastive study of Japanese and English (Kunihiro, 1967) was pioneering in this field, and he has edited five volumes on the same theme (Kunihiro, 1980). He has also compiled an excellent English–Japanese dictionary as chief editor. As a perceptive analyst of word meaning, he has produced with his colleagues, three volumes on the meaning of basic Japanese words.

By developing the theory of sememics, originated by his teacher Shiro Hattori (*see* **Hattori, Shiro (1908–1995)**), he has established his own theory and descriptive method of lexical meaning with an emphasis on the cognitive aspect and the situational context of the speech event.

Kurath, Hans (1891–1992)

M Pierce, University of Michigan, Ann Arbor, MI, USA

Hans Kurath was born on December 13, 1891, in Villach, Austria, and died in Ann Arbor, Michigan, on January 2, 1992. Kurath came to the United States in 1907, becoming an American citizen in 1912. He was educated at the German-American Teachers Seminar in Milwaukee, Wisconsin, and the Universities of Wisconsin, Texas (A.B. 1914), and Chicago (Ph.D. 1920). Kurath taught German at the University of Texas from 1914 to 1916, and from 1917 to 1919, and taught from 1920 to 1927 at Northwestern University. In 1927 he became professor of German and linguistics at Ohio State University, and in 1930 he was named director of the Linguistic Atlas of the United States. He left Ohio State for Brown University in 1931, where he served as professor of Germanics and linguistics, as well as chair of the department of German and the division of modern languages. In 1946, he became professor of English and editor of the Middle English Dictionary (hereafter MED) at the University of Michigan. Kurath was president of the Linguistic Society of America in 1942 and directed the society's summer Linguistic Institutes from 1947 to 1950. He was the recipient of various scholarly honors; he received honorary doctorates from the University of Chicago and the University of Wisconsin at Milwaukee, as well as the University of Michigan Press Book Award in 1972 for the MED (which he shared with his successors as editor). The esteem his students and colleagues held him in is evident from the volume of papers dedicated to him (Scholler and Reidy, 1973). Kurath retired from Michigan in 1962 but remained scholarly active until his death.

Kurath had a major effect on two fields of linguistics: dialectology and lexicography. His dialect work was rigorously based on Neogrammarian ideas about sound change and resembled similar European projects in issues like choice of linguistic consultants. In addition to directing the Linguistic Atlas project, Kurath published numerous groundbreaking works in this area (e.g., Kurath [1972] and Kurath and McDavid [1961]), a number of his fieldworkers later became prominent dialectologists in their own rights, and the data collected under his direction continue to be useful to dialectologists and sociolinguists. His lexicographical work is also substantial. Ironically, given the overwhelmingly positive reception of the MED, there was some resistance to his

appointment as director of the project, as he was not trained as a medievalist or as a lexicographer and, in fact, published nothing on medieval subjects except for the MED (Bailey, 1992: 806). However, Kurath was able to overcome this barrier by applying the same rigor to his lexicographic work as he did to his dialectological work, and the results speak for themselves.

Kurdish

P O Skjærvø, Harvard University, Cambridge, MA, USA

The Kurdish language belongs to the Iranian language family. It is spoken mainly in eastern Turkey, Syria, northern Iraq, western Iran, and Central Asia. Today there are large communities of Kurds living in the diaspora, for instance, Germany and Scandinavia. Kurdish is spoken in three main variants: Northern Kurdish, comprising Kurmanji in the west and dialects spoken from Armenia to Kazakhstan; Central Kurdish, spoken in northeastern Iraq (called Sorani) and adjacent areas in Iran (called Kordi or Mokri), as well as in Iranian Kurdistan (called Senne'i); and Southern Kurdish, spoken in Kermanshah province in western Iran (including Lakki and Lori of Posht-e Kuh). Northern and Central Kurdish developed rich literatures from the early 20th century on.

The earliest grammar and vocabulary of Kurdish were prepared by the Catholic missionary Maurizio Garzoni and published in 1787; these were used in subsequent scholarly descriptions of Kurdish. The earliest modern 20th-century studies were those of Oskar Mann and Karl Hadank. The first important post-World War II study, applying modern linguistic methods, was that of D. Neil MacKenzie (1961–1962).

Literary Kurdish in Iraq, Iran, and the former Soviet Union is written in the Arabo-Persian script, but employs a circumflex accent ^ placed above or below letters to mark non-Persian sounds: above *w* and *y* it denotes *majhul* vowels (*ō*, *ē*, contrasting with *ū* and *ī*), above *l* it denotes *ɫ*, and below *r* it denotes the rolled *r* as opposed to the single-flap *r*. Kurdish in the USSR was also written in the Cyrillic script, with the addition of several signs and diacritics. Kurmanji Kurdish is today written in the Latin alphabet with Turkish orthography, thus <c> = ǰ, <ç> = *č*, <ş> = *š*, <j> = *ž*. In addition, a circumflex accent denotes long vowels and an umlaut on <x> denotes the voiced ɣ. In this script, <e> and <a> represent the vowels commonly transcribed as *a* [a > ɛ] and *ā* [aː > *a*ː].

Kurdish belongs to the Central Iranian language group and, as such, has *s*, *z* from **ć*, *ź* (e.g., *āsin* 'iron', but Persian [Farsi] *āhan*; NK *az* 'I', but Old Persian *adam*). Like the Central dialects and, for instance, Parthian, it has -*ž*- from *-*č*-, -*ǰ*- (*rož* ← **raučah* 'day', Persian *ruz*; *dirēž* ← **drāǰah* 'long', Persian *derāz*). It has also retained the Middle Iranian *majhul* vowels *ō*, *ē*, which in Persian have merged with *ū* and *ī*. A rare feature is the development of intervocalic *m* > *v* (including *m* < *hm* < *šm*), which in Northern and Central Kurdish remains distinct from *w*, but in Southern Kurdish merges with it (demonstrative pronouns: NK *av* 'this' ~ *aw* 'that' ← **ima*- ~ **awa*-; CK both *aw* except an area with *am* ~ *aw*; SK *ī* (cf. Persian *īn*) ~ *ow*; NK *čāv*, CK *čāw* 'eye'; CK *awa* ← **ašmā* 'you'). Kurdish shares with Persian the development of **w*- → *b*- (*bā* 'wind' ← **wātah*, Persian *bād*). Northern Kurdish retains final -*t*, which elsewhere becomes *d* or is lost (*dīt* 'saw', Persian *did*).

The Kurdish dialects have very complex phonologies, morphologies, morphophonologies, and syntax, of which no idea can be given in a small space. Proto-Kurdish had two genders, masculine and feminine, two numbers, and two cases, direct and oblique, as well as a vocative. These are preserved in Northern Kurdish, but gradually merge into a no-gender, no-case system as one moves southward (cf. the 1st sing. personal pronoun 'I, me': NK DIR *az* ~ OBL *min*, CK *(a)min*, SK *amin*). All three groups have an indefinite suffix going back to *-*ēk* 'one', while Central and Southern Kurdish have a definite suffix going back

appointment as director of the project, as he was not trained as a medievalist or as a lexicographer and, in fact, published nothing on medieval subjects except for the MED (Bailey, 1992: 806). However, Kurath was able to overcome this barrier by applying the same rigor to his lexicographic work as he did to his dialectological work, and the results speak for themselves.

Kurdish

P O Skjærvø, Harvard University, Cambridge, MA, USA

The Kurdish language belongs to the Iranian language family. It is spoken mainly in eastern Turkey, Syria, northern Iraq, western Iran, and Central Asia. Today there are large communities of Kurds living in the diaspora, for instance, Germany and Scandinavia. Kurdish is spoken in three main variants: Northern Kurdish, comprising Kurmanji in the west and dialects spoken from Armenia to Kazakhstan; Central Kurdish, spoken in northeastern Iraq (called Sorani) and adjacent areas in Iran (called Kordi or Mokri), as well as in Iranian Kurdistan (called Senne'i); and Southern Kurdish, spoken in Kermanshah province in western Iran (including Lakki and Lori of Posht-e Kuh). Northern and Central Kurdish developed rich literatures from the early 20th century on.

The earliest grammar and vocabulary of Kurdish were prepared by the Catholic missionary Maurizio Garzoni and published in 1787; these were used in subsequent scholarly descriptions of Kurdish. The earliest modern 20th-century studies were those of Oskar Mann and Karl Hadank. The first important post-World War II study, applying modern linguistic methods, was that of D. Neil MacKenzie (1961–1962).

Literary Kurdish in Iraq, Iran, and the former Soviet Union is written in the Arabo-Persian script, but employs a circumflex accent ^ placed above or below letters to mark non-Persian sounds: above *w* and *y* it denotes *majhul* vowels (*ō*, *ē*, contrasting with *ū* and *ī*), above *l* it denotes *ł*, and below *r* it denotes the rolled *r* as opposed to the single-flap *r*. Kurdish in the USSR was also written in the Cyrillic script, with the addition of several signs and diacritics. Kurmanji Kurdish is today written in the Latin alphabet with Turkish orthography, thus <c> = ǰ, <ç> = č, <ş> = š, <j> = ž. In addition, a circumflex accent denotes long vowels and an umlaut on <x> denotes the voiced ɣ. In this script, <e> and <a> represent the vowels commonly transcribed as *a* [a > ɛ] and *ā* [a: > *a*:].

Kurdish belongs to the Central Iranian language group and, as such, has *s*, *z* from **ć*, *ȷ́* (e.g., *āsin* 'iron', but Persian [Farsi] *āhan*; NK *az* 'I', but Old Persian *adam*). Like the Central dialects and, for instance, Parthian, it has *-ž-* from **-č-*, *-ǰ-* (*rož* ← **raučah* 'day', Persian *ruz*; *dirēž* ← **drāǰah* 'long', Persian *derāz*). It has also retained the Middle Iranian *majhul* vowels *ō*, *ē*, which in Persian have merged with *ū* and *ī*. A rare feature is the development of intervocalic *m* > *v* (including *m* < *hm* < *šm*), which in Northern and Central Kurdish remains distinct from *w*, but in Southern Kurdish merges with it (demonstrative pronouns: NK *av* 'this' ~ *aw* 'that' ← **ima-* ~ **awa-*; CK both *aw* except an area with *am* ~ *aw*; SK *ī* (cf. Persian *īn*) ~ *ow*; NK *čāv*, CK *čāw* 'eye'; CK *awa* ← **ašmā* 'you'). Kurdish shares with Persian the development of **w-* → *b-* (*bā* 'wind' ← **wātah*, Persian *bād*). Northern Kurdish retains final *-t*, which elsewhere becomes *d* or is lost (*dīt* 'saw', Persian *did*).

The Kurdish dialects have very complex phonologies, morphologies, morphophonologies, and syntax, of which no idea can be given in a small space. Proto-Kurdish had two genders, masculine and feminine, two numbers, and two cases, direct and oblique, as well as a vocative. These are preserved in Northern Kurdish, but gradually merge into a no-gender, no-case system as one moves southward (cf. the 1st sing. personal pronoun 'I, me': NK DIR *az* ~ OBL *min*, CK *(a)min*, SK *amin*). All three groups have an indefinite suffix going back to **-ēk* 'one', while Central and Southern Kurdish have a definite suffix going back

to *-*aka* (-*ak*). The 3rd singular enclitic pronoun is -*ī*, pl. -*yān* (cf. Persian -*eš*, -*ešān*). The 1st and 2nd plural enclitic pronouns are archaic: 1PL -*n*, 2PL -*ū* (beside -*mān* and -*tān*), which go back to Old Iranian **nah* and **wah*. The ezafe has two genders and two numbers, but is simplified according to the general tendency.

The verbal systems are of the typical modern Iranian type, with a three-stem system: present-imperfect, past, and perfect, as well as a split ergative. The present and imperfect take the prefixes NK *t-/di-*, CK *a-/da-*, SK *a-/mi-* (cf. Persian *mi-*) to express progressive tense. Present forms without a prefix or with the prefix *bi-* are subjunctive. The past tenses are ergativic, but only Northern Kurdish has the pure passive type construction (1).

(1) ta az nās kir-im
you.SING.OBL I.DIR familiar do.PAST-1ST.SING
'you knew me'

In Central and Southern Kurdish, where there is no case distinction, the agent is expressed by enclitic pronouns. If the verb has a preverb, the enclitic pronouns come after it (2), otherwise they come between the verb stem and the ending (3).

(2) a-t xwārd
PROG-you.AGT eat.PAST[-3SG]
'you were eating'

(3) nārd-it-īn
send.PAST-you.AGENT-COP.1PL
'you sent us'

Note constructions of the type in (4), where the apposition *pēwa* 'about' governs the person implicit in the copula -*īt* 'you are'; (5), where 'to' governs the pronoun implicit in the copula -*n*- 'you are'; and (6), where 'to' governs the pronoun implicit in the copula -*m*- 'I am'.

(4) xaw-im pēwa dīw-īt
dream-1SG.ENCL about see.PAST-COP.2SG
'I dreamed about you'

(5) dā-m-ī-n-ē
give.PAST-COP.1SG-he.ENCL.OBL-cop.2PL-to
'he gave me to you'

(6) kitēb-ek-ān-it dā-m-ē
book-DEF-PLUR-you.AGT give.PAST-COP.1SG-to
'you gave me the books'

In Northern Kurdish, the passive is formed with the auxiliary *hāt*-'come' + INF (7).

(7) hāt-iye girt-in
come.PERF[-3SG] seize.PAST.INF
'has been seized'

Central and Southern Kurdish have passive formations in present *rē-* or *yē-*, past-*rā-* or -*yā-* (*kuž-yā-* 'be killed'; *de-nūs-rē* [PROG-write.PRES-PASS.PRES. [-3SG]] 'it is being written').

Derivational nominal suffixes are common, as are a variety of types of compound. The meaning of verbs can be modified by preverbs, of which there are many, or the postverb -*ava-/-awa* (-*āw*), unique to Kurdish among Iranian dialects (*hāt-in* [come.INF] 'to come', but *hāt-in-āw* 'to come back, return'. Verbal idioms consisting of adjectives or nouns plus verbs are common, as in all Iranian languages.

Kurukh

P S Subrahmanyam, Annamalai University, Bangalore, India

Introduction

Kuṛux is one of the tribal languages of the Dravidian family with a population of about 1.5 million; thus it is next only to Gondi within the family in terms of number of speakers. The name of the language is spelt also as Kurukh; another name, Oraon, was also in use in earlier times. The main concentration of Kuṛux speakers is found in Chota Nagpur and Bhagalpur districts of Bihar, India; some of them live also in Madhya Pradesh (Raygarh and Sarguja districts) and Orissa (Sundargarh and Sambalpur districts). Some have migrated in recent times to the tea districts of Assam and Nepal and are known there as Dhāngar/Dhangar 'men who receive dhān "rice" as wages'. It belongs to the North Dravidian subgroup along with Malto, its closest ally, and Brahui.

Phonology

Kuṛux contains the ten-vowel system that is normally found in the Dravidian languages (see Table 1); there are also a few words with nasalized vowels, e.g., *khẽ:sō* 'blood'. Its consonant system is presented in Table 2. The velar voiceless fricative (x) and the glottal stop (ʔ) are the peculiar features of Kuṛux phonology, e.g., *xay* 'wife', *ciʔinā* 'to give'.

Syntax

Word Classes

The following word classes may be recognized for Kuṛux: nouns (including pronouns and numerals), verbs, adjectives, adverbs (including expressives), particles, and interjections.

The class of adjectives is a small one. An adjective occurs before the noun it qualifies. Most of the nouns can function as adjectives, for example:

mechā partā
high, height *mountain*
'high mountain'

The adjectives derived from the three deictic bases (see 'Pronouns') show agreement for number (but not for gender) with the noun that follows. Thus, *ā* 'that', *ī* 'this' and *ū* 'that at a greater distance' are used with a singular noun, e.g., *ā/ī/ū ālas* 'that/this/that (extra-dist.) man'. The corresponding forms used with a plural noun are *abṛā*, *ibṛā*, and *hubṛā*, e.g., *abṛā/ibṛā/hubṛā āl-ar* 'those/these/those (extra-dist.) men'. (For verbal adjectives, see 'Nonfinite Verbs').

An adverb occurs before the verb, for example:

ād xanem xanem bar-ckī raʔī
she again again come-past was
'She came frequently.'

Adverbs may be divided into those of (a) time (e.g., *cērō* 'yesterday', *innā* 'today', *nēlā* 'tomorrow'), (b) place (e.g., *mund* 'before, in front', *iyā* 'here', *ayā* 'there', *eksan* 'where'), and (c) manner (e.g., *baggī/baggū* 'much', *oṇṭā oṇṭā* 'separately, one by one', *dav/davdim* 'well').

The particle of emphasis is a good example for particles. It is +*m/im/am/em*, e.g., *nēla+m* 'tomorrow itself' (: *nēlā* 'tomorrow'), *ēn-im* 'even I', *ār-im* 'even they'.

Examples for interjections include: *haʔī* 'yes', *mal/malʔā/mallā* 'no', *anti(jē)* 'of course'.

Word Order

The favored word order in Kuṛux is S(ubject) O(bject) V(erb):

ās eŋg-āgē mandar ci-c-as
he I-DAT medicine give-PAST-3M.SG
'He gave me medicine.'

Table 1 Vowels of Kuṛux

	Front		*Central*		*Back*	
	Short	*Long*	*Short*	*Long*	*Short*	*Long*
High	i	ī			u	ū
Mid	e	ē			o	ōō
Low			a	ā		

Table 2 Consonants of Kuṛux

	L	*D*	*R*	*P*	*Vel*	*G*
Stop						
VL	p	t	ṭ	c	k	ʔ
VLA	ph	th	ṭh	ch	kh	
VD	b	d	ḍ	j	g	
VA	bh	dh	ḍh	jh	gh	
Nasal	m	n			ŋ	
Fricative		s			x	h
Lateral		l				
Trill		r				
Flap			ṛ			
Semivowel	w			y		

(Abbreviations: D = dental, G = glottal, L = labial, P = palatal, R = retroflex, VD = voiced (unaspirated), VA = voiced aspirated, Vel = velar, VL = voiceless (unaspirated), VLA = voiceless aspirated.)

Gender and Number

Kuṛux shows a two-way distinction in gender but the classification differs in the singular and the plural; the feminine goes with the nonhuman in the singular but with the masculine in the plural, as illustrated by the following pronouns:

ās
'he'
ād
'she, it'
ār
'they (human)'
abṛā
'they (nonhuman)'.

Agreement

The finite verb shows agreement with the subject pronoun (or a corresponding noun in the case of the third person) by a change in the personal suffix (the final morpheme in the forms shown in Table 3). In equational sentences, the predicate noun shows agreement with the subject pronoun by taking the same personal suffixes as the finite verb (except 3rd non-m. sg./non-hum. pl. [see 'Finite Verbs']). The use of the copular verb (*tal-* 'to be') in such sentences is optional. Kuṛux partially preserves the old Dravidian feature of the absence of the copular verb:

ēn kuṛux-an (tal-d-an)
I Kuṛux-1sg (be-pres-1sg)
'I am a Kuṛux (speaker).'
ēm kuṛux-am (tal-d-am)
we (excl.) Kuṛux-1pl.excl (be-pres-1pl.excl)
'We (excl.) are Kuṛux (speakers).'

For agreement between the demonstrative adjectives and the nouns qualified with regard to number, see 'Word Classes.'

Table 3 The finite forms of ijʔ- 'to stand'

	Pronoun	*Past tense*	*Present tense*	*Future tense*
1sg.	ēn	ij-k-an	ij-d-an	ijʔ-o-n
1pl. (excl.)	ēm	ij-k-am	ij-d-am	ijʔ-o-m
1pl. (incl.)	nām	ij-k-at	ij-d-at	ijʔ-o-t
2sg.	nīn	ij-k-ay	ij-d-ay	ijʔ-o-y
2sg. (f.)		ij-k-i	ij-d-i	ijʔ-o-y
2pl.	nīm	ij-k-ar	ij-d-ar	ijʔ-o-r
3m.sg	ās	ijj-Ø-as	ij-d-as	ijʔ-o-s
3h.pl.	ār	ijj-Ø-ar	ij-n-ar	ijʔ-o-r
3non-m.sg./ non-h.pl.	abṛā	ijj-Ø-a	ijʔ-i	ijʔ-o-Ø

Noun Morphology

A nominal base is followed by the plural suffix when plurality has to be expressed; the case suffix/postposition occurs at the end. A masculine noun may take the definite suffix *-as*, e.g., *āl* 'man', *āl-as* 'a particular man'.

Plural Suffixes

The plural suffix for the human nouns is *-ar*, e.g., *āl-ar* 'men', *mukk-ar* 'women' (sg. *mukkā*). Some feminine nouns take *-guṭhi-ar*, e.g., *ālī-guṭhi-ar* 'wives'; *-guṭhi (-ar)* is also added optionally to human nouns with *-ar* plural, e.g., *āl-ar(-guṭhi(-ar))* 'men'. Kinship terms, however, take *-baggar*, e.g., *dādā-baggar* 'elder brothers'. The word *xadd-xarrā* 'children' seems to contain another plural suffix *-xarrā*. Nonhuman nouns optionally add *-guṭhī*, which in origin is a separate word meaning 'group', to form the plural, for example:

mūnd aḍḍō(-guṭhī)
three OX-PL
'three oxen'
enḍ man(-guṭhī)
two *tree*-PL
'two trees'.

Case Suffixes and Postpositions

The nominative is unmarked. When a noun is used in the vocative, *-ō/-ay(ō)* is added to it at the end; the vocative form may be preceded by *ē/ana* (but *anay* when a woman is addressed), e.g., *ē/ana urb-ay(ō)* 'O master!', *anay mukk-ay* 'O woman!'. Further, when women talk to women, *anay* is replaced by *ān/anē*, e.g., *ān xay* 'O daughter!', *anē xay-guṭhi-ar-ō* 'O daughters!'.

The accusative suffix is *-an* after a consonant and *-n* after a vowel, e.g., *āl-an* 'man (accus.)', *mukka-n* 'woman (accus.)' (: *mukkā* 'woman') but it is *-in* after the definite suffix *-as* (in masculine nouns, e.g., *āl-as-in* 'the man (accus.)', the plural *-ar* (e.g., *āl-ar-in* 'men (accus.)') and after a demonstrative pronoun that ends in a consonant, e.g., *ād-in* 'her, it (accus.)'.

The instrumental suffix is *-trī/-trū*, e.g., *āl-trī* 'by the man'.

The dative uses the postposition *+gē* (variant *+ā(gē)* after a pronoun), e.g., *āl+gē* 'to the man', *eŋg-ā(gē)* 'to me'.

The ablative suffix is *-tī* after a consonant, *-ntī* after a vowel; after the plural *-ar*, *-tī* freely varies with *-intī*, e.g., *āl-tī* 'from the man', *mukka-ntī* 'from the woman', *āl-ar-tī* /*āl-ar-intī* 'from the men'.

The genitive commonly uses the postposition *+gahi*, e.g., *āl + gahi* 'of the man'; it has the variant

+*hay* after a pronoun, e.g., *eŋg* + *hay* 'my'. However, nouns denoting a place take the suffix *-ntā*, e.g., *padda-ntā* 'of the village' (: *paddā* 'village').
The locative uses the postposition +*nū* (also +*nō* dialectally), e.g., *eṛpā* + *nū* 'in the house'.

Pronouns

Two important features of the pronominal system of Kuṛux are the presence of inclusive and exclusive distinction in the first person pronoun (represented also in the finite verb) and the formation of the third person pronouns on three deictic bases.
The personal pronouns are:

ēn 'I'	ēm 'we (excl.)'
	nām 'we (incl.)'
nīn 'you (sg.)'	nīm 'you (pl.)'

The third person pronouns are formed on the three deictic bases *a-/ā-* (distant), *i-/ī-* (proximate) and *hu-/hū-* (extra-distant):

Distant	Proximate	Extra-distant	
ā-s	ī-s	hū-s	'he'
ā-d	ī-d	hū-d	'she, it'
ā-r	ī-r	hū-r	'they (hum.)'
a-bṛā	i-bṛā	hu-bṛā	'they (non-hum.)'

The reflexive pronouns are *tān* (sg.) and *tām* (pl.).
There are five interrogative pronouns: *nē* 'who', *ēkā* 'who, which', *endr/endrā/ēkdā* 'what, which'. The addition of the particle +*ʔim/ʔam* to an interrogative pronoun converts it into an indefinite pronoun, e.g., *nīk+ʔim* 'someone'.

Numerals

Kuṛux retains the Dravidian numerals only up to 4 and the rest are borrowed from Hindi. The native numerals have also preserved a distinction between nonhuman and human (the variants given in parentheses for the human forms occur before case suffixes and postpositions).

	Nonhuman	Human
'1'	oṇḍ/oṇṭā	ort
'2'	eṇḍ/e:ṇḍ	irb (irbar-)
'3'	mūnd	nub (nubar-)
'4'	nāx	naib (naibar-)

The human numerals are generally followed by the classifier *jhan-ar* 'persons' (sg. *jhan*), for example:

nub	jhan-ar	bar-c-ar
three (h.)	CLASSIF	*come*-PAST-H.PL.

'Three men came.'

The counting is done in terms of 'score' for which the word is *kūrī/bīsoʔe*, *oṇḍ kūrī/bīsoʔe* 'one score', *kūrīeṇḍ* or *eṇḍ bīsoʔe* 'two score', etc. The ordinal is formed by adding *-(an)-tā* to a cardinal, e.g., *eṇḍ-(an)tā* 'second'; however, there is a special word for 'first': *mund-(an)tā*.

Verb Morphology

Female Speech

An important characteristic feature of the Kuṛux verb morphology is the use of special forms by women when they talk among themselves; some of the tense and personal suffixes in women's speech are different from those in men's speech:

(Men's speech)	nīn	ekātarā	kaʔa-d-ay
(Women's speech)	nīn	ekātarā	kaʔa-d-ī
	you (sg.)	*where*	*go*-PRES-2SG

'Where are you (sg.) going?'

Verb Bases

A verb base in Kuṛux may be simple or complex. Four types may be recognized among the complex bases:

1. Intransitives or reflexives derived from transitives by the addition of *-r-*, e.g., *kol-r-* 'to be opened' (: *kol-* 'to open'), *mūjh-r-* 'to wash one's own face' (: *mūjh-* 'to wash another's face').
2. Transitives derived from intransitives by the addition of *-aʔa-*, e.g., *maṛx-aʔa-* 'to make dirty' (: *maṛx-* 'to be dirty').
3. Causatives derived from transitives by the addition of *-tāʔa-*, e.g., *es-tāʔa-* 'to cause to break' (: *ess-*'to break').
4. Reciprocals derived by the addition of *-nakr-* to a simple verb base, e.g., *ēr-nakr-* 'to look at each other' (: *ēr-* 'to see'), *kēb-nakr-* 'to abuse one another' (: *kēb-* 'to abuse').

Finite Verbs

A finite verb has the following structure:

Verb Base + Tense Suffix + Personal Suffix

The personal suffixes are:

1st sg.	-an
1st pl. (excl.)	-am
1st pl. (incl.)	-at
2nd sg.	-ay /(female speech) -i
2nd pl.	-ar
3rd m. sg.	-as
3rd hum. pl.	-ar
3rd non-m. sg./ non-hum. pl.	-a (after past)/ -i (after present)

The vowel of all these suffixes is deleted after the future suffix *-o*. Three tenses, past (suffixes: *-k-*,*-ck-*), present (suffixes: *-d-*, *-n-*) and future (*-o-*) are there (see Table 3).

Unlike its counterpart in the sister languages, the imperative in Kuṛux has only one form without distinction between the singular and the plural. The suffix is *-ā* when men are addressed and *-ay* when women are addressed (when women speak to women, the suffix is *-ē*): *esʔ-ā/-ay/-ē* 'Break!'. A milder sort of the imperative has the suffix *-kē*, e.g., *bar-kē* 'Come (if you please)!'.

Nonfinite Verbs

The infinitive, which can also function as a noun and an adjective, has the suffix *-nā* (also *-ā* in certain constructions), e.g., *es-nā/esʔ-ā* 'to break, breaking'.

The present participle has the suffix *-nū(tī)/-num*, e.g., *es-nū(tī)/es-num* 'breaking'.

The past participle has the suffix *-ār*, e.g., *esʔ-ār* 'having broken'.

There are three types of adjectives derived from verb bases:

- The infinitive with adjectival function:

kūr-nā	amm
burning	*water*

'hot water'

- Past adjective with the suffix *-ckā*:

ke-ckā	āl-ar
die-PAST ADJ	*man-PL*

'dead people'

- Agent noun (see *Agent Noun*) functioning as nonpast adjective:

pāṛ-ū/ pāṛ-nā	pellō
sing-NON-PAST.ADJ	*girl*

'singing girl'

Agent Noun

The agent noun, with the suffix *-ū* can also take the masculine and the plural suffixes, e.g., (from *esʔ-* 'to break')

isʔ-ū	'one who/which breaks'
isʔ-u-s	'a man who breaks'
isʔ-u-r	'persons who break'

Negative Verb

Kuṛux employs the verb base *mal-* 'to be not' in the present tense (with *-y-* and *-k-* as optional variants of the regular present suffixes *-d-/-n-* [see Table 3]) as the negative verb to deny the identity of the subject and the predicate noun phrases, for example:

ēn	bēl-an	mal-d-an/mal-y-an/mal-k-an
I	*king-1SG*	*not.be-PRES-1SG*

'I am not a king.'

Kuryłowicz, Jerzy (1895–1978)

R D Greenberg, Yale University, New Haven, CT, USA

Jerzy Kuryłowicz was born in the city of Stanislau in 1895, which at that time was part of the Austro–Hungarian Empire, and is now known as Ivano–Frankivs'k in Ukraine. He studied foreign languages while he was both a secondary school student and while studying for his first university degree in Vienna. His university studies were interrupted by the outbreak of World War I, when Kuryłowicz was drafted for military service. He was injured in the war and spent some time recovering from his injuries in a Russian hospital, where he is said to have perfected his knowledge of Russian; he also became interested in language loss among aphasia patients. In 1920, he pursued graduate studies in Romance and Germanic

Unlike its counterpart in the sister languages, the imperative in Kuṛux has only one form without distinction between the singular and the plural. The suffix is *-ā* when men are addressed and *-ay* when women are addressed (when women speak to women, the suffix is *-ē*): *esʔ-ā/-ay/-ē* ‘Break!’. A milder sort of the imperative has the suffix *-kē*, e.g., *bar-kē* ‘Come (if you please)!’.

Kuryłowicz, Jerzy (1895–1978)

R D Greenberg, Yale University, New Haven, CT, USA

Jerzy Kuryłowicz was born in the city of Stanislau in 1895, which at that time was part of the Austro–Hungarian Empire, and is now known as Ivano–Frankivs’k in Ukraine. He studied foreign languages while he was both a secondary school student and while studying for his first university degree in Vienna. His university studies were interrupted by the outbreak of World War I, when Kuryłowicz was drafted for military service. He was injured in the war and spent some time recovering from his injuries in a Russian hospital, where he is said to have perfected his knowledge of Russian; he also became interested in language loss among aphasia patients. In 1920, he pursued graduate studies in Romance and Germanic

philology at the Jan Kazimierz University in Lvov. At that time he also became interested in Indic studies under the tutelage of Andrzej Gawronski, and in Semitic studies with Zygmunt Smogorzewski and Mojzesz Schorr.

He completed his doctorate within three years, and thereafter traveled to Paris on a scholarship from the French government to continue his studies in Romance linguistics. In Paris he attended lectures of the eminent Indo–Europeanist, Antoine Meillet, and under Meillet's influence, Kuryłowicz shifted his main interests from Romance linguistics to comparative Indo–European. In this period, he analyzed the Cuneiform Hittite texts, and through these texts was able to confirm Saussure's 1879 postulations regarding Indo–European laryngeals. This discovery sparked further interest in the study of Indo–European phonology. For his postdoctoral studies in France, Kuryłowicz received a diploma from the *Ecole Pratique des Hautes Etudes*.

Kuryłowicz returned to Poland in 1928 to take up a professorial post at the Jan Kazimierz University of Lvov. In the 1930s, he regularly presented at scholarly linguistic conferences in Europe, and in 1931 received a Rockefeller scholarship, which took him for an academic year to Yale University in the United States. That same year, he was elected a corresponding member of the Polish Academy of Arts and Sciences, and he became a full member of the Academy in 1938. He spent World War II in Lvov during both the Soviet and Nazi occupations. After the war, Lvov became part of the USSR, and Kuryłowicz moved to the devastated city of Wrocław (Breslau before the war) in 1946, where he became a professor at the University of Wrocław. In 1948, he was appointed a professor at the Jagiellonian University in Cracow, where a chair of general linguistics was created for him. He remained in this post until his retirement in 1965.

In his first eight years in Cracow, the entire Polish educational system came under severe pressure due to Stalinization. Departments of English and other west European languages were abolished, and scholars were prohibited from maintaining contacts with or traveling to the West. Nevertheless, this period proved to be a highly productive one for Kuryłowicz. After travel restrictions were relaxed in 1956, Kuryłowicz worked to reestablish departments of English and other Western languages, and rebuilt strong links with linguists in western Europe and the United States. He received several honorary doctorates in the 1960s and 1970s and was a visiting professor at both Harvard University and the Massachusetts Institute of Technology. In 1964, he organized a symposium at the Jagiellonian University in Cracow in honor of the institution's 600th anniversary. The symposium was dedicated to the 'Notion of law in linguistics'; his own paper focused on the laws of isomorphisms. Kuryłowicz remained an active scholar until his death in 1978; he wrote 4 books in retirement and approximately 80 scholarly articles.

Kuryłowicz was a prolific scholar, and his works covered topics in Indo–European, Germanic, Romance, Semitic, and Slavic linguistics, as well as general linguistics. In his early works, he accepted principles of structural linguistics in his analysis of diachronic linguistic material, and he was an admirer of the work of the Prague linguistic circle. In 1948, he brought such a structurally oriented theory of language to Cracow, inspiring a generation of students there, and making Cracow the strongest center for linguistics in Poland. In the interwar period, Kuryłowicz made significant contributions to the study of Indo-European through his work on the Hittite texts. He published his first monograph in 1935, *Etudes indoeuropéennes* ('Indo–European studies'). After World War II, he focused on the accentuation of Indo–European languages and the issue of apophony (ablaut) in Indo–European languages. He became particularly interested in the subject of linguistic analogy in the historical development of languages, and elaborated upon what he considered to be a series of laws for linguistic analogy. In the 1960s, he gained inspiration through his contacts with Roman Jakobson and Morris Halle, who sparked his interest in the subject of inflectional categories. After his retirement, he strove to produce a definitive Indo–European grammar in cooperation with some other linguists. He produced one volume in this series, focusing on Indo–European accentuation and ablaut (1968).

Kuwait: Language Situation

Editorial Team

On the northwestern coast of the Persian Gulf, Kuwait shares borders with Iraq and Saudi Arabia. Kuwait's modern history began in the early 18th century, when several clans from the Al Aniza tribe migrated to the northern shore of the Gulf from the Najd, their famine-stricken homeland in central Arabia. Eventually, the Al Sabah emerged as the dominant clan, and its members were formally established as rulers in 1756. By the late 19th century, however, fears of growing Ottoman influence led Sheikh Mubarak Al Sabah to enter into an agreement with Great Britain, which effectively established Kuwait as an autonomous British protectorate. Under the 1899 agreement, Kuwait maintained control over its internal affairs, and Great Britain assumed responsibility for the country's security and foreign relations. By the 1960s, Kuwait enjoyed such a level of economic development that it became one of the wealthiest states on a per capita basis, and in 1961 Kuwait gained full independence from Britain. For a brief period, between 1990 and 1991, Kuwait was under Iraqi control, but the Iraqi army was defeated by United Nation forces.

The official national language of Kuwait is Standard Arabic, a modernized variety of Classical Arabic. The latter, with its archaic vocabulary, is used for religious and ceremonial purposes, whereas Standard Arabic is employed in formal situations, for education, and for official purposes and is the language of the press. In the Arabic-speaking world, only the well educated have adequate proficiency in Standard Arabic; in Kuwait, the literacy rate among men is 85.1% and among women is 81.7%. About 85% of the population uses Gulf Spoken Arabic to communicate. Mehri, a South Arabian language, is used by some 3530 Kuwaitis. In addition, English is widely spoken, and both television and radio broadcasts are often in English. There is one institution in Kuwait for all its 110 285 deaf inhabitants.

About 85% of the population uses Gulf Spoken Arabic to communicate. Mehri, a South Arabian language, is used by some 3530 Kuwaitis. In addition, English is widely spoken, and both television and radio broadcasts are often in English. There is one institution in Kuwait for all its 110 285 deaf inhabitants.

Kwa Languages

M E K Dakubu, University of Ghana, Accra, Ghana

The Kwa languages, a branch of the Niger-Congo family, are spoken in West Africa. As presently defined, the group extends from southeastern Ivory Coast in the west through the southern two-thirds of Ghana, southern Togo, and the Republic of Benin to the Benin-Nigeria border in the east. The term Kwa was adopted by linguists toward the end of the 19th century to group together Akan, Ga, Ewe (Éwé), and their close relatives because in many of these languages a stem *kwa* or *kua* means 'man' or 'person.'

Constitution of the Group

The list of languages included in Kwa has varied considerably. In the 1950s, Westermann and Bryan included 10 languages of Ivory Coast that they subgrouped into the Lagoon group; Akan, including the languages more recently termed Tano; Ga-Dangme; Ewe; and most of the languages of southern Nigeria. Greenberg's 1963 classification expanded the group to include the Kru languages of Liberia in the east, the languages of the Ghana-Togo hill country that Westermann and Bryan had explicitly excluded, and the Ijaw languages of the Niger delta. This membership was maintained by Stewart in 1971, but in 1989 he eliminated the Kru languages and the Nigerian languages, keeping the Togo Mountain languages and adding a few languages hitherto unknown or unstudied. This is the membership in the most recent overview presented by Williamson and Blench (2000), which essentially has contracted back to the earliest membership plus the Lagoon and the Togo Mountain languages. The group as most recently defined, without Kru and without the Nigerian languages, is sometimes referred to as New Kwa.

Nevertheless, the Kwa languages are currently considered to be more closely related to Yoruba, Igbo, and other languages of southern Nigeria than to the rest of Niger-Congo, forming with them a branch of the Volta-Congo subgroup of Niger-Congo. However, except at the lower levels of classification such as the Tano, Potou-Tano, and Ewe-Fon (Gbe) groups, genetic relationships among these languages are quite distant. It has never been adequately demonstrated using the comparative method that Akan, Ga, Ewe, and the Togo Mountain languages are more closely related to one another than to any other languages.

The Subgroups

The (New) Kwa subgroups are distributed approximately from east to west along the coastal forest and savannah, with the majority of languages and speakers in Ghana. However, many communities have traditions of migration, and it is likely that 1500 years ago their geographical distribution was very different from today. A primary distinction has sometimes been made between the western languages with Ga-Dangme and some of the Togo Mountain languages, referred to as 'Nyo,' and Gbe and the other Togo Mountain languages, referred to as 'Left Bank' (of the Volta River). We examine the composition of the subgroups starting in the west and moving eastward.

The Lagoon languages of the Ivory Coast – Avikam and Alladian, Adjukru (Adioukru), Abidji, Abbey (Abé), Attié, and an isolated language farther west called Ega – are not particularly closely related to one another. Just east of these, the Potou-Tano group comprises at least 20 languages, including Ebrie (Ebrié) and Mbatto (Mbato) (the Potou of Potou-Tano) and the Tano group consisting of Krobu, Abure, and Eotilé (Beti) (all spoken in the Ivory Coast); Nzema, Ahanta, Anyi (Anyin), and Baule (Baoule) (spoken in the eastern Ivory Coast and western Ghana); Anufo (spoken in northeastern Ghana); Akan (with by far the most speakers, mainly in Ghana); and approximately a dozen languages making up the Guang group including Gonja, Nawuri, Nchumuru (Nchumbulu), Krachi (Krache), Nkonya, Okere (Cherepon), Larteh, Efutu, and Awutu (all spoken in Ghana from north of Akan to the sea in the south, distributed along the course of the Volta river). Because the locus of greatest differentiation is in the west, it has been suggested that the Potou-Tano languages spread from west to east. Migration traditions suggest that they also spread in the eastern area (i.e., mainly in Ghana) from north to south.

Ga-Dangme, on the other hand, consists of just two languages, Ga and Dangme (or Adangme). Now situated on the Accra Plain south east of the Tano languages and west of the Volta River, the speakers have traditions of migration from the east, possibly in conjunction with the Ewe, and from the northeast, probably from what is now the northern Republic of Benin.

The Central Togo or Togo Mountain languages comprise 14 languages spoken in Ghana, Togo, and the Republic of Benin, most of them in the hilly area on the Ghana-Togo border. An earlier name for these languages was Togo Remnant Languages, adapted from the German *Togorestsprachen*. That name reflected the possibility that their fragmented distribution on hilltops difficult to access and their generally small numbers of speakers result from these linguistic communities having fled to refuge areas at some time in the past, under pressure from expanding larger groups such as (perhaps) the Ewe and the Akan. True or not, the name is disliked by speakers and no longer used.

Heine (1968) treated the languages as a genetic family and classified them into two subgroups: the NA subgroup (Basila (Anii), Lelemi-Lefana (Lelemi), Logba, Adele, Likpe (Sekpele), Santrokofi (Sele), and Akpafu-Lolobi (Siwu)) and the KA subgroup (Avatime, Nyangbo-Tafi, Bowiri (Tuwili), Ahlo, Kposo (Akposo), Kebu (Akebou), and Animere). More recent classifications accept these two groupings, but

put them directly under Kwa; that is, they are now considered no more closely related to one another than to the other New Kwa groups, and 'Togo Mountain' or 'Central Togo languages' are merely geographical labels.

Kposo has the most speakers by a considerable margin, approximately 80 000, followed by Kebu with 17 500. (Both are spoken mainly in Togo; figures are based on Heine, 1968.) Lelemi-Lefana has approximately 15 000 speakers and Adele approximately 8000. Others have fewer: Logba reportedly has approximately 2000 speakers, and Animere was said to have fewer than 300 in the 1960s. There is evidence that one or two languages have died out in the area in the course of the past 2 centuries.

The area extending approximately 80 miles inland along the coast from the Volta eastward to the Nigerian border is dominated by the closely knit Gbe group of languages and dialects. The name is adopted from their common word for 'language'. They include Ewe, spoken in Ghana and Togo by more than 3 million people. The Ewe-speaking people have a tradition of migration from farther east but still within the Gbe area, from Nuatja and Tado in southern Togo. Gen (Gen-gbe) is the language of Lomé, the capital of Togo and a major lingua franca. Another major variety is Aja (Aja-gbe). Somewhat more distantly related are Maxi (Maxi-gbe) and Fon (Fon-gbe), the language of the old kingdom of Dahomey, which is now part of the Republic of Benin. The easternmost variety is Gun (Gun-gbe), which crosses the Nigerian border along the coast and is thought to have been spoken in the Lagos area in earlier times.

Linguistic Characteristics

In all Kwa languages, the fundamental word order is subject-verb-object. It was once thought that they typically had very simple morphology, but, although the situation varies among the different groups, this is generally not really the case. Part of the reason for this belief may have been the fact that in many of the languages tone plays an important role in morphology, with some grammatical morphemes being realized only by tone. Thus, in the following Ga sentence only the high tone on the second syllable of the pronoun *amɛ* 'they' shows that the verb is perfect and not aorist.

amɛ́-bá
'they have come'
they.PERF-come

Tone is also important in making lexical distinctions; again in Ga, we have *lá* 'blood' with high tone but *là* 'fire' with low. The number of phonemic tones ranges from the minimal two in Ga and Akan to five in Avatime. In all the languages west of the Volta, tone levels are affected by downstepping, or the lowering of all pitch levels after a low tone throughout a sentence, but many languages east of the Volta, including Ewe, do not have this.

Cross-height vowel harmony, based on the position of the tongue root, is typical of the Tano languages but not of Ga-Dangme, Gbe, or some of the Togo Mountain languages. In all (Adjukru is an exception), syllables are typically open, ending in a vowel or sometimes a syllabic consonant.

Double articulated consonants ([*k͡p*], less often [*g͡b*]) are typical of Ga-Dangme, the Togo Mountain languages, and Gbe but not of Akan and some other Potou-Tano languages. In Ga-Dangme and Gbe (and also Yoruba), but again not in the western languages, the voiceless bilabial stop /p/ did not exist until it was introduced through loanwords in the course of the 18th century. Consonant clusters either do not exist or the second consonant is limited to off-glides and /l/ or /r/ and the cluster is analyzable as being derived from a CVV or CVCV structure.

Verb systems vary, but paradigms generally express aspect features, with the perfective-imperfective distinction basic. Grammatical tense is less important, often limited to a contrast between future and nonfuture, and even that shows signs of having been grammaticized relatively recently in many languages. The expression of progressive aspect is of particular interest because the western languages differ radically in its expression from many of those spoken east of the Volta. In Tano languages and also in Ga, the progressive (like most other aspect features) is shown by a prefix, as in the following sentences in Akan (1) and Ga (2).

(1) abofra no re-di nneɛma
child the PROG-eat things
'the child is eating something'

(2) gbekɛ lɛ mii-ye nii
child the PROG-eat things
'the child is eating something'

In Ewe (3) and Dangme (4), on the other hand, it is periphrastically expressed, with an aspect verb followed by a nonfinite form of the event verb preceded by its object.

(3) Ɖevi a le nu ɖu-m
child the is thing eat-PROG
'the child is eating (something)'

(4) jukwɛ ɔ ŋɛ nɔ ye-e
child the is thing eat-PROG
'the child is eating (something)'

Some of the Togo Mountain languages use the periphrastic style of expression, but many do not.

In Kwa languages, the noun is followed by the adjective, article, and so on that modify it, whereas a possessor precedes the possessed noun. However, there are radical differences in nominal morphology. The Togo Mountain languages generally have several singular and plural classes expressed by prefixes; modifiers take prefixes that show agreement (concord) with the class of the noun they modify and pronouns also vary according to the class of the noun referred to. Akan and other Tano languages have several singular and plural prefixes for nouns but no class concord. Ga-Dangme, however, uses basically just one plural (no singular) suffix, whereas the Gbe languages use a phrase-final particle, as in the following example from Fon.

(5) xɔ̀ntɔ̀n yétɔ̀n wè lɛ́
friend your 2 PL
'both your friends'

Serial verb constructions, in which several verbs share one subject and sometimes object with no intervening conjunction, occur in all Kwa languages.

Kyrgyzstan: Language Situation

L Johanson, Mainz University, Mainz, Germany

Languages

Kyrgyzstan is a Central Asian country (capital: Bishkek, until 1990 named Frunze), bordering on China, Uzbekistan, Tajikistan, and Kazakhstan. It was annexed by Russia in the late 19th century, became a Soviet Socialist Republic in 1936, and achieved independence from the Soviet Union in 1991. Its official languages are Kirghiz and Russian.

The population is mainly concentrated to the lowlands of the Chu and Talas Valleys and the Kirghiz part of the Ferghana Valley. According to the 1999 census, the main linguistic groups among the roughly 5 million inhabitants are Kirghiz (64.9%), Uzbeks (13.8%), and Russians (12.5%). The rest is composed of speakers of numerous other languages. The seemingly weak position of the Uyghurs, who make up 1% of the population, is partly due to their tendency to refer to themselves as Uzbek.

The Ferghana Valley, located on Upper Syrdarya, is divided between Kyrgyzstan, Uzbekistan, and Tajikistan. As a result of the administrative division set up in the Stalin era, the borders of the three countries do not follow the borders of the speech communities. The valley has remained a matter of dispute between the countries. The part of the valley that belongs to Kyrgyzstan, even its main city Osh, has a predominantly Uzbek population. Many speakers of Kirghiz live on Uzbek and Tajik territories. Two enclaves in Uzbekistan and one in Tajikistan belong to Kyrgyzstan, whereas several small Uzbek enclaves exist in Kyrgyzstan. In 1992–1993, refugees from Tajikistan moved into southern Kyrgyzstan.

Some of the Togo Mountain languages use the periphrastic style of expression, but many do not.

In Kwa languages, the noun is followed by the adjective, article, and so on that modify it, whereas a possessor precedes the possessed noun. However, there are radical differences in nominal morphology. The Togo Mountain languages generally have several singular and plural classes expressed by prefixes; modifiers take prefixes that show agreement (concord) with the class of the noun they modify and pronouns also vary according to the class of the noun referred to. Akan and other Tano languages have several singular and plural prefixes for nouns but no class concord. Ga-Dangme, however, uses basically just one plural (no singular) suffix, whereas the Gbe languages use a phrase-final particle, as in the following example from Fon.

(5)	xɔ̀ntɔ̀n	yétɔ̀n	wè	lɛ́
	friend	your	2	PL
	'both your friends'			

Serial verb constructions, in which several verbs share one subject and sometimes object with no intervening conjunction, occur in all Kwa languages.

Kyrgyzstan: Language Situation

L Johanson, Mainz University, Mainz, Germany

Languages

Kyrgyzstan is a Central Asian country (capital: Bishkek, until 1990 named Frunze), bordering on China, Uzbekistan, Tajikistan, and Kazakhstan. It was annexed by Russia in the late 19th century, became a Soviet Socialist Republic in 1936, and achieved independence from the Soviet Union in 1991. Its official languages are Kirghiz and Russian.

The population is mainly concentrated to the lowlands of the Chu and Talas Valleys and the Kirghiz part of the Ferghana Valley. According to the 1999 census, the main linguistic groups among the roughly 5 million inhabitants are Kirghiz (64.9%), Uzbeks (13.8%), and Russians (12.5%). The rest is composed of speakers of numerous other languages. The seemingly weak position of the Uyghurs, who make up 1% of the population, is partly due to their tendency to refer to themselves as Uzbek.

The Ferghana Valley, located on Upper Syrdarya, is divided between Kyrgyzstan, Uzbekistan, and Tajikistan. As a result of the administrative division set up in the Stalin era, the borders of the three countries do not follow the borders of the speech communities. The valley has remained a matter of dispute between the countries. The part of the valley that belongs to Kyrgyzstan, even its main city Osh, has a predominantly Uzbek population. Many speakers of Kirghiz live on Uzbek and Tajik territories. Two enclaves in Uzbekistan and one in Tajikistan belong to Kyrgyzstan, whereas several small Uzbek enclaves exist in Kyrgyzstan. In 1992–1993, refugees from Tajikistan moved into southern Kyrgyzstan.

Language Policy

Kirghiz was established as a standard language in the Soviet period. A written variety was created in 1923. The originally used Arabic script was abandoned for a Roman-based alphabet; a Cyrillic alphabet was adopted in 1940–1941.

In the early 1990s, Kirghiz was introduced as the official language of the independent republic. In 2001, after substantial pressure from Russia, the Russian language became the second official state language alongside Kirghiz.

In the first years of independence, a significant number of non-Kirghiz speakers left the republic. The emigration rate was highest in 1993, but decreased subsequently thanks to measures against discrimination against citizens who did not master Kirghiz. The number of Russians decreased by at least 6%. Practically all speakers of German, who had made up 1% of the population, left the country. On the other hand, the Kirghiz-speaking proportion of the population increased due to immigration from Tajikistan and Uzbekistan.

Though Russian still dominates public life in Kyrgyzstan, e.g., by being the main medium of publication (newspapers, books, etc.), the efforts to protect and promote Kirghiz have been successful. The Kirghiz generally maintain a high degree of mastery of their language. A return to a Roman-based alphabet has been discussed and planned, but not implemented so far.

Holcot, Robert (d. 1349)

E Bell Canon, Social Circle, GA, USA

Robert Holcot (Holkot) was born near Northampton, England c. 1290. Joining the Dominican order, he arrived at Oxford and would remain there as student and then teacher from 1326–1332. Holcot may have served in the capacity of Dominican regent master at Oxford until being called to the post of clerk for Richard de Bury, Bishop of Durham. In 1343, Holcot returned to Northampton and lived in the priory there until his death of the bubonic plague in 1349.

Dominican training at the time of Robert Holcot's education would have likely included the study of logic, grammar, philosophy, and theology. His training on the differences between faith and reason would have followed the teaching of Saint Thomas Aquinas. Holcot himself was more a follower of William of Ockham than of Aquinas. In fact, although not fully agreeing with Ockham on matters of epistemology with regards to intuition and abstraction, Holcot used other fundamental principles from the teachings and writings of Ockham as a basis for his religious philosophy.

Holcot tried to reconcile the impassable differences between logic and faith. Since the principle of noncontradiction is fundamental to a logical progression of thought, it is difficult to reconcile the Christian belief that God is omnipotent within the framework of that logical progression. For instance, 'If God is omnipotent, can God create a rock so big that even God can't move it?' For Holcot, the answer was that natural laws with regard to logic and the limitations of our own human language must not apply to God. There must be, in addition to Aristotelian logic, which is applicable to the natural order, a separate logic of faith that is applicable to God.

Also problematic for the faithful Christian was the notion of future contingents with regard to divine omniscience. In other words, if God knows all things and any contingency is able to either exist or not, God cannot have foreknowledge of something that is inherently contingent. Holcot reconciled this disagreement between the logical and the theological by arguing that (simply put) if God is omniscient, the debate over whether or not he can know the nature of a future contingency is moot.

The written works of Robert Holcot include his comments on Peter Lombard's *Sentences*. Written while at Oxford, Holcot's 'Comments' on the *Sentences* are considered to be his most famous work. His *Sermo finalis*, given at the end of his tenure at Oxford, employs double entendre, or puns, to address his disapproval of his successor. Also of importance, the *Sex articuli* is both a comment on epistemology and a criticism of Holcot's contemporaries. It is possible that the *Sex articuli* was intended to appear together with his comments on the *Sentences*. Other important works include comments on Matthew,

De imputabilitate peccati (On the imputability of sin); *De stellis* (On the Stars), *Moralitates* and *Convertimini; Postilla super librum Sapientiae;* and commentaries on Proverbs, Canticle of Canticles, and Ecclesiasticus.

Holder, William (1616–1698)

C Neis, Universitat Potsdam, Potsdam, Germany

William Holder was born in 1616 in Southwell, Nottinghamshire, England and died on January 24, 1698 in Hertford, England. Holder was a clergyman, mathematician, musician, phonetician, and speech therapist. He was the first Englishman in the 17th century to propose an explicit practical application of an advanced phonetic theory.

Holder began his studies at Pembroke Hall, Cambridge in 1633. He was elected Fellow in 1640, after his graduation. During the Civil War, he moved to Oxford, where he became a doctor of divinity at Oxford University in 1660. In 1663 he was elected to the Royal Society, which recognized his achievements in phonetics and his system of teaching the deaf and mute people. Apart from his phonetic interests, Holder also made important contributions to music theory, especially to the theory of harmony and composition.

From 1659 to 1660, he taught 10-year-old Alexander Popham, who was both deaf and mute, to speak. Holder described this experience in *Philosophical Transactions of the Royal Society* (1668), but his successful language training to Popham soon caused a public quarrel between Holder and John Wallis. Wallis, a mathematician who was a well-known instructor of deaf-mutes, taught Popham after the boy had worked with Holder. Wallis, however, credited himself alone with the successful training of Popham without mentioning Holder's merits. Holder gave his account of the dispute in his *A supplement to the philosophical transactions of July 1670, with some reflexions on Dr. John Wallis, his letter there inserted* (1678).

Holder's work with Popham had a deep impact on his phonetic theory, which he explained in his *Elements of speech: an essay of inquiry into the natural production of letters: with an appendix concerning persons deaf and dumb* (1669). The appendix was a reprint of Holder's report on his work with Popham in *Philosophical transactions*; it may be regarded as the first definitive manual of speech therapy written in England. *Elements* was a particularly valuable piece of English linguistic scholarship in the 17th century, because Holder was the first Englishman to spell out an explicit application of a thoroughly developed phonetic theory. By applying an empirical method based on inductive principles, he sought to analyze the speech act itself. Having verified his experiments, he tried to proceed to generalizations. In *Elements*, Holder proposed a classification of human sounds by referring to the manner and place of articulation. For this purpose, he developed a system of contrastive analysis. His treatise shows that he was also aware of suprasegmental phenomena, e.g., 'accent' and 'emphasis.'

In the *Appendix*, he ascribed the muteness of deaf people to hearing impairment and not to articulatory deficits. His method of teaching was similar to that of Johann Conrad Amman; both relied on the visual and haptic experience of their students as they showed them the respective position of the articulatory organs in regard to each sound. The students were also encouraged to touch their teacher's articulators. It was mainly Holder's belief in the compensatory capacities of his students' senses that inspired him to use this method.

Holder was not only a speech therapist, but also a clergyman and musician. A canon at St Paul's cathedral in 1672, he was appointed sub-dean of the Chapel Royal in 1674. Holder married the sister of Sir Christopher Wren and heavily influenced Wren's education. Both Holder and his wife were buried in St Paul's.

De imputabilitate peccati (On the imputability of sin); *De stellis* (On the Stars), *Moralitates* and *Convertimini; Postilla super librum Sapientiae;* and commentaries on Proverbs, Canticle of Canticles, and Ecclesiasticus.

Holder, William (1616–1698)

C Neis, Universitat Potsdam, Potsdam, Germany

William Holder was born in 1616 in Southwell, Nottinghamshire, England and died on January 24, 1698 in Hertford, England. Holder was a clergyman, mathematician, musician, phonetician, and speech therapist. He was the first Englishman in the 17th century to propose an explicit practical application of an advanced phonetic theory.

Holder began his studies at Pembroke Hall, Cambridge in 1633. He was elected Fellow in 1640, after his graduation. During the Civil War, he moved to Oxford, where he became a doctor of divinity at Oxford University in 1660. In 1663 he was elected to the Royal Society, which recognized his achievements in phonetics and his system of teaching the deaf and mute people. Apart from his phonetic interests, Holder also made important contributions to music theory, especially to the theory of harmony and composition.

From 1659 to 1660, he taught 10-year-old Alexander Popham, who was both deaf and mute, to speak. Holder described this experience in *Philosophical Transactions of the Royal Society* (1668), but his successful language training to Popham soon caused a public quarrel between Holder and John Wallis. Wallis, a mathematician who was a well-known instructor of deaf-mutes, taught Popham after the boy had worked with Holder. Wallis, however, credited himself alone with the successful training of Popham without mentioning Holder's merits. Holder gave his account of the dispute in his *A supplement to the philosophical transactions of July 1670, with some reflexions on Dr. John Wallis, his letter there inserted* (1678).

Holder's work with Popham had a deep impact on his phonetic theory, which he explained in his *Elements of speech: an essay of inquiry into the natural production of letters: with an appendix concerning persons deaf and dumb* (1669). The appendix was a reprint of Holder's report on his work with Popham in *Philosophical transactions*; it may be regarded as the first definitive manual of speech therapy written in England. *Elements* was a particularly valuable piece of English linguistic scholarship in the 17th century, because Holder was the first Englishman to spell out an explicit application of a thoroughly developed phonetic theory. By applying an empirical method based on inductive principles, he sought to analyze the speech act itself. Having verified his experiments, he tried to proceed to generalizations. In *Elements*, Holder proposed a classification of human sounds by referring to the manner and place of articulation. For this purpose, he developed a system of contrastive analysis. His treatise shows that he was also aware of suprasegmental phenomena, e.g., 'accent' and 'emphasis.'

In the *Appendix*, he ascribed the muteness of deaf people to hearing impairment and not to articulatory deficits. His method of teaching was similar to that of Johann Conrad Amman; both relied on the visual and haptic experience of their students as they showed them the respective position of the articulatory organs in regard to each sound. The students were also encouraged to touch their teacher's articulators. It was mainly Holder's belief in the compensatory capacities of his students' senses that inspired him to use this method.

Holder was not only a speech therapist, but also a clergyman and musician. A canon at St Paul's cathedral in 1672, he was appointed sub-dean of the Chapel Royal in 1674. Holder married the sister of Sir Christopher Wren and heavily influenced Wren's education. Both Holder and his wife were buried in St Paul's.

Holder owes his reputation as a phonetician and speech teacher before all to his *Elements*, which may be regarded as a milestone in the establishment of phonetics as a science.

Holism, Semantic and Epistemic

R Vallée, Université de Moncton, Shippagan, Canada

According to Epistemic Holism, one does not test hypotheses – individual sentences – one at a time; rather the process of testing hypotheses confronts the whole of science with reality. According to Semantic Holism, the meaning of words and sentences in a language depends on the meaning of each and every word/sentence in that language. The former is widely accepted, whereas the latter is very controversial. Both forms of holism are tied together by the idea that the meaning of sentences is given by their truth conditions.

Epistemic Holism

Scientific theories confront reality via hypotheses, and *prima facie*, hypotheses are tested one at the time. Carl Gustav Hempel (1905–1997) and Willard van Orman Quine (1908–2000) contended that this view was an oversimplification and argued for what is now known as the Duhem/Quine thesis or Epistemic Holism (EH): "Science faces the tribunal of experience not sentence by sentence but as a corporate body: the whole of science" (Quine, 1986: 620).

Science is not compartmentalized. For example, observations made by telescopes are backed by astronomy, physics, optics, and the mathematical theories used in all these theories. The argument behind EH is simple. Assume a logical empiricist's theory of meaning according to which the meaning of a sentence is given by its confirmation or verification conditions. Consider now any theoretical sentence. Such a sentence cannot be reduced to one single sentence concerning experience and connecting it directly to the world. So, it has no confirmation conditions as a single, independent item. It is connected to reality through a net of sentences, some of which get their truth conditions straight from facts with no regard for other sentences, the so-called observation sentences. It follows that a hypothesis is just a sensor of the whole science, which confronts reality and is affected as a whole through the hypothesis. Hempel (1950) wrote:

> "In order to understand 'the meaning' of a hypothesis within an empiricist language, we have to know not merely what observation sentences it entails alone or in conjunction with subsidiary hypothesis, but also what

Holism, Semantic and Epistemic

R Vallée, Université de Moncton, Shippagan, Canada

According to Epistemic Holism, one does not test hypotheses – individual sentences – one at a time; rather the process of testing hypotheses confronts the whole of science with reality. According to Semantic Holism, the meaning of words and sentences in a language depends on the meaning of each and every word/sentence in that language. The former is widely accepted, whereas the latter is very controversial. Both forms of holism are tied together by the idea that the meaning of sentences is given by their truth conditions.

Epistemic Holism

Scientific theories confront reality via hypotheses, and *prima facie*, hypotheses are tested one at the time. Carl Gustav Hempel (1905–1997) and Willard van Orman Quine (1908–2000) contended that this view was an oversimplification and argued for what is now known as the Duhem/Quine thesis or Epistemic Holism (EH): "Science faces the tribunal of experience not sentence by sentence but as a corporate body: the whole of science" (Quine, 1986: 620).

Science is not compartmentalized. For example, observations made by telescopes are backed by astronomy, physics, optics, and the mathematical theories used in all these theories. The argument behind EH is simple. Assume a logical empiricist's theory of meaning according to which the meaning of a sentence is given by its confirmation or verification conditions. Consider now any theoretical sentence. Such a sentence cannot be reduced to one single sentence concerning experience and connecting it directly to the world. So, it has no confirmation conditions as a single, independent item. It is connected to reality through a net of sentences, some of which get their truth conditions straight from facts with no regard for other sentences, the so-called observation sentences. It follows that a hypothesis is just a sensor of the whole science, which confronts reality and is affected as a whole through the hypothesis. Hempel (1950) wrote:

> "In order to understand 'the meaning' of a hypothesis within an empiricist language, we have to know not merely what observation sentences it entails alone or in conjunction with subsidiary hypothesis, but also what

> other, non observational, empirical sentences are entailed by it, and for what other hypotheses the given one would be confirmatory or disconfirmatory. In other words, the cognitive meaning of a statement in an empirical language is reflected in the totality of its logical relationships to all other statements in that language, and not to the observation sentences alone."

In that conception, there is no clear-cut distinction between changing the theory and changing the meaning of sentences. When a hypothesis is proven false, one can alter either other parts of the theory, the so-called auxiliary hypothesis, or the meaning of the sentences of the theory. EH is sometimes offered as a reason for Semantic Holism: EH and the empiricist theory of meaning lead to SH. If the meaning of a sentence is determined by its verification conditions and if they are holistic, the meaning of a sentence is also determined holistically. EH and Semantic Holism are independent views on different topics: scientific theories and language. However, they dovetail.

Semantic Holism

Although EH is sentence oriented, Semantic Holism (SH) covers both sentential and subsentential items. There are different versions of SH, but its basic tenet is that the meaning of a sentence/word is determined by, depends on, or is constituted by, its relation to *all* the sentences/words in a language.

The Argument from Compositionality and the Context Principle

SH is usually not advocated in and of itself. EH can motivate it. It can also be introduced as a consequence of two independently motivated, nonepistemic linguistic principles and a truth-based semantics. It is based on two principles:

1. *Principle of Compositionality*: The meaning of a sentence is a function of the meaning of its constituents and their syntactic relationship
2. *Context Principle:* "Only in the context of a sentence does a word have meaning" (Frege, 1978: x).

To give the meaning of a word, one must give the meaning of all sentences in which it occurs; that is, the truth conditions of all these sentences. Davidson (1967: 22) followed the argument to its obvious conclusion that "only in the context of a language does a sentence (and therefore a word) have meaning." The meaning of a word or a sentence is determined by the language to which it belongs.

SH opposes 'Semantic Atomism,' which holds that the meaning of a sentence/word is *independent* from the meaning of *all* the other sentences/words in a language. Semantic Atomism proposes either the referent of a word or an abstract entity, like a Fregean sense, as the meaning of a word. From then on, meanings can be piled up.

SH also opposes '*Semantic Molecularism*,' which holds that the meaning of a sentence/word is determined by, depends on, or is constituted by its relation to *some* of the sentences/words in a language.

Both the Principle of Compositionality (PC) and Context Principle (CP) are *a priori*, methodological principles in theoretical semantics. Semantic Holism *per se* is not methodological in nature. Following from two *a priori* principles, it is also *a priori*. It emphasizes that the words/sentences would have no meaning outside that whole and would have a different meaning in a different whole. The PC mentions syntax and applies to complex expressions. SH applies to both simple and complex, structured expressions as well. It is also very general and is not tied to a specific notion of meaning, view on human language, or program in semantics. It simply requires sentences and truth conditions, as opposed to words and referents, to be basic in semantics. SH is also a metaphysical view on language and meaning (see Fodor and Lepore, 1992). In that respect, it has no clear purchase value in theoretical or applied linguistics. On the other hand, as long as it is not incompatible with empirical research, there is no point in rejecting (or in accepting) it.

One can argue for SH in Conceptual Role Semantics (Block, 1986). That conception of semantics is grounded on the functionalist theory of the mind, which takes thought contents to be functionally defined and the meaning of sentences/words to reflect thought contents (*see* **Mentalese**).

According to Conceptual Role Semantics, the meaning of a token of a linguistic expression is constituted by its inferential properties.

In this view, SH does not follow from methodological principles, but is a plain assertion about meaning. It also concerns tokens, not types, and in that respect, it is an individualistic doctrine. This version of SH is arguably a metaphysical approach to meaning. It is also designed to fit a functionalist view of mental states. Block, the main proponent of Conceptual Role Semantic (CRS), was careful to mention that CRS is not a theory, but a framework for developing semantic theories.

Problems with Semantic Holism

SH raises vexing philosophical issues. Does SH reflect substantial properties of meaning? Does it have an ontological scope? If human languages are holistic, is being holistic an essential property of human languages? Or does SH just echo our way of capturing meaning in a theory, being an artifact produced

by our way of theorizing/knowing the semantics of natural languages? SH has *prima facie* implausible consequences for linguistics.

Learning Problem If SH is true, then one cannot learn the meaning of a lexical item without learning a whole language. It also implies that, to understand the meaning of one single word/sentence a speaker utters, one must be able to understand all words/sentences that speaker can utter. To master the meaning of one single word, one must master a whole language. That makes learning and understanding a language an 'all or nothing' affair, and it implies that learning/mastering part of a language does not make sense. Friends of holism reply that "in so far as we take the 'organic' nature of language seriously, we cannot accurately describe the first steps toward its conquest as learning part of a language; rather, it is a matter of partly learning" (Davidson, 1965: 7). Some (Dressner, 2002) have argued that this fits what we know about the psychology of language learning. Holism apparently opposes the PC – the meaning of one sentence cannot be determined in the way described by the PC because the whole language is involved. However, it is arguable that there is no problem in that quarter. The PC presupposes that the meaning of an unstructured item is determined, and a functional relation is applied to these items. Being determined by and being a function of are two different relationships. Insofar as determination is concerned, *prima facie*, both holism and the PC can be true.

Instability Problem SH also implies that, by adding terms to the language or by altering the meaning of one single word/sentence in a language, one alters the meaning of all words/sentences in that language. As a consequence, the language of a speaker changes constantly because words/sentences are introduced and/or the meaning of lexical items is altered. In addition, two speakers do not speak the same language or use expressions having the same meaning, because the meaning of the words/sentences of a speaker differs from the meaning of the words/sentences of another speaker insofar as they do not share the same vocabulary or produce the same sentences.

Disagreement Problem If two tokens of the same type differ in meaning, then speakers cannot disagree or agree, for that matter, on a sentence. The fact that you accept and that I reject 'Snow is white' does not show that we disagree on anything; the fact that we both accept the same sentence does not show that we agree on anything. The reason is the same in both cases: The tokens have different meaning in the two idiolects, and agreement or disagreement requires sameness of meaning.

SH can be escaped if truth and sentences are not treated as basic in semantic. It can also be avoided if the PC or the CP is rejected. The PC draws wide agreement. The CP is more controversial, and Atomism rejects it. SH inherits certain indeterminacy from the premises leading to it. What do 'is determined by,' 'depends on,' 'is constituted by,' and 'meaning' mean exactly in SH? These terms are not designed to be read in a mathematical way, and they remain controversial. How can sound, *a priori* methodological principles have dramatic metaphysical consequences? Those questions do not make the problem disappear, but prove how opaque it is. The Conceptual Role Semantic version of Semantic Holism can be rejected by refusing CRS.

Semantic Holism and the Philosophy of Mind

Meaning is connected to thought content. Replace the relevant words in the above principles, and you end up with the idea that thought contents have a compositional aspect and that a single thought content is determined by all of one's thought contents. Changing one belief also implies altering the web of beliefs, and hence each belief – this is the instability problem raising its head in the philosophy of mind – and to know one single thought content of a speaker, one must know all of his other thought contents. Fodor and Lepore (1992) drew attention to the fact that, if SH is true and if meaning is echoed in thought contents, then we cannot share a thought unless we share all of our thought contents, and trying to state psychological laws is a futile project, doomed from the start.

Conclusion

Wherever one looks, one finds only implausible consequences of SH. As a consequence, it never served as the basis for a detailed research program in semantics. However, it did bring the analytic philosopher one step closer to the Hermeneutic tradition. Hermeneutics is thoroughly holistic.

Holmes, Janet (b.1947)

M Meyerhoff, University of Edinburgh, Edinburgh, UK

Janet Holmes was born in Liverpool on May 17, 1947. The eldest of Muriel and Robert Quirk's four children, she completed a B.A. at Leeds University and then an M.Phil. under the supervision of John Pride and John Strover. In July 1970 she moved to New Zealand to take up a lecturer (assistant professor) position in linguistics at Victoria University of Wellington. She settled there permanently, raising two sons with her husband, Tony. She played an influential role in shaping the character of the Department of Linguistics (formally instituted in 1985). In 1993, Holmes was awarded a personal chair in Linguistics, and in 1994 was elected Fellow of the Royal Society of New Zealand, an honor only rarely extended to social scientists.

Holmes has made New Zealand a dynamic center for research into sociolinguistics. Her skills at establishing collaborative ventures across universities and between the university and the business community have maintained the vitality of the field even in an era of increased competition for decreased academic funding in New Zealand. Her interests are politeness theory, language and gender, ethnicity, discourse, and New Zealand English. Her track record of gaining research funding is impressive; her research projects have not only produced many scholarly publications, but also provided invaluable training for younger scholars, many of whom have gone on to pursue academic careers of their own. Corpus-based social dialectology led by Holmes has made NZ English one of the best documented varieties in the world.

Holmes was one of the first researchers to look critically at Robin Lakoff's notion of 'women's language,' and her work (1984 forward) has highlighted the interplay between gender and other social factors such as politeness. Her work (e.g., 1986) consistently stresses the importance of going beyond assumptions of one-to-one mappings between form and function and supports this with naturally occurring data. Her focus on form–function relations includes careful attention to intonation, still often neglected. She continues to defend the practice of analyzing politeness using both qualitative and quantitative methods, in the face of postmodern challenges to this approach.

Holmes's studies of workplace interaction have ranged from the interactional function of humor, through to analyses of effective management style in medicine, manufacturing, and white collar offices. Here, too, Holmes has stressed interdisciplinarity and action-based research. She is author or editor of 12 monographs, over 180 academic articles, and more than 30 general audience articles on sociolinguistics. Many have been reprinted and translated. She is also an active reviewer for journals and monographs. She has supervised or examined 80 postgraduate theses and dissertations.

Holtsmark, Anne (1896–1974)

S Kürschner, Albert-Ludwigs-Universität, Freiburg im Breisgau, Germany

On June 6, 1896, Anne Elisabeth Holtsmark was born in Oslo, Norway. She started her scientific career with university studies in Norwegian, French, and history in Oslo, where she finished her studies in 1924. From 1925 to 1926 she was lector in Hamburg, Germany. She returned to Oslo in 1926 and worked as an assistant at the University Library. In this position, she started extensive philological work including linguistics, modern literary studies, and scientific research on Old Norse manuscripts from Iceland and Norway. Her work included a considerable number of translations to New Norwegian. Anne Holtsmark became a philologist with international influence in the field of Scandinavian studies.

Holtsmark published her work on the manuscript AM 114a 4° in 1931 with the title 'En tale mot biskopene' (A speech against the bishops). Her text-critical work included new results on the potential author of this important Norwegian manuscript from the Middle Ages, which defended the Norwegian king's steps against the church. By palaeographical and linguistic contrast, Holtsmark shed doubt on earlier ideas concerning the exact date of the emergence and the author. Her methods included new advances in physical manuscript treatment: Holtsmark introduced ultraviolet wave illumination to make greased parts of the manuscript readable. By adding the manuscript in facsimile and in a diplomatory format, Anne Holtsmark made the text available to a greater public. Editing Norse manuscripts continued to be one of her main scientific fields in the future, cf. the facsimile editions of 'A Book of Miracles' (AM 645 4°), *Legendarisk Olavssaga* (The legendary Olavssaga) (DelaGardie 8 II), and the *Olav Tryggvasons saga* (AM 310 4°).

From 1931, Holtsmark was university lecturer of Old Norse philology in Oslo. From that moment on, she started university teaching parallel to her research work. Her teaching concentrated on the literature of the Nordic Middle Ages, most of all the Edda and the sagas. In 1936, Holtsmark received a doctoral degree for her work on the 'First grammatical treatise,' a manuscript from the 12th century on the Icelandic grammar of that time. Her dissertation was entitled 'En islandsk scholasticus fra det 12. århundrede' (An Icelandic scholar from the 12th century). Holtsmark offered new insights into the question of who the author of this first Nordic grammar was. Holtsmark studied the manuscript's origin using new methods: she compared the author's ideas to the Western European scientific traditions of that time, especially concentrating on France and the possible Irish influence (which she showed to be overestimated). Her conclusion on the 'First grammatical treatise' was that the grammar featured an exact description of the Old Icelandic sound system. This was carefully worked out to form an orthophonic alphabet. Holtsmark continued her work on old manuscripts from a literary and historical point of view. In addition, her research topics began to include the myths and the legends in the skald and Edda literature.

In 1949, Anne Holtsmark became professor of Old Norse philology at the University of Oslo. She continued her linguistic work and prepared a collection of the vocabulary in the oldest Norwegian manuscripts. It resulted in the book *Ordforrådet i de eldste norske håndskrifter til ca. 1250* (The vocabulary in the oldest Norwegian manuscripts up to c. 1250), which was published in 1955. The work had been started in the early 20th century by Swedish philologists. It was planned to be a companion volume to a similar edition on the Old Icelandic vocabulary by Ludvig Larsson published in 1891. Holtsmark's own editing of Old Norwegian manuscripts made the entire collection more effective. When the project moved to her institute in Oslo, the collection was finally completed.

Anne Holtsmark wrote articles in large numbers, mostly for Norwegian philological journals like *Maal*

Holtsmark, Anne (1896–1974)

S Kürschner, Albert-Ludwigs-Universität, Freiburg im Breisgau, Germany

On June 6, 1896, Anne Elisabeth Holtsmark was born in Oslo, Norway. She started her scientific career with university studies in Norwegian, French, and history in Oslo, where she finished her studies in 1924. From 1925 to 1926 she was lector in Hamburg, Germany. She returned to Oslo in 1926 and worked as an assistant at the University Library. In this position, she started extensive philological work including linguistics, modern literary studies, and scientific research on Old Norse manuscripts from Iceland and Norway. Her work included a considerable number of translations to New Norwegian. Anne Holtsmark became a philologist with international influence in the field of Scandinavian studies.

Holtsmark published her work on the manuscript AM 114a 4° in 1931 with the title 'En tale mot biskopene' (A speech against the bishops). Her text-critical work included new results on the potential author of this important Norwegian manuscript from the Middle Ages, which defended the Norwegian king's steps against the church. By palaeographical and linguistic contrast, Holtsmark shed doubt on earlier ideas concerning the exact date of the emergence and the author. Her methods included new advances in physical manuscript treatment: Holtsmark introduced ultraviolet wave illumination to make greased parts of the manuscript readable. By adding the manuscript in facsimile and in a diplomatory format, Anne Holtsmark made the text available to a greater public. Editing Norse manuscripts continued to be one of her main scientific fields in the future, cf. the facsimile editions of 'A Book of Miracles' (AM 645 4°), *Legendarisk Olavssaga* (The legendary Olavssaga) (DelaGardie 8 II), and the *Olav Tryggvasons saga* (AM 310 4°).

From 1931, Holtsmark was university lecturer of Old Norse philology in Oslo. From that moment on, she started university teaching parallel to her research work. Her teaching concentrated on the literature of the Nordic Middle Ages, most of all the Edda and the sagas. In 1936, Holtsmark received a doctoral degree for her work on the 'First grammatical treatise,' a manuscript from the 12th century on the Icelandic grammar of that time. Her dissertation was entitled 'En islandsk scholasticus fra det 12. århundrede' (An Icelandic scholar from the 12th century). Holtsmark offered new insights into the question of who the author of this first Nordic grammar was. Holtsmark studied the manuscript's origin using new methods: she compared the author's ideas to the Western European scientific traditions of that time, especially concentrating on France and the possible Irish influence (which she showed to be overestimated). Her conclusion on the 'First grammatical treatise' was that the grammar featured an exact description of the Old Icelandic sound system. This was carefully worked out to form an orthophonic alphabet. Holtsmark continued her work on old manuscripts from a literary and historical point of view. In addition, her research topics began to include the myths and the legends in the skald and Edda literature.

In 1949, Anne Holtsmark became professor of Old Norse philology at the University of Oslo. She continued her linguistic work and prepared a collection of the vocabulary in the oldest Norwegian manuscripts. It resulted in the book *Ordforrådet i de eldste norske håndskrifter til ca. 1250* (The vocabulary in the oldest Norwegian manuscripts up to c. 1250), which was published in 1955. The work had been started in the early 20th century by Swedish philologists. It was planned to be a companion volume to a similar edition on the Old Icelandic vocabulary by Ludvig Larsson published in 1891. Holtsmark's own editing of Old Norwegian manuscripts made the entire collection more effective. When the project moved to her institute in Oslo, the collection was finally completed.

Anne Holtsmark wrote articles in large numbers, mostly for Norwegian philological journals like *Maal*

og Minne. She wrote and edited 10 scientific monographs, including work on texts from the Middle Ages, all within her broad field of research. In addition, Anne Holtsmark wrote 120 articles for the *Kulturhistorisk leksikon for nordisk middelalder* (Culture historical lexicon for the Nordic Middle Ages). She was one of the founders of the Old Norse Dictionary Association (Gammelnorsk Ordboksverk) and the Association for Norwegian Culture Research (Forening til Norsk Kulturgransking). From 1941, Holtsmark was a member of the Norwegian Scientific Academy. She received the Royal Norwegian Order of Saint Olav and the Icelandic Falke-order for her lifetime work.

Holtsmark's main interest was the medieval language and its sources in literary texts, and she ranks among the most important Scandinavian philologists, especially for medieval studies. In her scientific work, Holtsmark maintained a broad scope, including linguistics, literature studies, and broader cultural studies. She also worked in fields combining all disciplines, and she presented results not possible without considerable knowledge of all these fields. In all of her work, Holtsmark was known to be very accurate. She based her results on a very exact text analysis, be it literary or linguistic research. For this reason, Holtsmark's work is still of great importance for current medieval research in Scandinavian Studies. Anne Holtsmark died on May 19, 1974.

Homans, George C. (1910–1989)

W A Hass, St Peter, MN, USA

George Homans was a pioneer of sociological exchange theory. Born in Boston, in the Back Bay area, Homans was the son of a prominent physician; his mother was a member of the famous Adams clan. He attended the St Paul's School, Concord, New Hampshire, and Harvard (B.A., 1932). He became well acquainted with Pareto's work just after graduation, and took up sociological investigations as a Harvard junior fellow. His teaching career began and continued in sociology at Harvard (1939–1980), with time out during World War II to serve as a naval officer, returning to the Department of Social Relations there in 1945 until the end of his scholarly career.

Homans devoted his intellectual efforts to explaining social behavior, or, in slightly different terms, to basing social sciences on propositions from behavioral psychology. Language plays no particular overt role in his conceptualization; rather than focus on verbal communication he turned to interpersonal interaction, especially exchange. His fundamental principle is that of instrumental conditioning, or less psychologically, the social feedback loop. Accordingly, in his 1961 *Social behavior*, his first general proposition is: "If in the past the occurrence of a particular stimulus-situation has been the occasion on which a man's activity has been rewarded, then the more similar the present stimulus-situation is to the past one, the more likely he is to emit the activity, or some similar activity, now" (p. 53).

His analysis of human interaction, which can be seen as a modern version of hedonism or utilitarianism, is found implicitly in his *English villages of the 13th century* (1941). It is demonstrated explicitly, but still predominantly inductively in his *Human group* (1950), which approaches various specific face-to-face social phenomena in behavioral terms. These include the Western Electric Hawthorne Works in Chicago, an East Coast slum gang, Tikopia families, a New England village, and an electrical equipment company. These groupings allow him to point out issues in social organization, which offer paradigms for understanding society on a larger, institutional and cultural scale as well.

Homans then went on to formulate more general behavioral principles, in terms of rewarded activities, and the exchanges in which they are involved, and to

L

Laboratory Phonetics

J Kingston, University of Massachusetts, Amherst, MA, USA

Anyone who has seen *My Fair Lady* will recall the scene in which Henry Higgins sets Eliza Doolittle the task of pronouncing "In Hartford, Hereford, and Hampshire, hurricanes hardly ever happen" to test her dropping of [h]s where they belong and her adding them where they do not belong. Eliza is to speak this utterance into a cone attached to a tube whose other end is attached to a valve emitting a flame. Every time she pronounces an [h], the flame briefly jets out further – this only occurs when she says "[h]ever" and not when she says any of the words spelled with "h." The other part of this apparatus is a revolving cube with mirrored sides, in which the flame is reflected. Eliza becomes mesmerized by the revolving reflections and mechanically recites the sentence over and over, until the flame ignites her script.

The device depicted is apparently a 'Koenig flame manometer' (Koenig, 1872), which was widely used by phoneticians in the late 19th and early 20th centuries to measure variation in acoustic pressure from the mouth: the flame jets out further when acoustic pressure is higher. The revolving mirrored cube thus captures changes in acoustic pressure over time in the height of the reflected flame. Because the observer does not separate the successive reflections as each face of the cube turns into the plane of view, they are superimposed onto one another, creating an apparently static image of time-varying acoustic pressure. Different speech sounds produce different images, which could then be used to investigate their phonetic properties. (Ironically, this device could not be used to measure much slower changes in aerodynamic pressure, nor the increase in oral air flow that characterizes an [h].)

Another memorable scene from *My Fair Lady* is the one when Eliza first meets Henry Higgins, and he demonstrates his ability to place people in London and elsewhere in England by the nuances of their pronunciation. He also shows Eliza and the others what he's been writing down in his notebook, a phonetic transcription of her speech.

These two scenes illustrate the contrasts between 'field phonetics' and 'laboratory phonetics,' the topic of this entry. The goal of field phonetics is a **qualitative** description, which uses categorically distinct symbols to record the transcribable phonetic properties of a person's speech. To confirm the transcription, a skilled field phonetician typically imitates the speaker's utterance. If the speaker judges the imitation to be a close match, the phonetician infers that both the original utterance and the imitation were pronounced more or less identically. Both the goal and methods of laboratory phonetics are quite different. Its goal is to **quantify** the continuously varying values of the speaker's articulations, the resulting acoustics, and the listener's perceptual response, and to relate those continuous quantities to the categorical qualities that distinguish one message from another. To achieve this goal, laboratory phonetics uses instruments and experiments, rather than the careful listening and imitation of field phonetics. Yet despite the difference in principle between laboratory phonetics and field phonetics, in practice, most phonetic research combines the two, as Henry Higgins did. Indeed, it is more than fitting that the phonetic consultant to *My Fair Lady* was Peter Ladefoged, the phonetician whose work epitomized the combination of field and laboratory phonetics.

The remainder of this entry is broken into three parts. The first part discusses the instrumentation and software that are widely used in laboratory phonetics and describes the uses to which they are put. The second part lists persistent research problems and the research practices that have been developed in attempts to solve them; this list is incomplete. Finally, the third section discusses two recent important developments in laboratory phonetics: the increasing use of natural corpora, and the attempt to integrate phonetics and phonology, called 'laboratory phonology.'

Instrumentation and Software

The Koenig flame manometer was simply one of a large variety of ingenious instruments and techniques devised in the late 19th and early 20th centuries to measure phonetic properties of utterances. Among many others, the reports of Rousselot (1897–1908) and Scripture (1902) stand out as comprehensive reviews of their own and many others' instrumental investigations of virtually all aspects of the articulation, acoustics, and perception of speech sounds. In many cases, today's instruments and software are merely refinements of devices invented a century and more ago.

Aerodynamics

Speech is the transformation of energy first embodied in air flow into sound, so this review of instrumentation begins with the devices used to measure changes in the volume and pressure of the cavities containing air and air flow between these cavities, i.e., the aerodynamics of speech.

Changes in chest cavity volume are measured with either a 'plethysmograph' or transducers attached to the chest wall and abdomen. In a whole-body plethysmograph, the speaker is placed in a large airtight container and breathes in and out through a mask connected to the outside. As the speaker's chest and abdomen expand and contract, his or her body takes up more and then less room in the container, compressing and then rarefying the surrounding air. These changes in pressure directly reflect the changes in chest cavity volume. In a variant design, compressible air bulbs are attached to the speaker's chest and abdomen, and chest cavity volume is measured by the changes in air pressure inside these bulbs. An alternative means of measuring changes in chest cavity volume is to attach a magnetic field source to the back and transducers capable of measuring the strength of that field to the front of the chest and abdomen; as the chest and abdomen expand and contract, the distance between the field source and the transducer increases and decreases, and with those distance changes, the strength of the field detected by the transducer wanes and waxes.

These volume changes are all intended to change air pressure in the lungs, which in turn determines whether air flows into or out of the lungs. Speech is nearly always produced during an exhalation, when the pressure in the lungs is greater than the pressure downstream in the vocal tract. The pressure of the air in the lungs is also a measure of how much energy is available to produce sound. This pressure is usually measured in the trachea, either through a pressure transducer attached either to a wide-bore needle inserted between two tracheal rings, or via a catheter attached to a balloon swallowed into the esophagus (the esophagus shares a wall with the trachea, so as pressure rises in the trachea, distending its walls, the balloon in the esophagus is compressed). The energy embodied in the tracheal pressure is first transformed into sound when it causes the vocal folds to vibrate, producing a rapid variation in acoustic pressure just downstream. Speakers contract the lungs more rapidly when emphasizing a syllable, and the resulting increase in air pressure in the trachea increases both the rate and size of vocal fold vibration and thus the fundamental frequency and intensity of this sound source (Ohala, 1990).

Air pressure in the oral cavity is measured via a catheter inserted either into the corner of the mouth or through a nostril over the soft palate into the pharynx. The pressure transducer may be in the catheter itself or outside. Some sounds obstruct the flow of air out of the mouth more than others and cause air pressure to build up behind that obstruction. When air pressure is elevated, air flow increases through any open channel. If the increase is great enough, flow becomes turbulent, and this turbulence is audible as noise. This is the second way in which energy embodied in elevated pressure is turned into sound.

Finally, air flow out of the mouth or nostrils, or even inside the oral cavity, is measured using a 'pneumotachograph.' This device applies Poiseuille's law, which states that laminar (nonturbulent) flow between two locations in a tube is proportional to the pressure loss between those locations. In practice, a known resistance to airflow is introduced between the two locations at which pressure is measured.

Muscle Activity

The volume of the chest cavity could not be changed, nor could any other articulation be made, without contracting muscles. Because voltages change in muscles when they contract, the extent and timing of their contraction can be measured by attaching electrodes to the skin surface overlying the muscles or actually inserting the electrodes directly into the muscles. Surface electrodes capture the voltage changes in all the underlying muscle fibers, as do large electrodes inserted into the muscles themselves, but it is also possible to record from single muscle units using finer electrodes. This technique is called 'electromyography.'

Glottal Articulations

The larynx, or more specifically, the vocal folds serve as a valve controlling air flow between the lungs or

subglottal cavity and the oral or supraglottal cavity (the glottis is the space between the vocal folds through which air flows when this valve is open). As already noted, the vibration of the vocal folds is also the one of the two means whereby the energy in the air flowing out of the lungs is transformed into sound.

The position and motion of the vocal folds can be imaged directly by inserting a mirror through the mouth into the upper pharynx, or via an endoscope inserted into the mouth or through the nose into the pharynx. The motion of the vocal folds during vibration can then be captured by filming the image at high speeds. When the light source is strobed synchronously with vocal fold vibration, it is also possible to capture still images of the folds at different moments in their vibratory cycle.

'Electroglottography' (EGG) and 'photoglottography' (PGG) are two other means of measuring the position of the folds and the state of the glottis. In EGG, two electrodes are placed on either side of the thyroid cartilage at the height of the glottis and a weak current is passed between them. As the folds move apart or together, opening or closing the glottis, resistance to this current's flow increases or decreases. In PGG, a light source is placed above or below the glottis, and a phototransducer is placed on the other side. As the folds move apart or together, the amount of light passing through the glottis and falling on the transducer waxes and wanes. These two techniques complement one another. The change in resistance to current flow is greatest at the moment when the folds first make contact or separate all along their length, so EGG measures the moment when the glottis closes or starts to open most accurately. The most light falls on the phototransducer when the folds separate maximally, so PGG measures the moment of peak opening in a particular glottal articulation with the greatest precision.

All these methods are limited in what they show about the motion or position of the vocal folds: filming only shows the folds from above, and EGG and PGG only depict accurately the moments of fold contact and peak glottal opening. By permitting the folds' cross-section to be imaged, ultrasound laryngography has shown how vibration propagates from the lower to the upper edge of the folds. These limitations of all these techniques apply only to the vocal folds *in vivo*. Larynges excised from dogs have been used extensively to study the nature of vocal fold movement during vibration (Moore and Berke, 1988; Perlman and Titze, 1988; Titze *et al.*, 1997).

Finally, a number of devices have been used to measure the vertical movement of the larynx in the neck. Among them is the 'thyroumbrometer,' in which a light is shone past the profile of the neck, casting a shadow onto a two-dimensional grid of phototransducers on the other side. By recording changes over time in the amount of light falling onto the transducers, the shadow can be tracked and the height of the larynx determined from the position of the thyroid prominence.

Oral Movements and Articulatory Contact

Movements of the oral articulators – the tongue, lips, and soft palate – have been measured mechanically and by various imaging techniques. The mechanical means all involve attaching to or resting a low-mass lever on the articulator of interest and then measuring the movement of its other end when that articulator moves. In the past, the movement of the other end was measured directly using a kymograph, a device that draws a trace on paper that is proportional in size to the lever's movement. In modern use of this technique, the other end of the lever is instead attached to a strain gauge, which emits a voltage proportional to the size of the movement of the lever arm. This method is most suitable for measuring movements of the visible articulators – the lips and jaw – and has also been used successfully in recording soft palate movements (the lever is inserted through the nose and one end rests on top of the soft palate), but it is not suitable for measuring tongue movement, because this articulator's shape and position in the oral cavity change enormously from one speech sound to the next. An imaging technique has also been widely used to track the movements of the visible articulators: Infrared-emitting diodes are placed on the articulators of interest, and their positions in three dimensions are tracked by combining images from multiple cameras (Munhall and Vatikiotis-Bateson, 1998).

Filming of radiographs ('cineradiography') was the first means used to image tongue movement effectively. The tongue and any other oral articulator of interest would be painted with a barium paste to improve contrast, and the X-ray beam would be directed at the speaker from the side. The disadvantage of this technique is that the speaker is exposed to an enormous amount of ionizing radiation in a very short period of time, so only a small amount of data can be collected. Because even the radiation dose received in a short recording session is dangerous to the speaker, this technique is no longer used.

The 'X-ray microbeam' was built to replace cineradiography (Nadler *et al.,* 1987). This technique aims a very narrow beam of very high-energy X-rays at gold pellets glued to the articulators; the narrowness and high energy of the beam reduces the radiation dose received during a 10-minute recording session (48 mRad) to little more than that received during a

routine full-mouth dental X-ray examination (10 to 30 mRad). Unlike cineradiography, which provides an image of the entire surface of the tongue or any other articulator within the X-ray beam, the X-ray microbeam measures only the positions of the gold pellets, or the 'flesh points' to which they are attached. (The use of cameras to track the positions of infrared-emitting diodes also measures the positions of flesh points.) Fortunately, the tongue is hydrostatic, so the distances between pellets and the corresponding flesh points are not changed by movements of the tongue or changes in its shape.

The other widely used technique for measuring flesh points inside the vocal tract, 'electromagnetic midsagittal articulometry' (EMMA), uses small magnets instead of gold pellets (Perkell *et al.,* 1992; for comparison of the X-ray microbeam and EMMA, see Byrd *et al.,* 1999). The three-dimensional positions of these magnets is registered by an array of magnetic field transducers mounted on a cage surrounding the speaker's head. As implied by its name, EMMA only permits imaging of flesh point locations in the midsagittal (profile) plane. This is also true of the traditional X-ray and X-ray microbeam techniques, because it is too dangerous to direct the X-rays toward either the brain or the spinal cord.

The two remaining techniques, 'ultrasound' and 'magnetic resonance imaging' (MRI), do not share this limitation; they can be used to image the vocal tract in any plane. Nor are these techniques limited to tracking the locations of flesh points; like cineradiography, ultrasound and MRI both produce anatomically complete images. Each, however, is limited in other ways.

Ultrasound images are constructed from the time delay between the sound's emission and the return of its echo from a boundary, e.g., between the flesh and air at the tongue surface (Stone *et al.,* 1988, 1992; Stone and Lundberg, 1996). The delay increases, the further the tongue surface is from the sound source. Although the surface of the tongue root and body can be readily imaged, the surface of the tongue tip and blade often cannot be because there is an air pocket beneath this part of the tongue, and the sound echoes off the boundary between the floor of the mouth and this air pocket before ever reaching the tongue tip and blade.

The principal limitation with MRI is that it takes a long time to record an image. In the earliest uses of this method, the speaker had to move the articulators to their positions in the sound of interest and then hold them there for a number of seconds. Obviously, the continuous movements of connected speech could not be studied under these conditions. However, procedures have recently been developed that permit five to 10 and soon perhaps as many as 20 images to be collected per second (Demolin *et al.,* 2000; Narayanan *et al.,* 2004). In addition to these limitations, visual signal processing algorithms must be applied to these images to quantify articulator positions and movements, a challenge that does not arise in techniques that measure the positions of flesh points.

All of these techniques measure articulatory movements or positions. 'Palatography' measures the contact of the tongue with the palate. Traditionally, a dark substance, e.g., a mixture of charcoal dust and olive oil, is painted on the tongue surface, the speaker pronounces the target sound (nearly always a consonant), a mirror is inserted into the mouth, and the reflection of the palate is photographed. The dark substance rubs off on the palate or teeth in the locations wherever the tongue touched it. The result is a 'palatogram.' A 'linguogram' can be obtained by painting the palate instead and photographing the tongue surface after the speaker pronounces the target sound (see Dart, 1991, 1998 for a recent use of this traditional technique). This technique has two obvious drawbacks: only a single articulation can be measured at a time, and it is impossible to measure its trajectory.

An elaboration of this technique, 'electropalatography' (Gibbon and Nicolaidis, 1999), does away with both of these drawbacks. An artificial palate covered with a dense array of electrodes is fit to the speaker's palate. A circuit is completed whenever the speaker's tongue contacts an electrode, so the pattern and timing of electrode contacts can be used to track the tongue's contact with the palate from moment to moment in indefinitely long stretches of speech. Electropalatography is subject to two limitations: the palates must be fit individually to each speaker, so it is difficult to study more than a few speakers, and the palates do not extend back beyond the hard palate, so it is impossible to record contact made with the tongue body on the soft palate or further back.

Acoustics

The acoustic analysis of speech relies on the source-filter model of speech production (Fant, 1960). A sound source is created when the energy embodied in the flow of air through the vocal tract is transformed into sound. The first kind of sound source is the (quasi-)periodic variation in air pressure produced just above the glottis by the vibrating vocal folds in voiced sounds; trills also produce a (quasi-)periodic sound source just downstream from the vibrating soft palate, tongue tip, or lips. The second kind is the aperiodic pressure variation produced when air rushes

turbulently through a narrow channel in obstruent sounds.

The air inside the vocal tract responds to the energy in these sound sources by resonating at a number of different frequencies, which depend on the articulators' positions. Putting the articulators in one position amplifies or passes energy at some frequencies while attenuating or stopping it at others, and moving the articulators to another position changes the frequencies at which energy is passed or stopped. Because the air resonates at different frequencies depending on the positions of the articulators, positioning the articulators filters the energy in the sound source.

Before the development of digital signal-processing techniques, the principal tools for analyzing the acoustics of speech were the 'oscillograph' and the 'sound spectrograph,' which produce an 'oscillogram' and 'spectrogram,' respectively. The oscillograph is essentially a kind of kymograph, but one that measures the moment-by-moment variation in sound pressure rather than the movement of an articulator. Figure 1 is an oscillogram of the utterance 'laboratory phonetics.' Positive and negative acoustic pressures are displayed about a zero line on the vertical axis in this display, and time is displayed on the horizontal axis. This display is often referred to nowadays as a 'waveform.'

The patterns of pressure variation differ between speech sounds of different manners of articulation and phonation type. During vowels, pressure varies between larger positive and negative extremes than during most consonants; moreover, the pressure variation is periodic in vowels, as expected, given that they are produced with the vocal folds vibrating. Periodic pressure variation can also be seen during the voiced consonants [l], [b], and the two [ɹ]s in 'laboratory,' and during the [n] in 'phonetics.' In place of this periodic pressure variation, the waveform shows brief intervals of silence for the voiceless stops [t] and [k] in 'labora[t^h]ory' and 'phoneti[k]s,' respectively, and brief intervals of aperiodic pressure variation, i.e., noise, for the voiceless fricatives [f] and [s] in '[f]onetik[s].' The interval of noise following the silent interval of the [t^h] in 'labora[t^h]ory' is the aspiration indicated by the superscript '^{h}', which is characteristic of the pronunciation of voiceless stops before stressed vowels in American English. This waveform also displays another regular allophonic variant in this variety of English: the pronunciation of the /t/ in 'phone[ɾ]ics' as a tap. The tap's articulation, a very brief contact of the tongue tip to the alveolar ridge, produces the very brief attenuation of energy observable between the flanking vowels. The waveform shows that vocal fold vibration does not even falter during this consonant's pronunciation, unlike during the /t/ in 'labora[t^h]ory,' where the vocal folds stop vibrating for many milliseconds in the stop closure. Finally, pressure varies much more during the stressed first and third vowels in 'laboratory' and during the stressed second vowel in 'phonetics' than in the unstressed vowels in these words. The stressed vowels are also longer than the unstressed ones.

These observations show that waveforms can be segmented into acoustic intervals. These acoustic intervals do not correspond exactly to the transcribed segments, but nonetheless nearly all the intervals can be assigned to one of these segments – the most difficult segmentations in this example are separating the two [ɹ]s in 'laboratory' from the adjacent vowels. The size of the pressure variation distinguishes vowels

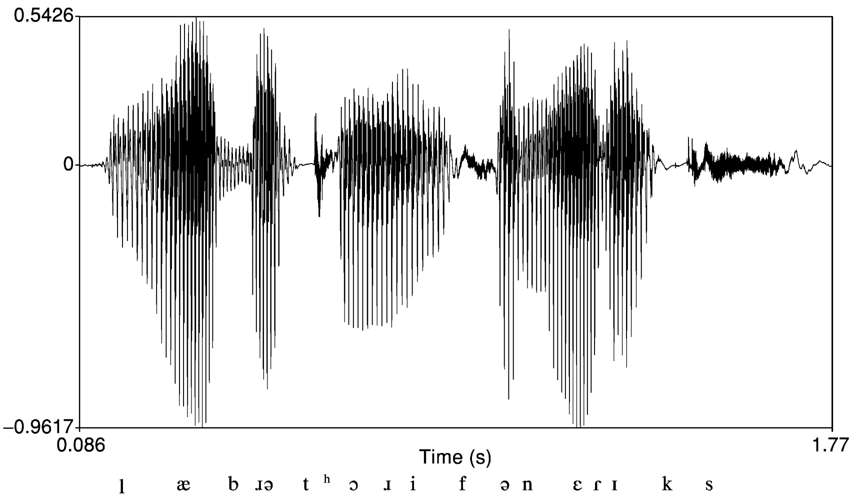

Figure 1 Waveform of the utterance 'laboratory phonetics.'

from consonants, particularly obstruents. The periodic or aperiodic nature of the pressure variation within these intervals can be used to identify their sound sources. Duration can also be measured in both vowel and consonant intervals. However, the durations of these acoustic intervals do not correspond to the durations of the articulatory movements, which begin well before the corresponding acoustic interval and end long after it. So long as the movement is occurring while the vocal tract is not completely closed or narrowly constricted, i.e., not during a stop closure or fricative constriction, then it is possible to see the acoustic effects of these movements by closely inspecting the waveform, as shown by the waveform fragment corresponding to the last three segments [ɔɹi] in 'laboratory' (Figure 2). At the points marked by the arrows, the shapes of the periods change; these changes reflect the changes in resonance frequencies brought about by moving the articulators from their positions in [ɔ] to their positions in [ɹ] and then from [ɹ] to [i].

These changes are much easier to see in a spectrogram of this utterance than the waveform (Figures 3 and 4). The spectrogram displays frequency rather than pressure on the vertical axis, against time on the horizontal axis. The darkness of the mark at a particular frequency and time in the spectrogram indicates how intense the sound is there, i.e., how strongly the air inside the vocal tract is resonating at that frequency and time. The utterance can be divided into acoustic intervals in this display, too, which correspond closely to the intervals discernable in the

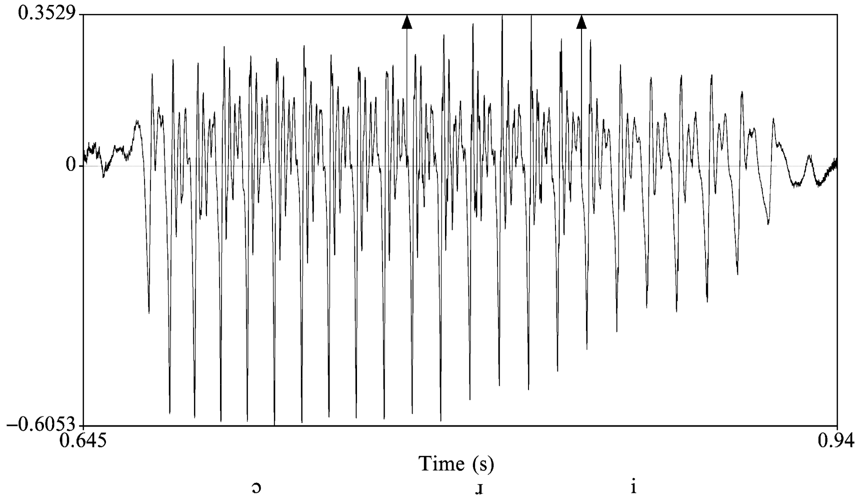

Figure 2 Waveform of the fragment [ɔɹi] from the phrase 'laboratory phonetics.' The arrows mark acoustic discontinuities that roughly correspond to the boundaries between [ɔ] and [ɹ] and between [ɹ] and [i].

waveform in Figure 1. The spectrogram shows that vowels have considerable energy spanning the range from low to high frequencies, while many consonants have much less energy; in some, e.g., the [b] in 'laboratory,' that energy does not extend above the very lowest frequencies. No energy appears, of course, at any frequency during the silent intervals corresponding to the voiceless stop closures of the [tʰ] in 'labora[tʰ]ory' and the [k] in 'phoneti[k]s.' Regular vertical striations can be seen in the intervals during which the speaker is producing a periodic sound source; each one corresponds to a single vibration of the vocal folds. Finally, time-frequency regions in which light and dark areas vary irregularly correspond to intervals of noise, when sound pressure variation is irregular, most obviously in the initial [f] and final [s] in '[f]onetik[s],' as well as the aspiration noise [ʰ] in 'laborat[ʰ]ory.'

The key piece of additional information that is provided by a spectrogram but not a waveform can be seen in the quasihorizontal dark bars visible in all the vowels and some of the consonants. These bars are called 'formants,' and they represent the ranges of frequencies within which the air in the vocal tract resonates strongly when the articulators are in a particular position. During some stretches, especially in the middle of the stressed vowels, these formants are more or less stationary, but at the edges of these stationary intervals, the formants change frequency, often quite rapidly. The stationary intervals, called 'steady-states,' are produced when the articulators are not moving much, while the intervals of formant frequency change, called 'transitions,' are produced when the articulators move from one articulatory target to another. A look at the spectrogram of the stretch corresponding to [ɔɹi]

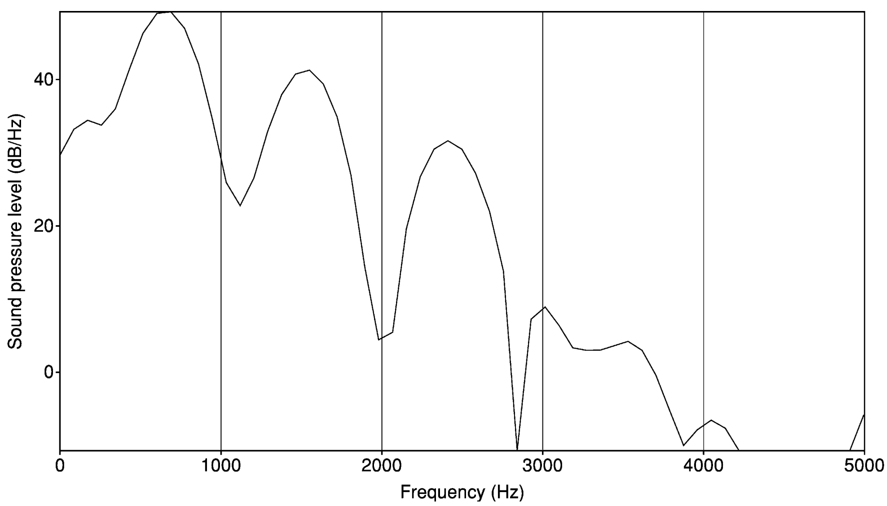

Figure 5 Spectrum of a 5-ms window centered at the arrow in **Figure 3**.

in Figure 4 shows that the formant transitions track the articulatory movements from [ɔ] to [ɹ] to [i] much more noticeably than the subtler changes in the shape of individual periods in the waveform in Figure 2.

The spectrograms in Figures 3 and 4 were produced by computing a fast-Fourier transform (FFT) of successive 5-ms windows of the utterance. A single FFT for just one 5-ms window is displayed in Figure 5. This display is called a 'spectrum,' and it plots amplitude in decibels (dB) on the vertical axis against frequency along the horizontal axis. The time when this spectrum was computed is marked in Figure 3 by an arrow; it is in the middle of the vowel [æ] in the first syllable of 'laboratory.' A comparison with the spectrogram at this moment shows that the peaks in the spectrum correspond to the formants, and the valleys correspond to the frequency ranges in which no formant can be seen.

A spectrogram in which the FFTs were calculated for successive 33.3-ms windows is shown in Figure 6. What is immediately apparent is that, compared to the original spectrogram, the boundaries between successive acoustic intervals are blurred (the vertical striations corresponding to individual cycles of vocal fold vibration have also disappeared), while at the same time the amount of energy present at each frequency is registered with much greater precision. The rule is simple: the finer the temporal resolution of the spectral analysis, the coarser the frequency resolution and vice versa.

A spectrum of the same moment in the middle of the [æ] using this longer window is displayed in Figure 7; it, too, shows the differences in energy levels at each

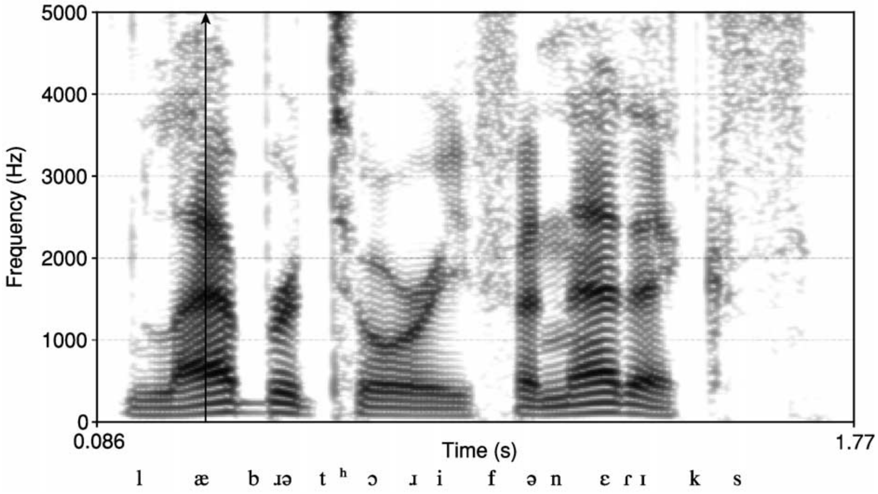

Figure 6 Spectrogram of the phrase 'laboratory phonetics' where the analysis window is 33.3 ms wide. The arrow marks the center of the window for the spectrum in **Figure 7**.

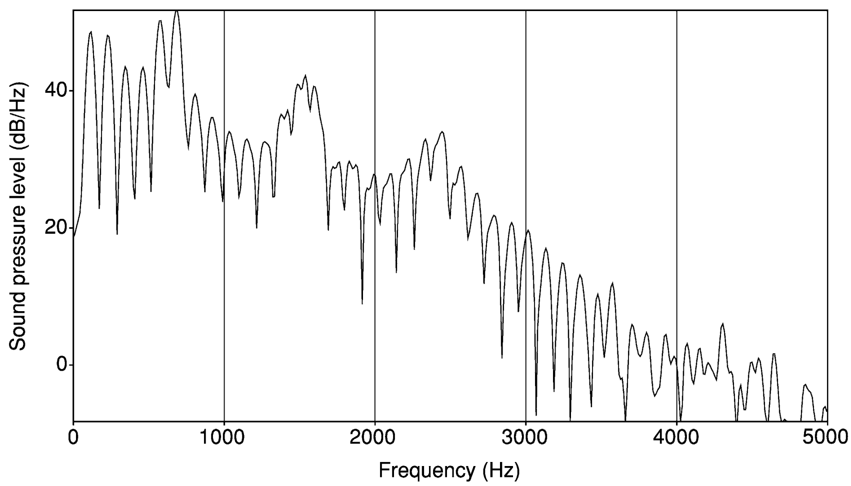

Figure 7 Spectrum of a 33.3-ms window centered at the arrow in **Figure 6**.

frequency much more precisely than did the spectrum in Figure 5. Indeed, the frequency resolution is now fine enough that the individual harmonics of the voice source are separated from one another. In the new spectrogram, the frequencies of the harmonics can be seen to rise and fall with the prosody of the utterance, peaking on the primary stressed syllables and falling to lower values elsewhere (the phrase was spoken with more or less equal prominence on both words). Even so, the coarser image of the energy distribution across frequencies can still be seen easily in the new spectrogram and spectrum. These displays make plain, then, the distinction between source and filter: the frequencies of the harmonics reflect the rise and fall in the voice source's fundamental frequency across the utterance, while their amplitudes reflect the strength of the resonant response of the air in the oral and nasal cavities at each moment in the utterance. The new spectrogram and spectrum show that a formant is produced when the resonant response of the air in the vocal tract amplifies a number of adjacent harmonics.

The spectrograms in Figures 3 and 6 correspond to what are traditionally called 'wide-' and 'narrow-band' spectrograms, so called because the wide-band spectrograms were traditionally made by measuring energy levels in successive 300-Hz-wide windows across the range of frequencies, while narrow-band spectrograms were made using a frequency window that was just 45 Hz wide. The ratio of these frequencies (6.667) is the inverse of the ratio of durations of the time windows (0.15) used in computing the spectrograms and spectra in the figures; thus, the finer the frequency resolution, the coarser the temporal resolution. Spectrograms were traditionally made using a 'spectrograph,' a device that moved filters of one or the other of these widths continuously from the bottom to the top of the frequency range of interest. The energy level within the filters at each successive frequency was transformed into a voltage, whose level determined how dark a mark was burned onto specially treated paper.

Because the harmonics of the voice's fundamental frequency (F0) are resolved in the narrow-band spectrogram, it can be used to measure how fast the vocal folds are vibrating at any moment in the utterance. But this is only one of a myriad of ways in which F0 can be measured; Hess (1983) provided a comprehensive review and evaluation of pitch extraction algorithms. The result of applying one of them – the very widely used auto-correlation method – to the utterance 'laboratory phonetics' is displayed in Figure 8. The other acoustic measure of interest is 'amplitude,' which is calculated by integrating the pressure or intensity values within successive time windows. Its time-varying values for this utterance are displayed in Figure 9.

Formant frequency values could be estimated by eye from the spectrogram in Figure 3; the wide-band spectrogram is most suitable for this purpose because it does not separate the harmonics that are amplified by the air's resonant response. However, it is often desirable to calculate these values automatically. The most widely used method for calculating them is 'linear predictive coding' (LPC) (Markel and Gray, 1976). This method predicts the next value of the signal as the weighted linear combination of some number of preceding values. The weights are chosen so that the difference between the predicted and observed signal value is as small as possible. Their values are the coefficients of a filter that would produce the observed spectrum at that moment in time when applied to a source of known characteristics – a pulse

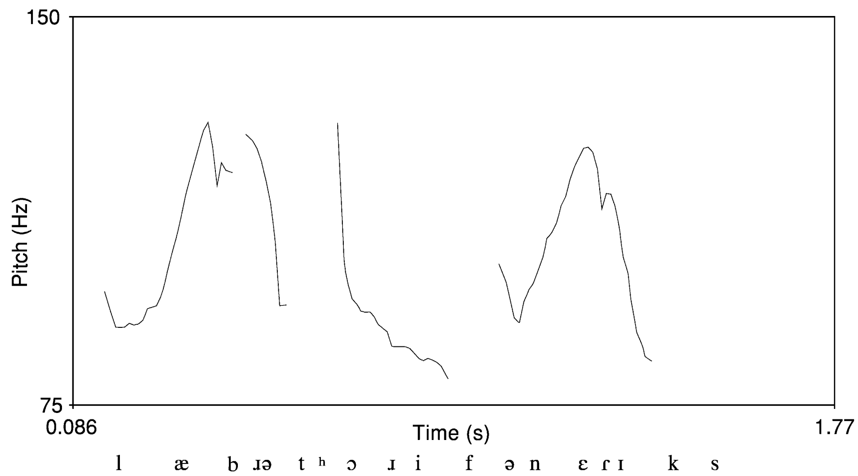

Figure 8 F0 contour of the phrase 'laboratory phonetics.'

train for periodic (voiced) stretches of the signal and broad-band noise for aperiodic (voiceless) stretches. In other words, the filter models the effects of the vocal tract's resonant response to the energy in the sound source. Because the filter is assumed to specify only the frequencies at which the resonant response amplifies energy in the source, i.e., poles, it estimates the frequencies of the peaks in the spectrum that are candidates to be formants. The number of coefficients chosen determines the number of peaks, and thus the number of formants estimated; their number should generally be greater than twice the number of peaks one wants to find. Because the next signal value is predicted from previous values, this method captures the relatively continuous change in formant frequency values. Estimates of formant frequencies using this method have been superimposed on the formants in the spectrogram of the stretch [læbɹə] from 'laboratory' in Figure 10.

Because LPC predicts the next signal value from the previous signal values, and it does so compactly by decomposing the signal into a filter and source, it is an efficient means of compressing the speech signal for transmission across a channels where a low bit-rate is desirable. For example, it is used in the Global System for Mobile Communication (GSM) standard for voice compression in mobile telephony. After the decomposed signal is transmitted, the original signal

is resynthesized by applying the filter to the source. The resynthesized rendition typically matches the original very closely. Because the signal is decomposed into filter and source characteristics, LPC resynthesis is often used to study the perceptual effects of changing the properties of one of these components while leaving the other unchanged. For example, the F0 values of the source can be changed while leaving the formant frequencies of the filter unchanged to study the perception of intonation in utterances composed of the same consonants and vowels.

Peripheral Auditory Activity

Once the acoustic signal reaches the ear, it is transduced in a series of steps from pressure variation in the air into the firing of neurons. The varying air pressure first moves the eardrum, then the middle ear bones, the inner ear fluid, the basilar membrane, and finally the hair cells sitting atop the basilar membrane. The stereocilia sticking out of the tops of the hair cells are disturbed by their movements, and that disturbance releases neurotransmitter at the synapse between the hair cells and auditory nerve neurons, causing those neurons to fire. The response to sound is then transmitted via the successive firing of neurons in brainstem nuclei, the inferior colliculus, and the thalamus, up to the auditory cortex. The specific effects of speech sounds on the mechanical stages of transduction, between movement of the eardrum and of the basilar membrane and the hair cells atop of it, have not been studied, but there have been many investigations of how the acoustic properties of speech sounds are represented in the firing patterns of neurons, particularly those in the auditory nerve (Delgutte, 1997). Because these firing patterns are measured by inserting electrodes directly into auditory nerve fibers, none of this work has been done in humans; instead, nonhuman species have been used whose auditory system's characteristics are more or less similar to that of humans, e.g., cats, chinchillas, and guinea pigs. The acoustic properties of the signal are dramatically transformed by their transduction into neuron firing in ways that could profoundly influence the perception of speech sounds, and the probable perceptual effects of these auditory transformations has been used to explain, for example, why vowels are distributed in some ways but not others in the vowel space (Lindblom, 1986) and how stops differing in voice-onset time are categorized (Kluender *et al.,* 1995; cf. Lotto and Kluender, 2002).

Central Nervous System Activity

Activity in the cortical areas of the brain has also been recorded during speech production and perception tasks using electroencephalography (EEG), magnetic encephalography (MEG), positron emission tomography (PET), and functional MRI (fMRI) (Phillips *et al.,* 2000; Phillips, 2001; Gandour *et al.,* 2002, 2003; Guenther, 2003; Guenther and Perkell, 2004). Electroencephalography records voltages at the scalp that reflect parallel currents flowing through large numbers of active neurons, while MEG records the magnetic fields generated by these current flows. The two methods have equally good temporal resolution, on the order of a millisecond or less, but they differ in the location along the cortical surface which produce the strongest signals: changes in voltage are greatest in the direction of current flow, while changes in magnetic field strength are greatest perpendicular to current flow. Electroencephalography is thus most sensitive to radial currents in the gyri, while MEG is most sensitive to such currents in the sulci. The currents that generate these fields are harder to locate in the brain with EEG than MEG, where their location can be determined within a volume equivalent to that of a cube with 5-mm sides. To keep the task of locating the currents mathematically tractable, algorithms assume that just one current is responsible for the observed fields. Because the other measurement techniques often show brain activity in multiple sites, this assumption is a gross simplification.

The other two techniques, PET and fMRI, can locate the site(s) of brain activity with much greater precision because they directly measure changes in blood supply to brain sites as their activity levels changes. As its name indicates, PET measures the emission of positrons. The positrons are emitted by radioactive tracers introduced into the blood by injection or inhalation. As the blood supply increases to a site in the brain when the neurons in that site become more active, more positrons are emitted from more active brain regions. Functional MRI also measures increases in blood flow to more active brain regions, but does so by assessing contrasts between brain sites in the extent to which the iron in hemoglobin is polarized by a strong magnetic field. Because the iron in deoxygenated hemoglobin is much more susceptible to polarization than that in oxygenated hemoglobin, such a contrast will be observed between the predominantly oxygenated blood in the arterioles on one side of a capillary bed and the predominantly deoxygenated blood in the venules on the other side. This contrast will be greater in an active brain region because the arterioles dilate to supply more oxygenated blood to more active regions. The spatial resolution of PET and fMRI is exceptionally good: differences in the numbers of positrons emitted or in magnetic contrast can be detected between volumes as small as a cube with

1 mm sides. However, temporal resolution is relatively poor because changes in blood flow take place over seconds rather than milliseconds.

Speech Synthesis

The first working speech synthesizer was built by Wolfgang von Kempelen. As described in his book, *Mechanismus der menschlichen Sprache nebst Beschreibung einer sprechenden Maschine* (1791), this mechanical device used a bellows to drive air either past an oscillating reed to simulate voiced sounds or through a shunt into the mouth chamber to simulate voiceless ones. The airflow was directed through whistles to simulate different fricative noises. Resonance frequencies were manipulated by covering the opening of the mouth or nose. After some practice, it was possible to produce quite intelligible words and even short sentences with this device.

However, the naturalness of the speech produced by this device cannot compare to that of the many instances of synthetic speech that most of us encounter regularly in the course of our daily lives, for example, when calling directory assistance, booking flights, or listening to announcements in train stations and airports. This naturalness derives only in part from the extensive use of speech synthesizers in laboratory studies of speech perception; the rest comes from a technique widely used in the construction of commercial speech synthesizers: concatenation of demisyllables. (The following account of demisyllable synthesis is greatly simplified.) Naturally produced syllables are divided into initial and final demisyllables. Initial demisyllables consist of the syllable's initial consonant(s), if any, and the transition into the vowel, and final demisyllables consist of the transition from the vowel into the syllable's final consonant(s), if any. Because the transitions between consonants and vowels contain much of the contextual variation between adjacent segments, this variation is encoded directly in the demisyllables and need not be implemented through adjustments of individual consonants and vowels. This solution to the fluent and intelligible synthesis of segment strings has permitted the developers of commercial speech synthesizers to concentrate their research efforts on the other property that bolsters naturalness and intelligibility: prosody. For this reason, demisyllable synthesis is also often used in laboratory studies of the perception of prosody.

Otherwise, most of the synthesizers used in the laboratory are of the type called 'terminal analogue' synthesizers, so called because the user directly manipulates the acoustic properties of the sound source and filter rather than the articulations that determine those acoustic properties. Early synthesizers of this type, e.g., the Pattern Playback developed by Frank Cooper at Haskins Laboratories and the OVE developed by Gunnar Fant at the Royal Institute of Technology in Stockholm, pass an electronic sound source through a filter consisting of parallel resonating circuits. The other, less commonly used method is so-called 'transmission line analogue' synthesis, in which the filter consists of a cascading series of circuits, each representing the cross-sectional area of a short section of the vocal tract. A transmission line analogue synthesizer is thus the first step toward true articulatory synthesis, in which articulators' movements and positions are simulated and their effects on the vocal tract's cross-sectional area are input to the synthesizer for transformation into resonance frequencies and bandwidths. In the last three decades, computer software has replaced electronics in both kinds of synthesizers.

Speech Recognition

If the goal of speech synthesis is to produce an utterance that sounds so natural that the listener thinks it was produced by a human rather than a machine, the goal of speech recognition is recognize the content of naturally produced speech with the same speed and skill that a human can. Successful speech recognition must overcome three very difficult challenges: different speakers' pronunciations of the same utterances differ from one another, words' pronunciations differ between contexts, and speech is often produced in the context of other speech and environmental noises. So far, no speech recognizer has successfully met all three challenges at once.

The vast majority of approaches to speech recognition use statistical pattern recognition and rely on 'hidden Markov models' (HMMs). In a Markov process, the current state depends only on previous states, and the probabilities of a transition from any previous state to the current state are fixed. The Markov model is 'hidden' when the observable states correspond to a hidden Markov process. In the application of HMMs to speech recognition, the observable states are a particular pronunciation of a word, usually encoded as a sequence of spectra, and the hidden Markov process is the speaker's intended sequence of phonemes or articulations for that word. A word is recognized based on the fixed probability that a particular observable state will occur given a particular state in the hidden model.

In principle, speech recognizers could be very useful in laboratory phonetics for explicit and precise testing of hypotheses about humans' recognition of phonemes and words. In practice, however, they have been little used for this purpose, even though phoneme and word recognition by humans is widely

acknowledged to be in part a probabilistic mapping of observable states to hidden processes, i.e., from pronunciations to stored forms. There are two reasons why such recognizers have not been used much to model humans' recognition behavior. First, phoneme and word recognition is only in part a probabilistic mapping, and there is considerable evidence that many of the hidden processes are not Markovian – they are categorical rather than probabilistic. Second, the acoustic properties that are known to influence perception are various in nature and are not easily represented as a series of spectra or any other single acoustic form.

Persistent Issues and Widely Used Experimental Techniques

In this section, a number of central problems in phonetics are described that have remained unsolved, along with the experimental techniques phoneticians have used in wrestling with them, to convey some idea of what kind of work one might see going on in present-day phonetics laboratories. The list is necessarily incomplete, but it nonetheless covers a wide range of problems.

Analysis by Synthesis

The field phonetician was described above as listening carefully to an utterance and then trying to imitate it as closely as possible. Because the phonetician knows, with some precision, how he or she pronounced the imitation, then he or she can infer that the original utterance was pronounced in the same way if the speaker accepts the imitation as accurate. A great deal of research by laboratory phoneticians uses an entirely parallel technique, called 'analysis by synthesis,' where a particular phonetic phenomenon is analyzed by attempting to synthesize it accurately. Because the workings of the synthesizer are known at least as precisely as the phonetician knows the workings of his or her vocal tract, the laboratory phonetician can also infer that the same processes produced the observed phonetic phenomenon if it is synthesized accurately. The motor theory of speech perception (Liberman *et al.*, 1967; Liberman and Mattingly, 1985, 1989) takes this approach to the point of treating it as the means that human listeners use to recognize speech sounds; they do so by simulating the articulations that would produce the acoustic properties they hear.

Another, more general use of analysis by synthesis exists in the development of quantitative models of the transformation from articulations to acoustics. The most influential of these analysis-by-synthesis models has been that developed in Fant's *An acoustic theory of speech production* (1960). Fant used radiographs of a Russian speaker pronouncing the vowels and consonants of this language to determine what the articulatory targets were for each of these sounds. The target for each sound was represented as an 'area function,' which specifies how much the oral cavity is expanded or constricted at each of a number of closely spaced locations along its length. These area functions were then put into a transmission line analogue speech synthesizer, which produced the resonance frequencies corresponding to that area function. This is analysis by synthesis, because the correctness of the articulatory configuration represented by an area function is tested by how closely the synthesizer's acoustic output matches the acoustics of the original sound. This model and its descendants (see Stevens, 1998, particularly) have since been very widely used in investigating the transformation of articulations into acoustics.

Perturbation of Articulations and Feedback

How can one begin to understand what speakers are doing when speaking fluently? Multiple articulators move continuously, tracing intricate patterns. A common answer has been to perturb the articulations in some way and observe the result. For example, bite blocks have been inserted between the teeth to remove the contribution of jaw movement to raising the tongue, and loads have been added to the lower lip to inhibit its raising toward the upper lip in closing the lips (Lindblom *et al.,* 1979; Kelso and Tuller, 1983; Abbs *et al.,* 1984). So long as the perturbation is not too extreme, speakers immediately and successfully shrug it off, i.e., they raise the tongue more independently of the jaw when the bite block prevents them from raising the jaw, and they exert more force to raise the lower lip to overcome the load and lower the upper lip more. These findings not only show what speakers' articulatory goals are but also show that they are capable of reaching those goals in more than one way, each of which is 'motor equivalent' to the others (Kelso *et al.,* 1984; Guenther, 1994). In retrospect, this outcome is unsurprising, because speakers must be capable of reaching a particular articulatory target in the context of any of the articulatory positions that can naturally precede and follow that target.

Recently, a number of studies have examined the effect of perturbing the acoustic feedback that a speaker receives about the sounds he or she has produced (Houde and Jordan, 1998; Jones and Munhall, 2002, 2003); the perturbations are introduced gradually in small, undetectable steps. Speakers adjust their pronunciations to compensate for these perturbations in feedback, just as they do to

perturbations of their articulations. A striking finding in these studies is that compensatory shifts in articulations persist for a considerable time after the perturbations cease – typically many minutes.

Invariance and Variability

Perhaps the most fundamental problem in laboratory phonetics is variability. At some level of description, both the speaker's articulatory goal in pronouncing a particular speech sound and the listener's perception of that pronunciation do not vary with context. For example, the speaker intends to pronounce the same consonant at the beginnings of the words *key* and *coo*, the voiceless velar stop /k/, and the listener perceives that speaker has done so. However, /k/'s pronunciations differ enormously between these two contexts, being far more forward on the palate before the front vowel in *key* than before the back vowel in *coo*, and the acoustics differ comparably. This example of articulatory and acoustic variability is by no means extreme, but instead typical. This example also shows that the targets speakers reach, as well as the paths their articulators follow to reach them, vary enormously if systematically as a function of a potentially very large number of flanking articulatory positions. Each of these many articulatory variants produces a corresponding acoustic variant, which the listener must somehow decode. If the speaker is trying to pronounce one of a small number of different phonemes (or distinctive feature values), which the listener is in turn trying to recognize, then this variation is a serious learning challenge to both of them. Skilled speakers have learned which combinations of articulatory movements are motor equivalent and choose the appropriate one for the current context, but how did they learn to do so? Similarly, skilled listeners have learned how context alters the intended phoneme's acoustics and adjust their criteria for evaluating those acoustics appropriately – but again, how have they learned to do so?

A number of attempts have been made to show that both articulations and acoustics are less variable than they appear. For example, when speakers pronounce vowels and consonants such as [u, ʃ] that require simultaneous articulations with the tongue and the lips, they produce less extreme lingual articulations when the labial articulation is more extreme and vice versa (Perkell *et al.,* 1993, 1998; see also Guenther *et al.,* 1999 for evidence of articulatory tradeoffs in the pronunciation of [ɹ]). This tradeoff is apparently another instance of motor equivalence, but involving entirely independent articulators. What is equivalent, moreover, is the length of the resonating cavity between the two articulations, or perhaps the acoustic product of that resonating cavity, both of which vary far less than they would if these articulations did not trade off in this way. Articulatory phonology (Browman and Goldstein, 1989, 1990, 1992) embodies a more general attempt to show that articulations are actually invariant. This theory proposes that the invariant components of utterances are not abstract feature values but instead concrete gestures that specify the location and degree of constrictions in the vocal tract. Gestures overlap with one another, so a separate component – the 'task dynamics' – is needed in the model to resolve the potentially competing demands of simultaneous gestures (Saltzman and Munhall, 1989). The actual realization of a gesture varies depending on what other gestures it overlaps with, but the gesture's presence in the utterance remains unchanged.

Acoustic invariance has been found for place of articulation in the spectral distribution of energy in the noise bursts that occur when a stop consonant is released (Stevens and Blumstein, 1978; Blumstein and Stevens, 1979, 1980) and in the relationship between the second formant's value at the onset of the transition into a vowel and its value at the vowel's steady state (Sussman *et al.,* 1991). Both measures are acoustically invariant enough that a phonetician can use them to identify the place of articulation correctly in the vast majority of tokens. However, the evidence that listeners use these acoustic invariants is weak: when the information about place of articulation in the noise burst spectra competes with that in formant transitions, which are variable with context rather than invariant, the formant transitions nearly always determine the perceived place (Walley and Carrell, 1983; Smits *et al.,* 1996a, 1996b), and the third formant must begin at a frequency specific to a particular place of articulation, if listeners are to use the relationship between the second formant's frequencies at the transition onset and vowel steady state to identify that place of articulation (Fruchter and Sussman, 1997).

Segmentation and Coarticulation

In the earlier discussion of the acoustic analysis of the phrase 'laboratory phonetics,' both the waveform and the spectrogram were divided up into a number of acoustic segments using more or less obvious visible discontinuities in the displays that corresponded to more or less dramatic acoustic discontinuities in the signal. These segments were, moreover, labeled with symbols that represent the phonemes of which the speaker's message is composed, annotated in some instances to show details of their pronunciation, e.g., the superscript ^{h} that indicates that the /t/ in 'laboratory' is aspirated. However, it is well known that the articulations that realize these phonemes

do not begin and end within the acoustic segments labeled with those symbols. Instead, they begin before (sometimes well before) those segments and end after (sometimes long after) them, i.e., they begin and end within acoustic segments that are labeled with adjacent symbols and that realize adjacent phonemes. Because the articulations of adjacent phonemes overlap or coarticulate with one another, sometimes quite extensively, it is not possible to attribute the acoustic properties of any acoustic segment to a single phoneme's pronunciation. This coarticulation and its acoustic effects are among the principal if systematic sources of the variation in speech; others are differences between speakers and differences between faster and slower speech or between hypo- and hyperarticulated speech.

Categorization and Discrimination

In the vast majority of studies of speech perception, listeners are presented with members of a continuum that differ incrementally from one extreme to another in some acoustic property that is hypothesized to distinguish one phoneme or distinctive feature value from another. The listeners' task is to assign the stimuli to one or the other of a small number of categories, which usually correspond to minimally contrasting phonemes in their native language. For example, listeners might be presented with a series of stops increasing incrementally in the onset frequency of the second formant (F2) and have to categorize them as 'b' versus 'g' (Figure 11a). Figure 12a shows typical results: listeners identify the stimuli at one end of the continuum (stimuli 0 to 1) as one category, here 'b,' and those at the other end (5 to 6) as the other, 'g,' and they cross over from hearing one category to hearing the other within a relatively narrow portion of the continuum (2 to 4). In addition to this identification task, listeners may also be presented with pairs of identical or adjacent stimuli from the continuum and asked whether they are the same or different to measure the extent to which they can discriminate stimuli that differ by a small amount in their values for the acoustic property. If the stimuli are categorized in the way they are in Figure 12a, then discrimination is typically poor (but unlike in the figure detectably above chance) for stimuli that are labeled the same and much better for those that are labeled differently (Figure 12b). Dimensions like F2 onset frequency, where the listeners' ability to discriminate two stimuli depends on the extent to which they label them differently, are described as being 'categorically' perceived.

A quite different pattern of categorization and discrimination responses is obtained for dimensions of simple nonspeech sounds, such as the frequency of a tone. When asked to categorize tones differing in frequency as having 'low' versus 'high' pitch, listeners' 'low' judgments decrease gradually rather than abruptly with frequency (Figure 12c), and when asked to discriminate identical or adjacent stimuli, they are more or less equally good across the range (Figure 12d). This pattern of results is described as 'continuous' perception.

Discrimination performance declines modestly at the high end of the continuum for continua such as the pitch of a tone because it is more difficult to distinguish sounds that differ by a fixed amount when both of their values are high than when they are both low. This effect of stimulus level on discrimination is so general that it has been codified as Weber's Law: the just noticeable difference (jnd) between two stimuli is proportional to the mean of their values for the dimension being discriminated. Discrimination is quite good for the stimulus pairs at the low end of the continuum in Figure 12d, because the difference in pitch between them is much greater than a jnd, but discrimination declines for pairs toward the high end, because this fixed difference gets closer and closer to the jnd. Weber's Law effects are such a general finding in discrimination tasks that failing to find then in the discrimination of categorically perceived dimensions such as F2 onset frequency is particularly surprising.

Even more surprising is the finding that F2 onset frequency is continuously rather than categorically perceived when the F2 transition is presented separately from the rest of the syllable (see the spectrograms of such stimuli in Figure 11b; see also Mattingly *et al.,* 1971). When presented alone, the F2 transition no longer conveys information about place of articulation; indeed, it no longer sounds like speech but instead like a nonspeech chirp or quack. This finding led to the proposal that categorical perception is a special property of humans' responses to acoustic dimensions that distinguish speech sounds from one another (Liberman *et al.,* 1967; Liberman and Mattingly, 1989). The proponents of this view are also the proponents of the motor theory of speech perception. Speech sounds are the only sounds that are perceived categorically because only they are perceived by simulating their production, and they are produced with categorically distinct and largely invariant articulations. However, nonhuman listeners perceive speech dimensions as categorically as humans do (Kuhl and Miller, 1978), and stimuli whose acoustic properties vary like analogous speech sounds but that are not recognized as speech – so-called 'nonspeech analogues' – can be perceived as categorically as speech (Pisoni, 1977; Parker *et al.,* 1986). Moreover, the articulation of particular speech sounds is

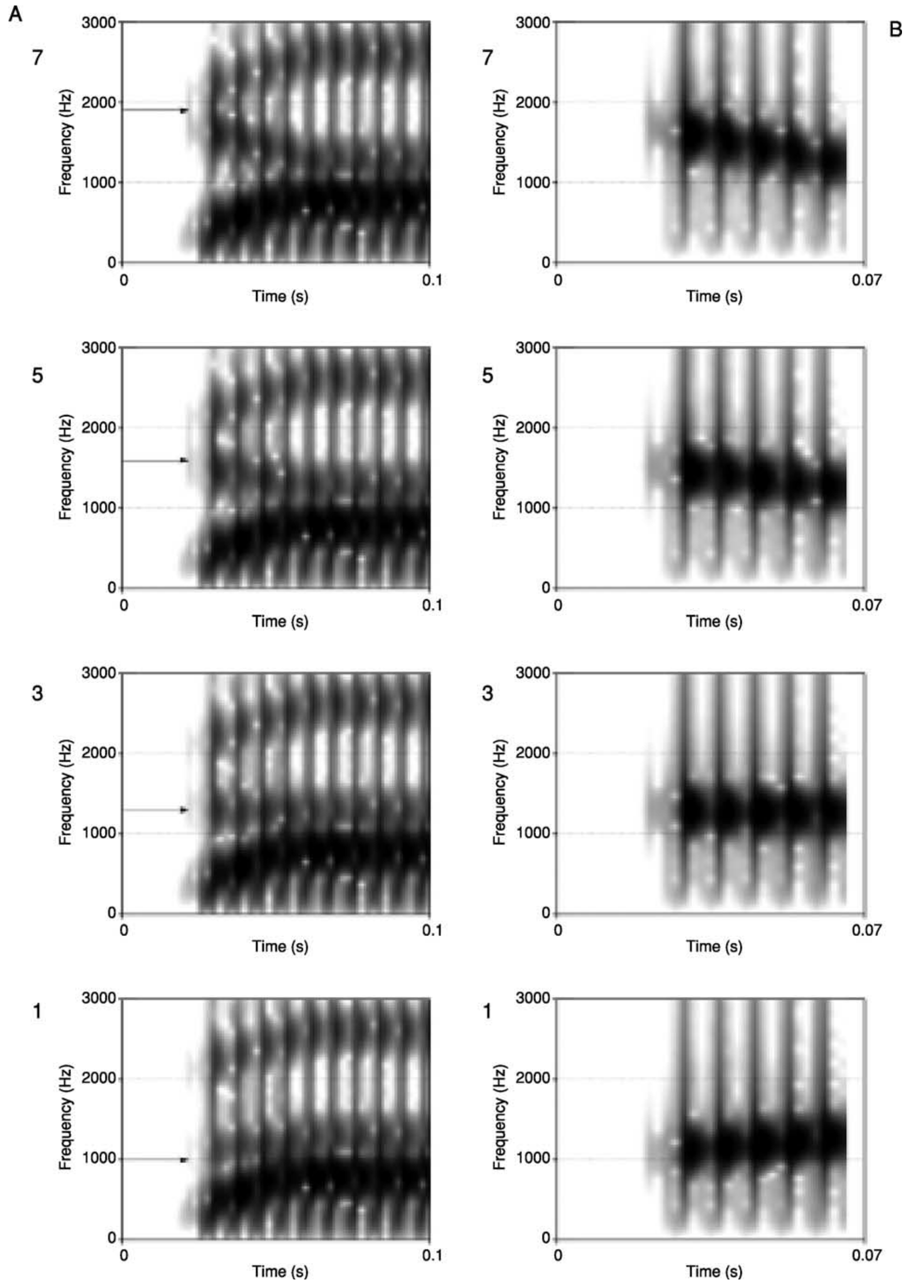

Figure 11 (A) Spectrograms of the first 100 ms of steps 1 (*bottom*), 3, 5, and 7 (*top*) in a seven-step [ba] to [ga] continuum synthesized by varying only the onset frequency of the second formant (F2). The arrows point to the onsets of F2 at 1000 (*bottom*), 1300, 1600, and 1900 Hz. (B) Spectrograms of just the F2 transitions alone.

not invariant with context, even at the level of muscle activity (MacNeilage, 1970). These findings have led others to propose that speech sounds are perceived using general auditory mechanisms rather than speech-specific ones (Diehl and Kluender, 1989).

This debate remains unresolved and now extends to evidence from studies of trading relations, i.e., the change in the perceptual value of one acoustic property by the value of another independently varied property (Repp, 1982; Parker *et al.,* 1986) and of duplex perception, i.e., simultaneous speech and non-speech percepts when the acoustic properties of a syllable are divided between the two ears (Liberman and Mattingly, 1985, 1989; Xu *et al.,* 1997; cf. Fowler and Rosenblum, 1991). The debate has also been extended theoretically with the development of the direct realist theory of speech perception (Fowler, 1986), which claims that speech sounds are perceived

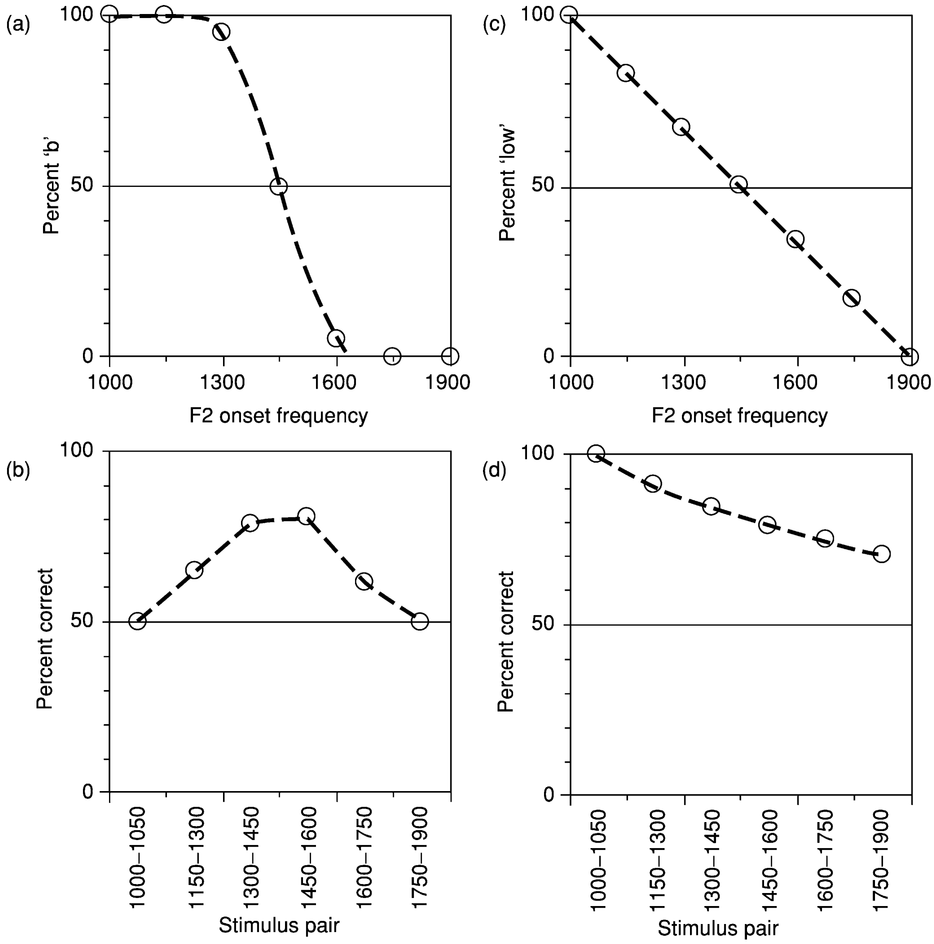

Figure 12 (a) Percent 'b' responses for categorical identification of the F2 onset continuum in Figure 11A, in judgments of place of articulation, and (b) percent correct in discrimination of adjacent stimuli from the continuum depicted in Figure 11A, – chance is 50% correct. (c) Percent 'low' responses to the frequency of a pure tone or the onset of the isolated F2 continuum depicted in Figure 11B, and (d) percent correct in discrimination of adjacent stimuli from the continuum depicted in Figure 11B. (Hypothetical data.)

no differently than other sounds – or for that matter, no differently than stimuli in other modalities: all are perceived as the events that produced them. In direct realism, speech sounds are perceived as the articulations that produce them, but unlike in the motor theory of speech perception as the actual articulations in the mouth of the speaker rather than as simulations of those articulations in the mind of the perceiver.

Phonetic Explanation and Universal Versus Language-Specific Phonetics

Many of the results of phonetic research in the laboratory have been applied very fruitfully in explaining why particular phonological patterns and sound changes recur across languages (Ohala, 1993, 1996). This application has been so fruitful because in the absence of pathology, speakers' vocal tracts and listeners' auditory apparatus work much the same way regardless of what language(s) they speak. These similarities are great enough that speakers' and listeners' phonetic behaviors are constrained in very similar ways across languages. Even so, there is also considerable evidence that speakers of different languages do not pronounce what would appear to be the same phonological categories identically, and these differences, too, may contribute to explanations of sound patterns (Keating *et al.*, 1983; Kingston and Diehl, 1994; Ladefoged and Maddieson, 1996). Until the phonetics of a much greater number of languages are thoroughly documented through careful instrumental analyses of the kinds described in this entry, it will not be possible to determine what the limits are on language-specific phonetic behavior or how far universal constraints imposed by the working of the speaking and listening apparatus extend.

Influence of Types of Linguistic Knowledge on Speech Sound Perception

Finally, in the last two decades there have been many studies of the ways in which listeners' linguistic knowledge affects their perception of speech sounds. Studies of infant listeners have shown that early in the first year of life they are capable of discriminating any sounds that a language might use to distinguish one message from another, but as they approach their first birthday, they gradually lose the ability to discriminate any sounds other than those that contrast in the ambient language (Werker and Tees, 1984; Werker and Lalonde, 1988). Infants show evidence of knowing something about the prosody of the ambient language even earlier: neonates no more than 48 hours old are capable of discriminating their mother's language (not necessarily spoken by her) from a rhythmically different language (Mehler *et al.,* 1988; Nazzi *et al.,* 1998). This ability probably arises from the neonates' having heard the rhythm of their mothers' speech transmitted through her body into the uterus, although premature neonates born as early as 7 months' gestation can also make this distinction, despite having just developed a functioning auditory apparatus (Dehaene-Lambertz, 1998). The effects of linguistic experience increasingly constrain both the speaker's ability to pronounce the sounds of another language and the listener's ability to identify them as the person matures. Even by the time a person reaches his or her fifth birthday, he or she may no longer be able to learn to pronounce or perceive the sounds of another language natively (Pallier *et al.,* 1997).

Mature listeners' perception is not only prevented from distinguishing foreign speech sounds that do not contrast in their native language, but their perception of their native language is also profoundly constrained by the kinds of knowledge they have acquired about it, of whether a particular string of sounds is a word (Ganong, 1980; Pitt and Samuel, 1993), a frequent sound sequence (Pitt and McQueen, 1998), a phonotactically legal sequence (Massaro and Cohen, 1983; Moreton, 2002), or is a word with many versus few phonologically similar neighbors (Vitevitch and Luce, 1998, 1999). The effects of this linguistic knowledge can on occasion be strong enough to produce perceptual illusions (Dupoux *et al.,* 1999) that are even reflected in the brain's earliest detectable response to speech (Dehaene-Lambertz *et al.,* 2000). There is nonetheless considerable debate among students of these effects about whether and how the initial evaluation of the incoming signal is influenced by different kinds of linguistic knowledge, with some arguing that linguistic knowledge affects processing from the outset (Elman and McClelland, 1988) and others arguing instead that linguistic knowledge only biases later decisions about what category the output of initial processing should be assigned to (Norris *et al.,* 2000; Kingston, in press).

Laboratory Speech and Synthetic Speech

Most research in laboratory phonetics uses very carefully designed materials elicited from speakers with a script to study production and equally carefully synthesized materials to study perception. Because much of this research is interested only in how a single property of the utterance is pronounced or perceived, the materials are often not even composed of words, e.g., the production or perception of voicing in intervocalic stops often uses the utterances [aba] and [apa]. Speech elicited in this way is typically very carefully articulated, and as a consequence contrasting sounds differ by large amounts in many phonetic properties. Because the phonetic differences are exhibited so extremely and profusely, this so-called 'laboratory speech' is most useful for studying how minimally contrasting sounds differ from one another. In sharp contrast, no acoustic properties other than those whose perceptual values are of interest differ in the synthetic stimuli used to study perception. This sparseness is most useful for pinpointing how an acoustic property contributes to recognizing that one category has occurred rather than another. Both laboratory speech and synthetic stimuli idealize the phonetics of an utterance and may be quite unrealistic. After all, speakers typically do not declaim their utterances with the distinctness of laboratory speech, and speech sounds in utterances that listeners typically hear differ in many acoustic properties from minimally different sounds. In an effort to study typical speech production and perception, phoneticians have begun to turn to more naturalistically pronounced speech in studying production (Docherty *et al.,* in press) and in studying perception to stimuli that differ in more than one acoustic property at a time (Kingston and Macmillan, 1995; Kingston *et al.,* 1997; Macmillan *et al.,* 1999).

Laboratory Phonology

This entry has described the problems that phoneticians study in the laboratory and the techniques and instruments they use to study them. The purpose of these studies is to discover the systematic patterns in speakers' and listeners' phonetic behavior. But, as acknowledged in the earlier discussion of speech recognition, these patterns are in large part the observable states that correspond to hidden processes, i.e., the phonological patterns of the speakers' and listeners'

language. And as also noted, the results of many studies of phonetic behavior in the laboratory have been successfully applied to explaining recurrent phonological patterns. In an effort to stimulate more investigations of the relationship or interface between phonetics and phonology, the first Laboratory Phonology Conference was held in 1987 at Ohio State University, and the ninth conference was held at the University of Illinois, Urbana-Champaign, in the summer of 2004. The proceedings from the first seven meetings have been published, and the publication of those from the eighth is imminent. As described in the introduction to the first volume (Beckman and Kingston, 1990), the purpose of the conference and proceedings is to change the research practice of both phoneticians and phonologists: to induce phoneticians to test hypotheses about phonetic behavior arising from explicit phonological analyses, and to induce phonologists to recognize that acceptance of a phonological analysis depends on experimentally confirming its predictions about phonetic behavior.

Labov, William (b. 1927)

D Stein, Heinrich-Heine-Universitaet Duesseldorf, Duesseldorf, Germany

Similar to several other linguists, William Labov started out in the natural sciences, as a chemist, before turning into a linguist. He studied and taught at Columbia University (1961) before becoming professor of linguistics at the University of Pennsylvania in 1970. He is considered the founder of modern sociolinguistics, initiating a paradigm of studying variation and change that has been termed 'correlative,' in that it establishes systematic correlations between social categories like class, age, sex, ethnicity, and style as independent variables, and the frequency of variants of (mostly phonological) variables as dependent variables. Apart from now widely applied concepts of variational analysis such as the 'linguistic variable' or his notion of 'style,' Labov's main early theoretical contribution may be seen in the demonstration of the structuredness of linguistic variation against the backdrop of generative disregard of performance as of less interest for the study of language. Labov is also to be credited with the first major study of urban dialects (those of New York City) and for developing a specific methodology of structured interviews of random samples of groups of speakers, which are taken to be representative both for the members of the whole group and, more implicitly, for the individual. His paradigm-setting methodology has been widely adopted for the analysis of other varieties of English and other languages. It was above all the discovery of age-based differences in the use of variants that led to insights into the micromechanisms of present-day linguistic change (Weinreich *et al.*, 1968) and was then extended into the analysis of disputed cases of historical change, such as the English Great Vowel Shift. Labov's work on variation, although focused on phonological change, was also extended into other areas, such as semantic and morphosyntactic variation. Among his major contributions to the study of diffusion patterns in linguistic change processes is the discovery that women are consistently at the forefront of changes involving social prestige, whereas men lead the way in changes motivated by 'covert prestige.'

Another focus of Labov's work concerns educational issues arising from the study of ethnic urban dialects such as African American Vernacular English, centering on grammatical differences between standard English and vernacular grammar. Labov identified

Labov, William (b. 1927)

D Stein, Heinrich-Heine-Universitaet Duesseldorf, Duesseldorf, Germany

Similar to several other linguists, William Labov started out in the natural sciences, as a chemist, before turning into a linguist. He studied and taught at Columbia University (1961) before becoming professor of linguistics at the University of Pennsylvania in 1970. He is considered the founder of modern sociolinguistics, initiating a paradigm of studying variation and change that has been termed 'correlative,' in that it establishes systematic correlations between social categories like class, age, sex, ethnicity, and style as independent variables, and the frequency of variants of (mostly phonological) variables as dependent variables. Apart from now widely applied concepts of variational analysis such as the 'linguistic variable' or his notion of 'style,' Labov's main early theoretical contribution may be seen in the demonstration of the structuredness of linguistic variation against the backdrop of generative disregard of performance as of less interest for the study of language. Labov is also to be credited with the first major study of urban dialects (those of New York City) and for developing a specific methodology of structured interviews of random samples of groups of speakers, which are taken to be representative both for the members of the whole group and, more implicitly, for the individual. His paradigm-setting methodology has been widely adopted for the analysis of other varieties of English and other languages. It was above all the discovery of age-based differences in the use of variants that led to insights into the micromechanisms of present-day linguistic change (Weinreich *et al.*, 1968) and was then extended into the analysis of disputed cases of historical change, such as the English Great Vowel Shift. Labov's work on variation, although focused on phonological change, was also extended into other areas, such as semantic and morphosyntactic variation. Among his major contributions to the study of diffusion patterns in linguistic change processes is the discovery that women are consistently at the forefront of changes involving social prestige, whereas men lead the way in changes motivated by 'covert prestige.'

Another focus of Labov's work concerns educational issues arising from the study of ethnic urban dialects such as African American Vernacular English, centering on grammatical differences between standard English and vernacular grammar. Labov identified

local social group identity as a major force in explaining the absence of patterns of convergence toward the prestige standard norm. In addition, he stressed the coexistence of two equally functional but separate systems and debunked the claim that the nonstandard system was deficient in comparison to the standard system. He related the educational failure of these groups to the fact that the educational system did not take into account the difference in the systems and to the existence of a nonstandard value system that existed in opposition to that of the school, as part of local group identity. Labov attributed an even stronger effect on educational failure to the existence of negative attitudes toward nonstandard language.

Labov's more recent work continues the orientation toward urban dialectology and change as embodied in the *Atlas of North American English*, conceptualizing the pattern of phonological change observed in a notion of 'cascading' (i.e., moving in cohortal fashion from the largest city to the respective next-largest ones). The sorting out of the role of the sexes has been one of his most important contributions (cf. his extremely important article published in *Language Variation and Change*.) This attention to the role of gender in change permeates his work.

Lacan, Jacques (1901–1981)

M Bednarek, University of Augsburg, Augsburg, Germany

Lacan was born in Paris in 1901, studied medicine there, and gained a Ph.D. in 1932 with a thesis on paranoia. Although he was widely influential across disciplinary boundaries (by virtue of his rereading of Freud through the lens of structural linguistics), within his own scientific community he was regarded as an *enfant terrible* and excluded from national and international psychoanalytic societies. Consequently, he founded his own school of psychoanalysis (*L'École Freudienne de Paris*). Lacan worked and lived in Paris until his death in 1981.

Influenced by Claude Lévi-Strauss's structural anthropology, Lacan adopted several ideas from Ferdinand de Saussure and Roman Jakobson in his rewriting of Sigmund Freud's theory (arguing for a 'return to Freud'), the most important essays of which were published in 1966 in the *Écrits*.

His central hypothesis is that the unconscious is structured like a language, in terms of condensation (metaphor) and displacement (metonymy). He also reinterprets Saussure's conception of the linguistic sign (*signifiant* and *signifié*), arguing that there is no stable meaning, no ultimate *signifié* that the *signifiant*

local social group identity as a major force in explaining the absence of patterns of convergence toward the prestige standard norm. In addition, he stressed the coexistence of two equally functional but separate systems and debunked the claim that the nonstandard system was deficient in comparison to the standard system. He related the educational failure of these groups to the fact that the educational system did not take into account the difference in the systems and to the existence of a nonstandard value system that existed in opposition to that of the school, as part of local group identity. Labov attributed an even stronger effect on educational failure to the existence of negative attitudes toward nonstandard language.

Labov's more recent work continues the orientation toward urban dialectology and change as embodied in the *Atlas of North American English*, conceptualizing the pattern of phonological change observed in a notion of 'cascading' (i.e., moving in cohortal fashion from the largest city to the respective next-largest ones). The sorting out of the role of the sexes has been one of his most important contributions (cf. his extremely important article published in *Language Variation and Change*.) This attention to the role of gender in change permeates his work.

Lacan, Jacques (1901–1981)

M Bednarek, University of Augsburg, Augsburg, Germany

Lacan was born in Paris in 1901, studied medicine there, and gained a Ph.D. in 1932 with a thesis on paranoia. Although he was widely influential across disciplinary boundaries (by virtue of his rereading of Freud through the lens of structural linguistics), within his own scientific community he was regarded as an *enfant terrible* and excluded from national and international psychoanalytic societies. Consequently, he founded his own school of psychoanalysis (*L'École Freudienne de Paris*). Lacan worked and lived in Paris until his death in 1981.

Influenced by Claude Lévi-Strauss's structural anthropology, Lacan adopted several ideas from Ferdinand de Saussure and Roman Jakobson in his rewriting of Sigmund Freud's theory (arguing for a 'return to Freud'), the most important essays of which were published in 1966 in the *Écrits*.

His central hypothesis is that the unconscious is structured like a language, in terms of condensation (metaphor) and displacement (metonymy). He also reinterprets Saussure's conception of the linguistic sign (*signifiant* and *signifié*), arguing that there is no stable meaning, no ultimate *signifié* that the *signifiant*

refers to. Without the existence of stable *signifiés*, the unconscious is the place of a sliding chain of *signifiants*.

Another of Lacan's well-known concepts is that of the 'mirror stage.' He suggests that the human infant is inherently fragmented and incomplete, a fact which is masked by the child's identification with its mirror image as a unified 'gestalt.' This identification process results in the formation of the self (*moi*) and causes the child's alienation from itself, the split subject. Once the child learns to use a language, it enters the Symbolic order, one of three domains of experience established by Lacan (the other two domains are the Real, where no language exists, and the Imaginary, the order of illusions). This symbolic order is regarded as the 'law' that governs the whole of man's sociocultural existence.

According to Lacan, language is also essential for any psychoanalytic exchange whose aim is to help the subject arrive at *parole pleine* ('full speech') via *parole vide* ('empty speech'), a necessary detour that enables the access of the true subject (*je*).

Although Lacan's style is very complex and idiosyncratic (and defies reading and interpretation to some extent), he had great influence, particularly on philosophy, sociology, cultural studies, and feminist theory, but also on interdisciplinary linguistic approaches such as Critical Discourse Analysis.

Ladefoged, Peter (b. 1925)

P D Fallon, Howard University, Washington, DC, USA

Peter Ladefoged is the foremost phonetician of the second half of the 20th century. Trained by David Abercrombie, Ladefoged serves as a living link between a venerable tradition of British phoneticians known for articulatorily-based description and a newer generation of analysts using computers.

Born on September 17, 1925, in Sutton, England, Ladefoged received an M.A. from the University of Edinburgh in 1951, winning the Class Medal in Phonetics. Ladefoged was lecturer in phonetics at Edinburgh from 1953 to 1959, with responsibility for the Phonetics Laboratory and for teaching experimental phonetics. He received his Ph.D. from Edinburgh in 1959. From 1961 to 1962 he was a Field Fellow in the West African Languages Survey, from which he collected material for his book (1964). Ladefoged then launched an academic career at the University of California, Los Angeles (UCLA), where he established the world-famous UCLA Phonetics Laboratory and its well-regarded UCLA Working Papers in Phonetics. Ladefoged became full professor in 1965, acting as department chair from 1977 to 1980, and has been UCLA Research Linguist/Professor of Phonetics Emeritus since 1991.

After early interests in acoustic phonetics, perceptual theories of phonetics, and work on the respiratory muscles used in speech, Ladefoged collected phonetic data on West African languages and began the lifelong task of recording and analyzing speech from little-studied languages from all inhabited continents. As Fromkin (1985: xiv) wrote, he has recorded "speech from more people speaking more languages than any other phonetician has ever done." Much of Ladefoged's work has been supported by the National Science Foundation, and the data collected has often been from endangered languages.

Laver (1991: 2) has called Ladefoged's abiding contribution "the development of a descriptive phonetic theory of spoken language whose architecture rests firmly on a foundation of empirical, objective, and quantified observation." In his 1971 work, Ladefoged tried to empirically ground phonetic features and

refers to. Without the existence of stable *signifiés*, the unconscious is the place of a sliding chain of *signifiants*.

Ladefoged, Peter (b. 1925)

P D Fallon, Howard University, Washington, DC, USA

Peter Ladefoged is the foremost phonetician of the second half of the 20th century. Trained by David Abercrombie, Ladefoged serves as a living link between a venerable tradition of British phoneticians known for articulatorily-based description and a newer generation of analysts using computers.

Born on September 17, 1925, in Sutton, England, Ladefoged received an M.A. from the University of Edinburgh in 1951, winning the Class Medal in Phonetics. Ladefoged was lecturer in phonetics at Edinburgh from 1953 to 1959, with responsibility for the Phonetics Laboratory and for teaching experimental phonetics. He received his Ph.D. from Edinburgh in 1959. From 1961 to 1962 he was a Field Fellow in the West African Languages Survey, from which he collected material for his book (1964). Ladefoged then launched an academic career at the University of California, Los Angeles (UCLA), where he established the world-famous UCLA Phonetics Laboratory and its well-regarded UCLA Working Papers in Phonetics. Ladefoged became full professor in 1965, acting as department chair from 1977 to 1980, and has been UCLA Research Linguist/Professor of Phonetics Emeritus since 1991.

After early interests in acoustic phonetics, perceptual theories of phonetics, and work on the respiratory muscles used in speech, Ladefoged collected phonetic data on West African languages and began the lifelong task of recording and analyzing speech from little-studied languages from all inhabited continents. As Fromkin (1985: xiv) wrote, he has recorded "speech from more people speaking more languages than any other phonetician has ever done." Much of Ladefoged's work has been supported by the National Science Foundation, and the data collected has often been from endangered languages.

Laver (1991: 2) has called Ladefoged's abiding contribution "the development of a descriptive phonetic theory of spoken language whose architecture rests firmly on a foundation of empirical, objective, and quantified observation." In his 1971 work, Ladefoged tried to empirically ground phonetic features and

phonetic theory in known contrasts in languages all over the world. The latest statement of this goal is the 1996 publication by Ladefoged and Maddieson.

Ladefoged is also a pedagogically effective professor. He won a Distinguished Teaching Award from UCLA in 1971, and his (1975) textbook is a classic and has trained a generation of linguists. More recent textbooks (1962 [2nd edn., 1996], 2001, 2003) incorporate new insights, techniques, and computers. In addition, Ladefoged was instrumental in making publically available a collection of sound files titled 'The Sounds of the World's Languages (now called 'UCLA Phonetic Data').'

Ladefoged has served as dissertation advisor for such prominent phoneticians as Victoria Fromkin, John Ohala, Ian Maddieson, and many others. In 1978, he served as president of the Linguistic Society of America. He was the recipient of a Gold Medal awarded at the XIIth International Congress of Phonetic Sciences in 1991, honoring his contributions to phonetics. He served as president of the International Phonetic Association and is currently an editor of its journal. Ladefoged also served as a technical consultant for George Cukor's film 'My Fair Lady,' for which he illustrated Henry Sweet's phonetic alphabet and helped equip Henry Higgins' lab.

Lado, Robert (1915–1995)

M Thomas, Boston College, Chestnut Hill, MA, USA

Robert Lado was born in Florida, but his family returned to their native Spain while he was a child. When the Spanish Civil War broke out, Lado re-immigrated to the United States at age 21. He learned English while working as a sign painter, then attended college on a scholarship. Graduating with a major in English, Lado decided on a career in teaching. In graduate school he studied with University of Michigan linguist Charles C. Fries. Lado's 1950 Ph.D. thesis was on testing the proficiency of Spanish-speaking learners of English.

Lado stayed on to work with Fries as a faculty member and administrator at Michigan's English Language Institute. The ELI trained students from abroad in English as a second language, as part of a U.S. State Department–sponsored exchange program. Fries and Lado drew on midcentury American descriptive linguistics to develop language-teaching materials and techniques they called the Oral Approach. Lado created language tests and textbooks, and wrote on testing, pedagogy, and second language acquisition. His most famous publications (Lado, 1957, 1964) introduced teachers to descriptivist procedures for analyzing a language's sound system, grammar, and vocabulary. Lado argued that as a prerequisite to effective pedagogy, a teacher needs to compare the native and target languages (and cultures).

In 1960 Lado moved to Georgetown University, first as director of an ELI-like institute, later as Dean of the School of Languages and Linguistics and founder of what became Georgetown University Press. Even after retiring from full-time teaching in 1980, Lado continued his professional activities, publishing textbooks and pedagogical manuals, establishing a commercial English-language school (Lado International College), and pursuing a new research interest in teaching reading to preschoolers. Lado's

phonetic theory in known contrasts in languages all over the world. The latest statement of this goal is the 1996 publication by Ladefoged and Maddieson.

Ladefoged is also a pedagogically effective professor. He won a Distinguished Teaching Award from UCLA in 1971, and his (1975) textbook is a classic and has trained a generation of linguists. More recent textbooks (1962 [2nd edn., 1996], 2001, 2003) incorporate new insights, techniques, and computers. In addition, Ladefoged was instrumental in making publically available a collection of sound files titled 'The Sounds of the World's Languages (now called 'UCLA Phonetic Data').'

Ladefoged has served as dissertation advisor for such prominent phoneticians as Victoria Fromkin, John Ohala, Ian Maddieson, and many others. In 1978, he served as president of the Linguistic Society of America. He was the recipient of a Gold Medal awarded at the XIIth International Congress of Phonetic Sciences in 1991, honoring his contributions to phonetics. He served as president of the International Phonetic Association and is currently an editor of its journal. Ladefoged also served as a technical consultant for George Cukor's film 'My Fair Lady,' for which he illustrated Henry Sweet's phonetic alphabet and helped equip Henry Higgins' lab.

Lado, Robert (1915–1995)

M Thomas, Boston College, Chestnut Hill, MA, USA

Robert Lado was born in Florida, but his family returned to their native Spain while he was a child. When the Spanish Civil War broke out, Lado re-immigrated to the United States at age 21. He learned English while working as a sign painter, then attended college on a scholarship. Graduating with a major in English, Lado decided on a career in teaching. In graduate school he studied with University of Michigan linguist Charles C. Fries. Lado's 1950 Ph.D. thesis was on testing the proficiency of Spanish-speaking learners of English.

Lado stayed on to work with Fries as a faculty member and administrator at Michigan's English Language Institute. The ELI trained students from abroad in English as a second language, as part of a U.S. State Department–sponsored exchange program. Fries and Lado drew on midcentury American descriptive linguistics to develop language-teaching materials and techniques they called the Oral Approach. Lado created language tests and textbooks, and wrote on testing, pedagogy, and second language acquisition. His most famous publications (Lado, 1957, 1964) introduced teachers to descriptivist procedures for analyzing a language's sound system, grammar, and vocabulary. Lado argued that as a prerequisite to effective pedagogy, a teacher needs to compare the native and target languages (and cultures).

In 1960 Lado moved to Georgetown University, first as director of an ELI-like institute, later as Dean of the School of Languages and Linguistics and founder of what became Georgetown University Press. Even after retiring from full-time teaching in 1980, Lado continued his professional activities, publishing textbooks and pedagogical manuals, establishing a commercial English-language school (Lado International College), and pursuing a new research interest in teaching reading to preschoolers. Lado's

publications (Jankowsky, 1985) include over 150 books, articles, and reviews. Rounding out a busy, creative, life, Lado and his wife Lucia raised five daughters and five sons.

With the eclipse of descriptive linguistics and its concept of second language learning, Lado is now best remembered as the author of *Linguistics across cultures*. In particular, he is represented as the architect of the 'Contrastive Analysis Hypothesis' – essentially the claim that wherever a learner's native and target languages differ, the learner will face difficulty and delay in acquiring the target language. Contrastive Analysis is typically presented (e.g., by Gass and Selinker, 2001) as a product of American descriptivism and Bloomfieldian behaviorism. Thomas (submitted) argues that this misconstrues the relationships of descriptivism, behaviorism, and Contrastive Analysis in Lado's (and Fries's) work: first, because Lado was not a behaviorist, and second, because his commitment to cross-linguistic comparison is not equivalent in extent or content to the Contrastive Analysis Hypothesis.

Lahnda

C Shackle, University of London, London, UK

The name 'Lahnda' (Panjabi *lahiṁdā* 'western'), like the more natural feminine 'Lahndi,' is an invented blanket term without local currency used to distinguish the Indo-Aryan dialects spoken in western Panjab and the adjacent regions of Pakistan (by some 30 million speakers) from the Panjabi proper native to the central and eastern districts of the Panjab. The boundary between Lahnda and Panjabi (Shackle, 2003) is anyway an uncertain one. Many common features, e.g., retained historical geminates or the possessive marker *dā*, have been reinforced by overlapping literary traditions. Since the 1990s, however, local politicocultural movements have emphasized the distinctive character of some varieties of Lahnda, and the southern Seraiki (Ser) (Saraiki) and to a lesser extent the northern Hindko (also termed Pahari or Panjistani) are beginning to be employed as independent literary languages consciously rivaling Pakistani Panjabi (Pj). Written in the Perso-Urdu script, all three incipient standards are considerably influenced by Urdu.

Siraiki

The rather homogeneous southwestern Seraiki dialects (Shackle, 1976) are notably distinguished from Panjabi by the retention of historical aspiration and the development of four implosive phonemes /ɠ, ʄ, ᶑ, ɓ/, shared with Sindhi, thus Sanskrit *baddha-* 'bound' > Pj /bə´dda/ but Ser /' ɓəddha/, Sindhi /' ɓədho/.

Distinctive Seraiki morphological features include the passive extension /-'i-/ and the sigmatic future, with stressed extension of transitive stems, e.g., Ser /kə'resi/ 'will do', passive /kə'risi/ versus Pj /kə´rega, 'kita ja´vega/; and a full set of suffixed pronouns, often entailing shifted stress, e.g., /'kita/ 'did', /'kitum/ 'I did', /kɪ'tose/ 'we did'. Common lexical distinctions include Ser /vəɲɲaɳ/ 'to go', future /væsi/, versus Pj /jaɳa, ja´vega/, and the Ser objective and ablative postpositions /kũ, kənũ/ versus Pj /nũ, tõ/. Typical Seraiki shibboleths appear in /ə'khɪomɪs jo sakũ ɓəhũ jəldi vəɲɳa posi/ [*told-me-him that us- to very quick going fall-will*] 'I told him that we should have to go very early', where /ə'khɪomɪs/ has a double suffix (/'akhɪa/ + 1SG /-m/ + 3SG /-s/), versus the analytic Pj /mæ̃ o´nũ akhɪa pəi sanũ bɔ´t jəldi jaɳa pə´vega/.

Hindko

Hindko is the term locally used to cover the heterogeneous northern dialects spoken in the hilly areas above the Salt Range (Shackle, 1980). These include the well-described Awankari (Aw) (Bahri, 1963) and the very different Hindko of Peshawar city (Pe). Like

Lak

V A Friedman, University of Chicago, Chicago, IL, USA

Introduction

The Lak language (*Ethnologue* code LBE) belongs to the Daghestanian branch of the Nakh-Daghestanian family and has over 200 000 speakers, mostly in the Republic of Daghestan, Russian Federation (maps of the region are available through the website 'Thesaurus Indogermanischer Text- und Sprachmaterialien (TITUS)'; see Relevant Websites, at the end of this article). The Lak self-designation is *Lak* (adjective *Lak:u*); other terms include Turkish *Beyaz lezgi* 'White Lezgian' and *Kazikumux*, after Kumux, the main aul (village) of Lakkia and the former center of a feudal state. Lak glosses started around 1600; whole texts appeared in 1734. Lak was written in the Arabic Alphabet until 1928, then in Latin until 1938, and finally in Cyrillic. Lak has five dialects; the standard language is based on Kumux.

Phonology

The Lak vowels are /a, i, u/, all of which can be distinctively pharyngealized, which results in their allophonic centralization [æˤ, eˤ, øˤ]. The Lak consonants are shown in **Table 1**. Geminate (emphatic) consonants are realized as simple unaspirated, except in prevocalic (and, for stops, noninitial) position. Consonant labialization is distinctive in some dialects, and vowel length and stress interact.

Table 1 Lak consonants

b	p	p:	p'							w		m
d	t	t:	t'	c	c:	c'	z	s	s:	r	l	n
				č	č:	č'	ž	š	š:	j		
g	k	k:	k'					x̂	x̂:			
	q	q:	q'				ğ	x̌	x̌:			
								ħ				
	ʔ							h				

Morphology

Lak has four noun classes: I = male sentient, II = mature female sentient, III = other animate and some inanimate, and IV = inanimate and a few lower animals. Any part of speech can take class agreement markers, which are prefixed, infixed, and/or suffixed. Lak nouns have four stems, e.g., nominative (= absolutive) singular, as in *q:at:a* 'house'; oblique singular, as in *q:at-lu-*; nominative plural, as in *q:at-ri*; and oblique plural, as in *q:at-ra-*. There are more than 30 stem formants. Case endings attach agglutinatively to the oblique. The three core cases are nominative-Ø, genitive *-l*, and dative *-n*. Secondary cases include addressive/possessive *-x̂*, admotive/dative -2-*x̌:un*, ablative/involuntative/possibilitive *-š:a*, and comitative *-š:al*. A few other affixes attach to the oblique and/or nominative stems.

Lak has six oblique locational affixes (LA) to which five movement affixes (MA) can attach, forming potentially 30 local cases. Not all local cases occur in all combinations or with all substantives, but, unlike spatial postpositions (which take the genitive), local cases have nonlocational functions and cannot govern across a conjunction (abbreviations: IMP, imperative; SG, singular; NOM, nominative; GEN, genitive; EMPH, emphatic; OBL, oblique; PL, plural; INF, infinitive).

Morphology

Lak has four noun classes: I = male sentient, II = mature female sentient, III = other animate and some inanimate, and IV = inanimate and a few lower animals. Any part of speech can take class agreement markers, which are prefixed, infixed, and/or suffixed. Lak nouns have four stems, e.g., nominative (= absolutive) singular, as in *q:at:a* 'house'; oblique singular, as in *q:at-lu-*; nominative plural, as in *q:at-ri*; and oblique plural, as in *q:at-ra-*. There are more than 30 stem formants. Case endings attach agglutinatively to the oblique. The three core cases are nominative-Ø, genitive *-l*, and dative *-n*. Secondary cases include addressive/possessive *-x̂*, admotive/dative -2-*x̌:un*, ablative/involuntative/possibilitive *-š:a*, and comitative *-š:al*. A few other affixes attach to the oblique and/or nominative stems.

Lak has six oblique locational affixes (LA) to which five movement affixes (MA) can attach, forming potentially 30 local cases. Not all local cases occur in all combinations or with all substantives, but, unlike spatial postpositions (which take the genitive), local cases have nonlocational functions and cannot govern across a conjunction (abbreviations: IMP, imperative; SG, singular; NOM, nominative; GEN, genitive; EMPH, emphatic; OBL, oblique; PL, plural; INF, infinitive).

oˁwč-a wi-l-a dus-tura-j-n
invite-IMP you.SG-GEN-EMPH friend-OBL.PL-on.LA-to.MA
wa malla-na-j-n pulaw b-uk-an
and mullah-OBL-on.LA-to.MA pilaf(III) III-eat-INF
'Invite your friends and the mullah to eat pilaf'.

Lak has five sets of deictics, which also serve as third-person markers: *wa*, near the speaker, new information; *mu*, relevant to the addressee, old information; *ta*, opposite, level (older unmarked); *ga*, unmarked (older below speaker); and *k'a*, above speaker. The verb has three aspectual stems, perfective/unmarked (*buc-in* 'bring-INF'), durative in *-la-* (*buc-la-n*), and iterative in *-awa-* (*buc-awa-n*). Synthetic forms of the marked aspects occur only in the present and future. The infinitive serves as the base for the future. Past tense forms usually have a class marker infixed before the last root consonant, and an infixed negator (indicative *q:a-*, imperative *ma-*) precedes the infixed class marker. The verb has numerous synthetic and analytic paradigms marking aspect, tense, mood, and evidential, some with marking for person as well as class and number.

Syntax

Lak is basically object-verb, attributive/genitive-head; it has pragmatically conditioned free word order and a mixed ergative/accusative system. The converbs *ban* 'to do' and *x̂un* 'to become' are the most frequent markers of transitive/causative vs. intransitive, respectively. For the agent of an ordinary transitive verb, personal pronouns (first and second person) remain in the nominative; other agents take the genitive, which also functions as ergative. Case assignment and verb agreement also depend on the semantics of the verb, focus, and the pragmatic implications of the clause. Experiencers take dative; ability and accident are marked by ablative. Complement clauses trigger class III agreement. The following sentences are illustrative (a resumed morpheme interrupted by a class marker is indicated by <$>; GER, gerund; PRES, present; ABL, ablative; DAT, dative; ABS, absolutive; DUR, durative aspect; PA, perfective aspect).

Lakota

B Ingham, SOAS, London, UK

Introduction

Lakota is one of a group of closely related dialects sometimes referred to by linguists as Dakotan. These include Lakota in the west, Dakota in the east, Nakota in the north, and Nakoda in the northwest. The speakers of Lakota and Dakota were traditionally referred to in English as the Sioux, those of Nakota as the Assiniboine, and those of Nakoda as the Stoney. Lakota and Dakota are mutually intelligible. Reports differ as to how far Nakota and Nakoda are intelligible with the other two. Dakotan is part of a group of languages known as Siouan-Caddoan centered mainly on the central plains and prairies, but also represented on the eastern seaboard.

Reports on the number of speakers of Lakota range from 6000 to 20 000. Great efforts are being made to preserve the language in schools, colleges, and universities in the region and there is probably a considerable degree of partial or receptive knowledge of it.

Morphology

Major word classes of Lakota are noun, verb, adverb, postposition, demonstrative, pronoun, and conjunction. The verb in particular can be regarded as polysynthetic and noun incorporation occurs in the verb and adverb. The functions often covered by adjectives in other languages are covered in Lakota by stative verbs and adverbs.

The verb system is of the split intransitive type, where agents occur only in the Active verb class while patients occur with the Active and Stative types. These are marked in the verb by prefixes or infixes as shown below:

agent marker	patient marker
wa-'I'	ma-'me'
ya-'you'	ni-'you'
uŋ(k)-'we' ('you and I')	uŋ(k)-'us' ('you and me')
	wicʻa-'them' (animate)

composite pronoun prefix
cʻi-'I (agent)-you (patient)'

Plurality in the third and second person and inclusiveness of third persons in the first plural is marked by a suffix *-pi*. The occurrence of these markers with the two verb types is shown below:

Active verb *u* 'to come'

sing, exclusive		plur, inclusive	
wau	'I come'		
yau	'you (sing) come'	yaupi	'you (plur) come'
u	'he, she, it comes'	upi	'they (animate) come'
uŋku	'we (excl) come'	uŋkupi	'we (incl) come'

Stative verb *kʻuja* 'be ill'

sing, exclusive		plur, inclusive	
makʻuje	'I am ill'		
nikʻuje	'you (sing) are ill'	nikʻujapi	'you (plur) are ill'
kʻuje	'he is ill'	kʻujapi	'they are ill'
uŋkʻuje	'we (excl) are ill'	uŋkʻujapi	'we (incl) are ill'

Lakota

B Ingham, SOAS, London, UK

Introduction

Lakota is one of a group of closely related dialects sometimes referred to by linguists as Dakotan. These include Lakota in the west, Dakota in the east, Nakota in the north, and Nakoda in the northwest. The speakers of Lakota and Dakota were traditionally referred to in English as the Sioux, those of Nakota as the Assiniboine, and those of Nakoda as the Stoney. Lakota and Dakota are mutually intelligible. Reports differ as to how far Nakota and Nakoda are intelligible with the other two. Dakotan is part of a group of languages known as Siouan-Caddoan centered mainly on the central plains and prairies, but also represented on the eastern seaboard.

Reports on the number of speakers of Lakota range from 6000 to 20 000. Great efforts are being made to preserve the language in schools, colleges, and universities in the region and there is probably a considerable degree of partial or receptive knowledge of it.

Morphology

Major word classes of Lakota are noun, verb, adverb, postposition, demonstrative, pronoun, and conjunction. The verb in particular can be regarded as polysynthetic and noun incorporation occurs in the verb and adverb. The functions often covered by adjectives in other languages are covered in Lakota by stative verbs and adverbs.

The verb system is of the split intransitive type, where agents occur only in the Active verb class while patients occur with the Active and Stative types. These are marked in the verb by prefixes or infixes as shown below:

agent marker	patient marker
wa-'I'	ma-'me'
ya-'you'	ni-'you'
uŋ(k)-'we' ('you and I')	uŋ(k)-'us' ('you and me')
	wicʿa-'them' (animate)

composite pronoun prefix
cʿi-'I (agent)-you (patient)'

Plurality in the third and second person and inclusiveness of third persons in the first plural is marked by a suffix *-pi*. The occurrence of these markers with the two verb types is shown below:

Active verb *u* 'to come'

sing, exclusive		plur, inclusive	
wau	'I come'		
yau	'you (sing) come'	yaupi	'you (plur) come'
u	'he, she, it comes'	upi	'they (animate) come'
uŋku	'we (excl) come'	uŋkupi	'we (incl) come'

Stative verb *kʿuja* 'be ill'

sing, exclusive		plur, inclusive	
makʿuje	'I am ill'		
nikʿuje	'you (sing) are ill'	nikʿujapi	'you (plur) are ill'
kʿuje	'he is ill'	kʿujapi	'they are ill'
uŋkʿuje	'we (excl) are ill'	uŋkʿujapi	'we (incl) are ill'

Forms with both agent and patient prefixes, showing some infixed, are shown with the active verb *ole* ‘to seek’: *owicʽawale* ‘I seek them’, *owicʽayale* ‘you (sing) seek them’, *ocʽile* ‘I seek you (sing)’, *ocʽilepi* ‘I seek you (plur)’, *onile* ‘he seeks you (sing)’, *uŋkonilepi* ‘we (incl) seek you’, *omayale* ‘you (sing) seek me’, *uŋkoyalepi* ‘you (plur) seek us (incl)’.

Nouns do not show number distinctions, but may mark a possessor as in *mi-hiŋgna* ‘my husband’, *ni-hiŋgna* ‘your husband’, *mi-cʽiŋkṡi* ‘my son’, *cʽiŋkṡi-tku* ‘his, her son’. Other nominal prefixes may distinguish noun classes such as instruments as in *wi-cʽapʽe* ‘fork’, abstract concepts as in *wo-slolye* ‘knowledge’, time and space concepts as in *o-apʽe* ‘hour’, *o-makʽa* ‘year’, *o-napʽe* ‘refuge’.

Word Derivation

Word derivation is by affixation and compounding. Adverbs are formed with a suffix *-ya*, *-yela* or *-yaŋ* from stative verbs as in *waṡte* ‘be good’, *waṡte-ya* ‘well’, *ska* ‘be white’, *ska-yela* ‘whitely’, *wakʽaŋ* ‘be sacred’, *wakʽaŋ-yaŋ* ‘in a sacred manner’. Adverbs are widely used to state characteristics of objects often with the verb *haŋ/he* ‘stand’ as in *maḣpiya waŋ ska-yela he* ‘a cloud stood whitely’ meaning ‘there was a white cloud’, *op’osya he* ‘it stood coldly and clearly’ meaning ‘the weather was cold and clear’. Postpositions can be formed from adverbs by a prefix *i-* as in *wiyoḣpeyata* ‘in the west’, *i-wiyoḣ-peyata* ‘to the west of’.

A set of circumstantial stems are important in forming verbs, adverbs, wh-words and postpositions as in *tokʽeca* ‘be somehow’, *hecʽeca* ‘be like this’, *iyecʽeca* ‘be like’, *tokʽel* ‘how’, *hecʽel* ‘like this’, *iyecʽel* ‘like, as’ from a stem **-kʽecʽa/-kʽel* indicating ‘quality’. Other such stems are **-haŋ* ‘time’, **-kʽetu* ‘occurrence’, **-nakeca* ‘number’, **-haŋkeca* ‘(extent’, yielding among others *hehaŋ* ‘then’, *tohaŋ* ‘when’, *iyehaŋtu* ‘be time for’, *hecʽetu* ‘happen thus’, *iyecʽetu* ‘happen as’, *iyenakeca* ‘be as many as’, *iyena* ‘as many as’, *tonakeca* ‘how many’, *tohaŋyaŋ* ‘how far’, *iyehaŋyaŋ* ‘as far as’.

Syntax

Word order is generally agent-patient-verb as in *wicʽaṡa ki cʽiŋkṡitku ki ole* ‘the man looked for his son.’ Relative clauses are marked by the use of *waŋ* ‘one’, *ki* ‘the’ and *he* ‘that’ as in *wicʽaṡa waŋ cʽiŋkṡitku ki ole ki he owale* ‘I looked for the man who was looking for his son.’ Sentences can be embedded in higher sentences by using *ki/k’uŋ* ‘the’ and by certain postpositions as in *cʽiŋkṡitku ki ole ki slolwaye* ‘I know that he was looking for his son’, *cʽiŋkṡitku tʽi ekta wau* ‘I came to where his son lived’.

Nouns can be incorporated into verbs and verbs subordinated to other verbs by preposing, often also with stem truncation, as in *ṡuŋg-ole* ‘he looked for horses’, *ṡuŋg-manuŋ* ‘he stole horses’, *ṡuŋg-ole-mani* ‘he traveled looking for horses’ (*ṡuŋg-* ≪ *ṡuŋka* ‘horse, dog’), *iŋyaŋg-mani* ‘he traveled running’ (*iŋyaŋg-* ≪ *iŋyaŋka* ‘run’), *kaḣ-ṡi* ‘ask to make’ (*kaḣ-* ≪ *kaġa* ‘make’).

Men’s and Women’s Speech

These are distinguished by certain sentence-final particles of high frequency of occurrence shown below.

		male speaker	female speaker
declarative		-yelo, -welo, -kṡto	-ye, -we, -kṡto
interrogative		-hwo (*-he* informally)	-he
imperative	sing	-yo, -wo	-ye, -we
	plur	-po	-pe

Lancelot, Claude (1615–1695)

P Swiggers, Katholieke Universiteit Leuven, Leuven, Belgium

Born in Paris, Claude Lancelot entered the Saint Nicolas seminary in 1627, received tonsure in 1628, and became a member of the clergy without being ordained a priest. He studied theology, philosophy, and the classical languages, and also learned two modern Romance languages, viz., Spanish and Italian. Attracted by the doctrine of Saint-Cyran, he became one of the 'solitaires' at Port-Royal (near Paris), where a modern type of (individualized) education of young children was set up in the form of 'small schools' (*petites écoles*).

Lancelot (whose pseudonym was Sir de Trigny) was responsible for the grammatical instruction of the young pupils of these schools, mostly noble youngsters; he wrote manuals for their use, thus publishing a wide range of grammars, all inspired by the then widespread demand of 'methodical order and progression.' In 1644, he published a 'new method' for the teaching of Latin (the fifth edition, of 1656, incorporates important changes brought about by Lancelot's discovery of the works of F. Sanctius, G. J. Vossius, and G. Scioppius), in 1655 a 'new method' for the study of Greek, and in 1660 two 'methodical' manuals for Italian and Spanish. Also in 1660, the anonymous *Grammaire générale et raisonnée* [*de Port-Royal*], appeared; its authors were the theologian and logician A. Arnauld and Lancelot. The work, which offers a didactically oriented discussion on the nature and function of language (seen as a hierarchically-structured system of signs) and the content of grammatical categories (esp. word classes and their *accidentia*), stands at the beginning of the trend of 'general (or philosophical) grammars' in modern times.

Lancelot had a practical, modernist conception of grammar teaching; he preferred to start from the native language of the pupil, and laid stress on a clear typographical presentation, the use of synoptic tables, structural progression in teaching, and intelligent classroom use of high-quality literary texts.

In 1660, the Port-Royal schools were suppressed by royal order, and Lancelot first became a private preceptor, then a Cistercian monk (in the abbey of Saint-Cyran). He was ordained subdeacon in 1673, but left the abbey in order to become a Benedictine in Quimperlé, where he died on April 15, 1695.

Landau-Kleffner Syndrome

S Rémillard and H Cohen, Université du Québec à Montréal, Montréal, Canada
M Plaza, CNRS and Université Paris V René Desceartes, France

Landau-Kleffner syndrome (LKS), also called acquired epileptic aphasia, was first described by Landau and Kleffner in 1957. This syndrome is a rare childhood neurological disorder characterized by the sudden or gradual loss of receptive and expressive language skills and paroxysmal electroencephalographic (EEG) abnormalities. The EEG abnormalities are characterized by spikes, sharp waves, or spike–wave discharges usually recorded bilaterally and mainly over the temporoparietal (perisylvian) regions (Tuchman and Rapin, 2002). However, in 15% of cases, the epileptiform discharges are reported to be unilateral and

Landau-Kleffner Syndrome

S Rémillard and H Cohen, Université du Québec à Montréal, Montréal, Canada
M Plaza, CNRS and Université Paris V René Desceartes, France

Landau-Kleffner syndrome (LKS), also called acquired epileptic aphasia, was first described by Landau and Kleffner in 1957. This syndrome is a rare childhood neurological disorder characterized by the sudden or gradual loss of receptive and expressive language skills and paroxysmal electroencephalographic (EEG) abnormalities. The EEG abnormalities are characterized by spikes, sharp waves, or spike–wave discharges usually recorded bilaterally and mainly over the temporoparietal (perisylvian) regions (Tuchman and Rapin, 2002). However, in 15% of cases, the epileptiform discharges are reported to be unilateral and

show temporal lobe predominance. The major characteristic of LKS is the presence of continuous spike-and-waves EEG discharges during 85% of the slow sleep period (Hirsh *et al.*, 1990). All six children with LKS in the Lewine *et al.* (1997) study showed continuous spike-and-waves during slow sleep (CSWS). Onset of aphasia in LKS typically occurs between 3 and 9 years of age. There is sex predominance with a male:-female ratio of approximately 2:1. Although language regression is the key feature of clinically typical LKS, cognitive and behavioral dysfunctions such as motor hyperactivity, decreased attention, aggressiveness, and social withdrawal can also accompany this disorder (Pearl *et al.*, 2001).

Clinical epileptic seizures are seen in many of the affected children either before or after the onset of aphasia (Beaumanoir, 1992). Although 70–80% of patients show seizures (Hirsch *et al.*, 1990), epilepsy is not an essential criterion for the diagnosis of LKS, in contrast to the EEG abnormalities that are present in all LKS cases (Beaumanoir, 1992; Sobel *et al.*, 2000). The usual types of epilepsy observed in LKS may be simple partial motor, generalized tonic–clonic, or atypical absence seizures (Beaumanoir, 1992; Metz-Lutz *et al.*, 1999; Morrell *et al.*, 1995). Myoclonic and tonic seizures are uncommon (Deonna, 1991). In general, the seizures are easily controlled with anticonvulsive medication and, like the EEG abnormalities, remit by the end of adolescence (Beaumanoir, 1992; Hirsch *et al.*, 1990). The etiology of LKS remains unknown and may be due to diverse causes. Some cases of LKS have been associated with toxoplasmosis (Michalowicz *et al.*, 1989), inflammatory demyelinating illness (Perniola *et al.*, 1993), temporal lobe tumor (Nass *et al.*, 1993; Solomon *et al.*, 1993), and neurocysticercosis (Otero *et al.*, 1989).

There is no evidence of anatomical brain lesions. Furthermore, the results of computed tomographic scan (Guerreiro *et al.*, 1996; Hirsch *et al.*, 1990) and magnetic resonance imaging (Hirsch *et al.*, 1990) appear normal. However, single-photon-emission computed tomography and positron-emission tomography (PET) studies have shown unilateral left temporoparietal or bitemporal abnormalities as manifested by increased glucose utilization (Guerreiro *et al.*, 1996; Rintahaka *et al.*, 1995).

Linguistic Aspects

The first manifestation of the language disturbance in LKS is an apparent 'word deafness' or verbal auditory agnosia, occurring in a child with previously normal language development. In many cases, this auditory agnosia extends to familiar sounds including bells, whistles, or a ringing phone (Pearl *et al.*, 2001). Generally, it is the first symptom preceding the epileptic manifestations and expressive language dysfunction. At first, these children may appear to be deaf. However, hearing tests, such as brainstem auditory evoked responses and conventional audiologic assessment, usually reveal normal conduction of acoustic stimuli from peripheral level to the primary auditory cerebral cortex (Pearl *et al.*, 2001). Thus, some authors consider this auditory recognition impairment as a specific deficit in higher phonological decoding processes (e.g., Korkman *et al.*, 1998), and others focus on the dissociation between auditory and phonological processing (Plaza *et al.*, 2001).

The second manifestation of language dysfunction is characterized by an impaired expressive communication. There is a progressive decline in the vocabulary of the affected child accompanied by difficulties in articulation and telegraphic speech disturbances (Metz-Lutz *et al.*, 1999). The expressive language dysfunction gradually increases and leads to frank mutism (Beaumanoir, 1992; Metz-Lutz *et al.*, 1999; Morrell *et al.*, 1995; Pearl *et al.*, 2001). Paraphasias and neologisms are often observed before the complete loss of expressive language (Metz-Lutz *et al.*, 1999). Agrammatism, echolalia, anomia, and phonetic distortion have also been reported in some cases of LKS (Paquier *et al.*, 1992).

Language disturbance may fluctuate significantly during the course of LKS, with remissions and exacerbations (Lanzi *et al.*, 1994; Pearl *et al.*, 2001), but total recovery is uncommon (Santos *et al.*, 2002). Although spontaneous recovery has been reported (Santos *et al.*, 2002; Deonna *et al.*, 1989), the majority of children with LKS are left with significant language deficits (e.g., severe dyslexia, severe to moderate expressive aphasia, or global aphasia; Bishop, 1985; Deonna *et al.*, 1989). Morrell *et al.* (1995) have proposed that excessive epileptic discharge during the childhood period of language development, in children with LKS, results in functionally inappropriate synaptogenesis and then deficient synaptic pruning in the same regions subserving language function. Thus, nonfunctional synaptic contacts remain in the language cortex even after the epileptic process has disappeared, leaving residual language deficits. Older children, who have learned to read and write, may lose these abilities in the course of the disease. However, a partial retention of writing skills may suggest a better prognosis in the re-education phase (Beaumanoir, 1992).

Originally, Landau and Kleffner (1957) reported a correlation between the degree of language dysfunction and the severity of the EEG abnormalities. However, the relationship between EEG and aphasia in LKS is not clear and still controversial. Some authors

have shown considerable speech recovery in patients with the disappearance of EEG abnormalities when successfully treated with anticonvulsant medication (Lanzi *et al.*, 1994; Morrell *et al.*, 1995; Sobel *et al.*, 2000). Others have shown no association between linguistic abilities and EEG abnormalities. Improvement or worsening of aphasia occurs independently of the EEG abnormalities (Deonna, 1991). In contrast to the hypothesis initially proposed by Landau and Kleffner, Holmes and Riviello (2001) suggested that the epileptic discharges are the epiphenomena of the underlying pathology of cerebral speech areas, rather than the cause of the aphasia. Metz-Lutz *et al.* (1999) associated the persisting verbal impairments in LKS patients with a phonological short-term memory deficit. A PET study has shown less activation in the right and left superior temporal gyri of adults who recovered from LKS during a task of serial words recall (Majerus *et al.*, 2003).

Treatment and Prognosis

As most authors have emphasized, the seizure disorder and the EEG abnormalities tend to remit by the age of 12 or 13, whereas language dysfunction persists into adulthood to variable degrees (Deonna, 1991; Metz-Lutz *et al.*, 1999; Morrell *et al.*, 1995). However, case studies report variable prognosis concerning the evolution of language dysfunction in LKS children. Few children recover completely from their aphasia (Santos *et al.*, 2002), whereas others show complete absence of speech (Deonna, 1991). Nevertheless, the majority of LKS patients show partial recovery of linguistic abilities. A late outcome study investigating late auditory evoked potentials over the temporal areas previously involved by epileptic discharges has revealed a permanent dysfunction in the associative auditory cortex, characterized by a unilateral extinction on dichotic listening tests (Wioland *et al.*, 2001). To compensate for language deprivation during the active period of LKS, rehabilitation strategies, such as sign language or cued speech, are particularly encouraged (Gordon, 2004; Metz-Lutz *et al.*, 1999). These compensatory strategies provide an alternative means of communication that may facilitate recovery of speech and language.

According to Bishop (1985), an important factor negatively influencing language prognosis is the early age of onset (i.e., before the age of 5 years). Another critical factor influencing prognosis is the duration of the EEG abnormalities and the period of CSWS. As suggested by Morell *et al.* (1995), the long-term effect of the epileptiform discharges on brain cells of a cortical area results in the disruption of normal axonal pruning. Grote *et al.*'s (1999) study, in which the patients with the shortest duration of illness were most improved, provides good support for this hypothesis.

One question is how reading and spelling could be acquired by children with LKS. A recent case study of a girl (subject M.M.) followed for five years and after recovery (Plaza, 2004), focused on written language, which M.M. acquired in spite of persistent but heterogeneous phonological impairment (efficient retrieval of phonological information from long-term memory, restriction of working memory and slow processing in phonological awareness tasks). M.M. developed above-average reading and spelling skills, notably for real words, and gradually mastered pseudoword reading. However, she remained impaired in pseudoword spelling. The fact that M.M.'s performance on pseudoword tasks was poor when the stimuli were presented auditorily, and more efficient when they were presented visually, suggested that the observed phonological impairment was (1) due to a deficit at the level of cortical auditory processing, and (2) related to the temporal lobe dysfunction observed through the long-lasting right channel extinction in dichotic listening tasks.

The treatment of LKS aims at eliminating or reducing the epileptiform activity early in the course of the disease and includes anticonvulsants (Marescaux *et al.*, 1990), immunoglobulin (Mikati and Saab, 2000), and corticosteroid (Tsuru *et al.*, 2000) therapies. However, the outcome on language following pharmacological treatment remains variable and unpredictable. In the case of intractable epilepsy, multiple subpial transection surgery, a more radical and controversial therapeutic method, has met with successful results (Grote *et al.*, 1999; Morell *et al.*, 1995).

In summary, LKS provides an important model of the way in which epilepsy can affect language and cognition. This language disorder reinforces the hypothesis that focal epileptic activity occurring during a critical period of brain maturation may result in a permanent cerebral dysfunction which nevertheless can be compensated for by cognitive strategies.

Langacker, Ronald W. (b. 1942)

J-M Fortis, CNRS, University of Paris, Paris, France

Ronald W. Langacker was born on December 27, 1942 in Fond du Lac (Wisconsin, USA). He graduated from the University of Illinois in 1966 before moving to the University of California at San Diego, where he now occupies a chair of linguistics. At the beginning of his career he did fieldwork, notably on Luiseño and Papago (O'odham) (two Uto-Aztecan languages). The outcome was a four-volume survey on Uto-Aztecan languages for which Langacker himself wrote a general introduction and assumed editorial control. His contribution to Uto-Aztecan linguistics also includes a monograph bearing on reciprocal/reflexive predicates and their relation to passives and impersonals.

In the mid-1970s, Langacker laid the foundations of a theoretical framework called 'space grammar.' This designation was apparently motivated by the idea that linguistic facts, like vision, involve a perspective on situations from a vantage point centered on ego. This theory was notably applied to the analysis of English epistemic modals, whose order was correlated with a layered structure of conceptualizations.

The theory was renamed 'cognitive grammar' in the 1980s (for an introduction, see Langacker, 1982 and 1986). It is cognitive in several respects: (1) grammatical notions are given definitions that appeal to properties of perceptual representations, e.g., the grammatical subject and object are defined in terms of figure/ground organization of conceptualized situations; (2) linguistic structures are formed and categorized by cognitive processes that are shared by other cognitive systems. Thus, the ability to form phrase schemas rests on the capacity for abstracting commonalities from inputs instantiating any more abstract structure; since this is a psychological process, schemas of various degrees of generality may proliferate (cognitive grammar seeks no economical representation of linguistic structures); (3) linguistic representations are structured like other representations; for instance, membership in a category is not an all-or-nothing affair but a matter of degrees (typicality effects); (4) some linguistic phenomena reflect the operation of 'imagery,' i.e., the ability to form alternate construals of the same situation. Thus, ergative and accusative systems are claimed to reflect 'conceptual paths' originating from, respectively, the undergoer of a process and the initiator of an action; (5) the conceptualization of reality is based on cognitive models of the world, in particular, a naive physical theory of causal interactions.

Cognitive grammar has become a major theoretical trend within cognitive linguistics. Further, after the creation of the journal *Cognitive Linguistics* and of the International Cognitive Linguistics Association (in 1989), cognitive grammar has gained an international influence.

Language Acquisition Research Methods

E Kidd, University of Manchester, Manchester, UK

As a subdiscipline of psycholinguistics the broad aim of language acquisition research is to understand the architecture and development of the language faculty. In fulfilling this aim, child language researchers are faced with a problem pervasive in all disciplines of science: data collection relies on observation, which is indirect and theory dependent. To overcome this problem researchers use a vast array of research methodologies that provide convergent evidence for or against a current position or theory. This article surveys the types of methods that are used in the field.

Naturalistic Speech Data

Researchers have collected naturalistic speech data from children as far back as Darwin (1877). This was done initially using diary studies, whereby researchers recorded the child's speech in a logbook. The focus was on phonological, lexical, or syntactic development. The collection of naturalistic speech data was revolutionized by the technological advances that enabled children's speech to be recorded. This was particularly the case for researchers studying phonological development, where recording enabled more accurate categorization of speech patterns. Brown's (1973) longitudinal study of three English-speaking children set the standard for the discipline. The construction of an electronic archive of children's transcribed naturalistic speech, the Child Language Data Exchange System (CHILDES; see MacWhinney, 2000), has enabled researchers from all over the world to share and use data to answer a multitude of research questions.

Naturalistic speech data has numerous advantages. In particular, longitudinal data can be useful for identifying general developmental trends. This is particularly useful for languages that have not been studied extensively (Demuth, 1996). The disadvantage of naturalistic speech data is that such data can underestimate children's knowledge, since children do not always say what they know. Furthermore, low-frequency linguistic patterns are unlikely to be recorded, since practical limitations in data collection mean that naturalistic studies record only a small percentage of children's total speech (Tomasello and Stahl, 2004). It is for these reasons that experimental data are useful for determining children's linguistic knowledge.

Experimental Approaches

Experimental approaches to the study of child language probe either children's production or comprehension. The choice to study production or comprehension depends on one's research question, as does the particular method used. Since children are generally assumed to understand more than they say (Shipley *et al.*, 1969), comprehension tasks enable researchers to test the limits of children's linguistic knowledge. On the other hand, children's productive use of language in experimental settings can potentially enable researchers to make strong claims about the abstractness of knowledge, for instance, knowledge of syntactic and phrasal categories, or discourse competence, such as when children correctly use various linguistic devices to introduce and resume reference to entities in discourse.

Production Tasks

There are numerous ways to elicit language from children in experimental settings. Since children are not aware of the linguistic target of interest, such studies must be carefully designed to restrict the range of linguistic options that children can produce. For instance, Berko's (1958) 'Wug' test investigated children's morphosyntactic knowledge by creating an appropriate sentential context. Variants of this task, which make use of novel words, are still being used in present-day research. Other researchers have been successful in eliciting various syntactic forms from children (Crain and Thornton, 1998). Such studies show that target forms can be elicited when the correct aspects of the environment are manipulated and when children are probed with questions that constrain potential answers. Syntactic priming, where children are primed with a target structure prior to being required to produce language, is another method that increases the chance that a particular structure will be produced. Another production method that is useful for investigating children's syntactic knowledge is elicited imitation. In this method, children repeat sentences spoken to them by an experimenter. Exact repetitions suggest that children are competent with the structure under investigation. Children's spontaneous changes to the test structure can provide some insights into the child's analysis and interpretation of the adult model.

A less constrained method of eliciting language from children is to collect narrative data. One particularly useful method has been to ask children to describe picture books in which a protagonist engages in an activity attractive to children. One book on which there is a substantial amount of data is Mayer's (1969) *Frog, Where Are You?* (see Berman and Slobin, 1994). Narrative data provide useful insights into children's knowledge of discourse devices, such as referent introduction and anaphora, and into the discourse bases of grammatical constructions that encode both new and old information, such as many types of complex sentences. Referential communication tasks (see Lloyd *et al.*, 1998) enable one to investigate children's communicative competence and, in particular, their understanding of conversational implicatures. This method therefore indicates children's understanding of a conversational partner's discourse knowledge.

Comprehension Tasks

Comprehension tasks provide the experimenter with a greater degree of control over the outcome of an experiment than do production tasks. This is largely because children's linguistic knowledge is inferred

from certain behaviors; for instance, their preference for one interpretation or referent over another, or their 'yes/no' judgment of the grammatical acceptability of a sentence. Since children's knowledge is inferred from their behavior, researchers must be careful to design studies with exclusionary criteria that identify children who are using non-linguistic strategies in the task, such as always providing affirmative judgments of sentences on every trial of an experiment investigating children's grammaticality judgments.

Tasks that require children to select a referent or interpretation from a set are useful because they can be used to test children's knowledge at either the lexical or the sentential level. Either pictures or real objects can be used in word learning experiments; experiments conducted at the sentential level, where a number of interpretations are provided, generally use pictures. The preferential looking and preferential listening paradigms provide alternative dependent measures; they use the continuous variables of looking or listening time to infer children's knowledge (Fernald, 1985; Golinkoff *et al.*, 1987; Jusczyk, 1997). These tasks are useful because they can be used with very young infants, since tasks demands are greatly reduced. Preferential listening (or 'head preference') is most often used to investigate children's speech perception. This technique can, for instance, probe children's sensitivity to the phonotactic regularities and phonemic contrasts of their input language. It can also be used to investigate young children's sensitivity to prosody. One disadvantage of preferential looking and listening is that they yield rather noisy individual data and therefore require one to test enough participants to ensure that stable behavioral patterns are observed.

One popular comprehension method is the act-out task, where children are provided with toy figurines that act as referents for participants in test sentences. The act-out methodology is flexible enough to be used for variety of syntactic phenomena. One disadvantage is that the task imposes considerable demands on children, who must process the test sentence and translate their interpretations onto the toy referents provided (Hamburger and Crain, 1987). This problem can be partially alleviated by providing discourse contexts to test sentences. Another set of methods that probe children's comprehension are judgment tasks. These require children to provide yes/no judgments about the acceptability of linguistic stimuli. When used with very young children, these tasks usually involve a puppet who, the child is informed, "hasn't learned to talk properly" (Lloyd and Donaldson, 1976). The child is then required to judge whether the puppet has used the correct language in a given situation. Metalinguistic tasks, such as grammaticality judgments, which are generally conducted with older children (Bialystok, 1986; Wufleck, 1993), simply require a yes/no response. These tasks enable the researcher to determine which aspects of language children find acceptable, and are particularly useful for probing syntactic knowledge.

One final set of comprehension tasks are those that yield 'on-line' reaction time data. There are many on-line techniques, but the best are those that do not require children to read. Some techniques traditionally used to test adults have been developed for use with children, such as mispronunciation detection, cross-modal priming, word monitoring (see McKee, 1996), and self-paced listening (Booth *et al.*, 2000). These 'button-pressing' techniques require children to make decisions about different aspects of language (e.g., lexical decisions, judgments, and comprehension questions). Finally, the eye-tracking technique records children's eye movements to toys or pictures as they hear a test sentence (Trueswell *et al.*, 1999). One clear advantage of on-line tasks is that they explicitly test children's parsing systems, which can in turn suggest the aspects of language that children are most sensitive to as they hear it.

Comparative Methods

Comparative studies in child language research take one of two forms: comparative studies of methods and cross-linguistic comparisons. The former are generally conducted within a given language and provide convergent evidence for the psychological reality of an observed experimental phenomenon (e.g., a comparison of naturalistic and experimental data). The latter have been used extensively in acquisition research to identify universal features of the acquisition process. This approach has been taken by Slobin *et al.* (1985, 1992, 1997). Extensive cross-linguistic data have also been collected on children's comprehension strategies (MacWhinney and Bates, 1989) and children's narrative (Berman and Slobin, 1994). Furthermore, ethnographic research investigates how socialization influences acquisition, recognizing that the child learns language in a rich social context (Ochs and Schieffelin, 1995).

Computational Approaches

Data collected from human participants enable researchers to hypothesize acquisition mechanisms and suggest potential architectural aspects of the language faculty. However, as noted previously, these phenomena are not directly observable. Computational approaches to language acquisition enable

researchers to build hypothesized architectures that are augmented by learning mechanisms and compare the output of these models to data from human participants. Since the manner in which computational models learn language is more transparent than that of the child, computational research provides valuable insights into the acquisition process. There are many different families of computational architectures. One popular computational approach in child language research has been connectionism (Rumelhardt and McClelland, 1986; Elman *et al*., 1996), but other symbolic approaches have made equally significant contributions (Brent, 1997).

Standardized Language Tests

Standardized language tests provide population norming data from which individual children's linguistic knowledge can be estimated relative to their age. This information is useful for a number of reasons. First, many comprehensive tests can be used to diagnose language impairment. Second, standardized language tests can be used to estimate the language level of special populations so that individuals can be matched with normally developing children of the same language ability for purposes of comparison.

Which Method Is Best?

Every method has its advantages and disadvantages. In general, a researcher's choice of method depends on the research question and the age range of the children who will participate in the study. For instance, most on-line methods are unsuitable for children under the age of 3 years, who generally do not understand the requirements of the task. Conversely, preference techniques such as preferential looking and listening are generally suitable only for infants, as older children will quickly become bored with the task. Certain methods are more suitable than others for certain linguistic phenomena. For instance, if studied experimentally, children's syntactic knowledge is best investigated using techniques such as act-out, elicited imitation, or elicited production, where it is possible to manipulate the language children hear or the contexts that lead to the use of different grammatical structures. The acquisition of concrete lexical categories such as nouns is best investigated using preference methods such as picture or referent selection and preferential looking.

The choice of the method will affect the choice of statistics one uses to analyze the data. Cross-sectional designs, which test a number of different age groups, will generally require parametric or nonparametric statistics, depending on the dependent measure. It is possible to analyze longitudinal naturalistic speech data using advanced statistical techniques such as regression or time-series modeling, provided one has enough data points and the assumptions of the statistical technique are not violated. However, sometimes a research question can be answered using simple statistical conventions, such as reporting mean values for variables of interest.

Conclusion

There are numerous methods available for investigating child language acquisition. Choosing a particular method will depend on a number of factors, including the research question, the age of the children to be tested, and other practical considerations, such as expense. The range of methods available enables researchers to approach problems from a number of angles, which can serve to strengthen theoretical claims if convergent evidence is yielded using different methodologies.

Language Adaptation and Modernization

S Bowerman

This article is reproduced from the Concise Encyclopedia of sociolinguistics pp. 626–630, © 1994, Elsevier Ltd.

Introduction

'Language adaptation' refers to linguistic change, whether deliberate or spontaneous, whose goal is to adapt a language to the changed or changing needs of its speech community. The term is nearly synonymous with 'language modernization,' as the needs of a speech community are often a function of the times. Coulmas (1989: 1) argued that the term 'modernization' is less suitable, as it is often taken to refer to the present day. Language adaptation is a relatively new term in sociolinguistics, but the phenomenon affects all languages at all times.

The field of language adaptation and modernization largely intersects with that of language planning (*see* **Language Planning and Policy: Models**) in that a language is sometimes deliberately adapted to fulfill new roles. Natural language adaptation is spontaneous and is unconsciously undertaken by its own speech community. Intervention is necessary only when a language, previously excluded for some reason from certain domains of use, suddenly needs to be used for those functions. It is therefore desirable to distinguish between linguistic change that comes about naturally and that which is forced.

Factors Influencing (Deliberate) Language Adaptation

Dominance and Domain Exclusion

Many of the world's language communities are dominated in some way by another language community that is politically, economically, or numerically more powerful (cf. Tollefson, 1991: 14). The dominant community's language becomes the medium for the higher domains of language use (*see* **Pragmatics: Linguistic Imperialism**; **Power and Pragmatics**), such as government, media, education, technology, and commerce, to the exclusion of the dominated language.

Language Adaptation and Modernization

S Bowerman

This article is reproduced from the Concise Encyclopedia of sociolinguistics pp. 626–630, © 1994, Elsevier Ltd.

Introduction

'Language adaptation' refers to linguistic change, whether deliberate or spontaneous, whose goal is to adapt a language to the changed or changing needs of its speech community. The term is nearly synonymous with 'language modernization,' as the needs of a speech community are often a function of the times. Coulmas (1989: 1) argued that the term 'modernization' is less suitable, as it is often taken to refer to the present day. Language adaptation is a relatively new term in sociolinguistics, but the phenomenon affects all languages at all times.

The field of language adaptation and modernization largely intersects with that of language planning (*see* **Language Planning and Policy: Models**) in that a language is sometimes deliberately adapted to fulfill new roles. Natural language adaptation is spontaneous and is unconsciously undertaken by its own speech community. Intervention is necessary only when a language, previously excluded for some reason from certain domains of use, suddenly needs to be used for those functions. It is therefore desirable to distinguish between linguistic change that comes about naturally and that which is forced.

Factors Influencing (Deliberate) Language Adaptation

Dominance and Domain Exclusion

Many of the world's language communities are dominated in some way by another language community that is politically, economically, or numerically more powerful (cf. Tollefson, 1991: 14). The dominant community's language becomes the medium for the higher domains of language use (*see* **Pragmatics: Linguistic Imperialism**; **Power and Pragmatics**), such as government, media, education, technology, and commerce, to the exclusion of the dominated language.

Because the dominated languages are excluded from these higher domains, their lexicons, for example, do not keep up with the development of the dominant language as new terms are coined to describe new phenomena and experiences. The need for language adaptation is often recognized when there is a change, or a push for change, in the social structures that keep the dominance relationship between language communities intact. When this happens, and the (previously) dominated language is required as a medium for the higher domains, it is often found to be inadequate in terms of technology, modes of expression, etc.

Domain exclusion also impacts upon a language's speech community on a social level. A language that is excluded from the higher domains of language use is reserved for the lower or more basic domains, i.e., the home and community environment. This means that they will not be perceived as tools for economic advancement and will consequently suffer from low status and prestige (*see* **Language Planning and Policy: Models**; **Pragmatics: Linguistic Imperialism**). The language becomes stigmatized, even in its own community, and members of the language community who seek economic advancement will seek to acquire the dominant language. If the status of a language in such a position is not improved, it may well face obsolescence.

The postcolonial experience of many African and Asian nations in the mid-to-late 20th century was a proving ground for the dominated indigenous languages. The colonial languages had almost invariably been used as media for the higher domains, to the exclusion of the indigenous languages (Phillipson, 1993: 112, Chap. 5). The demise of colonialism meant that many countries were faced with a dilemma: whether to retain the colonial language as a high-domain medium or replace it with one or more indigenous languages. Retaining the colonial language carried unpleasant connotations, but it was already developed enough to cope as the medium of a modern industrial state and was entrenched in that role (Schmied, 1991: 19). The indigenous languages, on the other hand, had been excluded from the higher domains and had neither the status nor the corpus (*see* **Language Planning and Policy: Models**) to cope with their new roles. Although the indigenous languages were often instituted as symbolic official languages, the colonial languages was retained for higher domain use in most cases (Schmied, 1991: 20). Although the dominance of colonial languages, particularly those that offer global access, is all but assured (Laitin, 1992: 181), there is a concerted effort for the functional expansion of indigenous languages.

The Transition from Oracy to Literacy

The move from oracy (*see* **Oracy Education**) to literacy (*see* **Literacy Practices in Sociocultural Perspective**) also creates a need for language adaptation. Indeed, the need for a written language where there was none before reflects a drastic change in the social structure of a community. There are (at least) two ways of fulfilling this need: the adoption of an already written language for these purposes or the adaptation of the oral language to writing. Most societies have had to face this transition at some point in their history, whether this developed naturally or was thrust upon them from outside. Thus, the written language may differ completely from that which is spoken – which, as Coulmas (1989: 13) pointed out, is to be expected as speech and writing serve different communicative functions. Moreover, writing in the initial stages of the transition from oracy to literacy is usually the domain of an elite few. However, the adaptation of an oral language to writing reflects a change in the communicative function of that language, which in modern times has spread to the rest of the society. Whereas the 'undiscovered' world coped for millennia without writing, illiteracy in present times is viewed as a scourge.

Coulmas (1989: 12) noted that literacy does not necessarily stimulate language adaptation *per se*, but serves as a tool for carrying out the process. A written language can easily be codified into a set of rules to be transmitted through education. This in turn affects the acquisition and use (particularly in the higher domains) of a language.

Attitudes and Language Maintenance

As with any language planning measure, it is the attitude of the people for whom language adaptation is to be undertaken that will determine whether or not it is successful. One crucial factor in forming a community's attitude is the degree to which the language will be useful, i.e., the domains to which a particular language gives access (Phillipson, 1993: 79, 80; Cooper, 1989: 100, Chap. 5). Loyalty to a language and culture is another factor affecting the maintenance of a language. Although the revival of Irish Gaelic (Irish) in Ireland has turned out to be little more than symbolic, it is the loyalty of the Irish to their language that led to its extensive adaptation, even though English serves all the language needs of the majority. Languages that are neutral, i.e., do not carry ethnic connotations, are more likely than others to be used as languages of wider communication. The neutrality of Swahili in East Africa led to its being extensively adopted as a national language in Kenya and an official language in Tanzania, and therefore

to the extensive expansion of its functional range (Cooper, 1989: 102).

The Process of Language Adaptation

Two Aspects of Adaptation

The process of equipping a language to deal with the realities of its speech community involves two aspects: one external to the language (involving the speech community) and one internal to the language (involving the structure of the language itself). In order for a language to be successfully adapted, that language must be widely used by its speech community in the domains concerned. This requires not only the elaboration of its lexicon, but also the boosting of its status. Adaptation and modernization through language planning are at an early stage; it is the implementation of language planning measures by a speech community that tells us whether the language has been successfully adapted or not.

Adaptation through Status Planning

A common way of boosting the status of a langauge, and facilitating its adaptation and modernization, is through functional reallocation. Thus, a language previously excluded from the higher domains is allocated to those domains (Cooper, 1989: 99, 118). These measures take time to be implemented: before a language can be properly used in a domain from which it was previously excluded, it must be developed as a medium for that domain.

After their independence from colonial rule in 1962 and 1963, respectively, Tanzania and Kenya wished to establish a national African language in place of the colonial one (Laitin, 1992: 91). Swahili was the natural choice, having few 'tribalist' associations and a long history with the liberation movements (Laitin, 1992: 91–92). In Tanzania (then called Tanganyika), Swahili was proclaimed as the language of state and public functions; shortly thereafter it became the 'major language of Parliament' and was introduced as the 'medium of instruction in all public primary schools' (Massamba, 1989: 63). Although Swahili still faces serious competition from English, its adaptation and modernization have been widely accepted.

Corpus Adaptation and Modernization

Terminology Development In order to fulfill its role as a high-domain medium, a language's corpus (lexicon and grammar) must be sufficiently developed. In cases where a language has been excluded from a domain it now wishes to occupy, its terminology and perhaps modes of expression need to be adapted to its new roles. There are various ways of adapting terminology, taking the target language system into account. It can be achieved through neologism, calquing, transliteration, and meaning extension (Alberts, 1998: 233). Alberts (1998) provided some examples of these four methods of terminology development from South African languages, adapted here in Table 1.

As can be seen from some of the examples in Table 1, terminology development must take the target language into account and we see how calquing and borrowing adapt from the sound system of one language to the other. Grammar is also an important device in language adaptation and, particularly, terminology development. Table 2 shows how new coinages in Irish were applied to existing grammatical structures. O'Baoill (1988: 116) gave the example of the creation of an Irish term for 'lithograph' and some of its derivatives. The new lexeme is a Hibernized borrowing from English, to which productive derivational morphemes are applied.

Languages also reflect their adaptation to a new or changed social order by getting rid of certain elements that tie them to the past. The reform of Turkish under Attatürk in the 1920s saw all Western Farsi (Persian) and Standard Arabic (Arabic) loan words expelled from the standard Turkish lexicon (Cooper,

Table 1 Terminology development in South African languages

Method	*Example*
Calquing: direct translation, especially of compounds	English *cellphone* > Afrikaans *selfoon*
Loan words: borrowing a word, or the sound of a word, by another language	English *cellphone* > Sotho *selula founo*, Zulu *iselula*
	English *computer* > Xhosa *ikompivuta*, Zulu *ikhomputha*
Transliteration: use of the classic stem to coin an equivalent	English *silver* > Xhosa *isilivere*, Zulu *isiliva*
Extension of meaning: use of existing words, but broadening the meaning to include more modern concepts	Zulu *bafana bafana* (reduplication) = 'the boys'; extension of meaning to the soccer team, i.e., young male competitors on the international soccer scene
Neologism: new words created from within the target language	English *unleaded petrol*, Afrikaans *ongelode petrol* (Creation of the verb *lood* 'lead,' past participle *gelode* 'leaded' from Afrikaans noun *lood* 'lead')

Table 2 An example of terminology development in Irish

English term	*English derivational morphemes*	*Standardized Irish borrowing*	*Irish derivational morphemes*
lithograph		*liteagraf*	
	-er		*-ái*
	-y		*-áiocht*

1989: 154, citing Heyd, 1954). Similarly, some sectors of the French government have tried to block the number of loan words entering into French usage (Appel and Muysken, 1993: 164).

Grammatical Development The development of a grammar to suit modern or high-domain purposes often results in a simplification of grammatical forms that are considered unwieldy, anachronistic, and unsuited to scientific and commercial discourse. Grammatical development may mean bringing the grammar of a language more into line with that of a dominant language. For example, there have been some attempts to bring the grammar of Irish more into line with that of English (Greene, 1972: 15). Developing a standard grammar for Hebrew (Modern Hebrew) from Biblical Hebrew processes, as well as innovation, in Israel spurred the creation of a multitude of new word forms. Grammar can especially be a problem in situations where there are a number of varieties of a language. In order for the language to be adapted to modern roles, it requires codification and therefore standardization (*see* **Standardization** (03048)). Thus, where more than one form is found across varieties, one must be chosen as the standard. This applies to all aspects of the corpus.

Orthography and Spelling Orthography and Spelling are two more aspects of the corpus, which are taken into account when conscious adaptation and modernization take place. Orthography refers to the script that is used to represent the spoken language, and spelling refers (roughly) to the way it is used.

When a language is selected for adaptation and modernization, an orthography needs to be selected for it. If the language has never been written before, an orthography must be created – a process known as graphization. If, however, an orthography already exists, a decision must be made as to whether this system should be retained or a new system found. This process is known as regraphization (Cooper, 1989: 125, 154). Christian missionaries graphized most of the oral languages of southern Africa in the 19th and 20th centuries. Generally, a Roman script was imposed and the spelling system of the missionaries' nationalities informed the orthography and spelling. Whereas graphization is one aspect of language adaptation, regraphization is also important. The change in orthography reflects a change in society. An early example of this was the development of the Cyrillic alphabet, so that biblical and ecclesiastical texts could be translated into Slavic languages. More recently, Turkish adopted a Roman script in place of the Persian orthography it had used before (Haugen, 1972: 170, citing Heyd, 1954). Orthography can have powerful symbolic value for a speech community. In the 1930s, the Soviet government imposed the Cyrillic script on non-Russian languages within the USSR (Mesthrie *et al.*, 2000: 391). Since the disintegration of the USSR, however, a number of these languages have had the non-Cyrillic script reinstated. Mesthrie *et al.* (2000: 391) cited the case of Moldavia: in August 1990, the Moldavians held a 'Language Festival,' celebrating the reintroduction of the Latin script. A developing adaptation process is also evident in Mandarin Chinese (Chinese) and Japanese, which are adapting to changing functions by *adding* a Roman orthography, to facilitate the learning of these languages phonetically (Crystal, 1995: 313; Sugito, 1989: 117).

Standardization and Harmonization Standardization and harmonization apply in different ways to the same phenomenon: one language, which has many distinctive varieties in the same area. In some cases, like that of Irish (O'Baoill, 1988: 111) or Swahili (Massamba, 1989: 61), the varieties are widely recognized by academics and speakers as being varieties of one language. In order for the language to be adapted to a function, it needs to be stabilized and codified, and therefore standardized, and an orthographical/terminological/grammatical form is chosen from one of the dialects and held up as the norm. Otherwise, one dialect will be chosen as the standard and all its forms held up as the norm by society as well as language planners (Cooper, 1989: 134).

Harmonization is a form of standardization, but operates across varieties that are regarded as closely related, but distinct, languages. In essence, harmonization is an attempt to build one standard language from a variety of closely related languages (and all of their respective varieties). The harmonization (also 'unification') question in South Africa was revisited in 1989 by Neville Alexander (1989: 64), who proposed the harmonization of the seven major indigenous languages into two standards:

1. Standard Nguni, comprising Xhosa, Zulu, Ndebele, and Swati;
2. Standard Sotho, comprising Southern Sotho, Northern Sotho (Pedi), and Tswana.

Table 3 Equivalent terms in Xhosa, English, and Zulu

Xhosa	*Zulu*	*English*
ifoni	*ithelefoni*	telephone
imoto	*imoto*	motor car
umbane	*ugesi*	electricity
ilayibri	*ilabhulali*	library
ikompiyuta	*ikomputha*	computer

Source: Adapted from Reader's Digest (1985) *South African multi-language dictionary*, with permission.

Harmonizing the indigenous languages of South Africa would eliminate the need to adapt and modernize every one of the seven languages that make up Sotho and Nguni. The harmonization of these languages could begin with new terminology, which can be coined as illustrated above. Table 3 illustrates similarities and differences between the Nguni languages.

The similarity between these two languages is striking and shows the close relation of the languages to each other. Differences in vocabulary and pronunciation appear minor, but are significant to their speech communities, which may be concerned that linguistic assimilation means political assimilation (Msimang, 1998: 167). Those involved in language harmonization will have to liase extensively across languages to avoid being perceived to value one variety or language group above another.

Conclusion

Language adaptation and modernization are essential to the evolution and, indeed, survival of any language. The linguistic change brought about through adaptation reflects the dynamics of the society in which it is used. The fact that intervention is sometimes necessary links the field with that of language maintenance: the adaptation of a language to fulfill modern functions is surely a mechanism for language maintenance. It ensures that a language remains valued by its own community and others.

Language and Dialect: Linguistic Varieties

P Trudgill, Universite de Fribourg, Fribourg, Switzerland

Max Weinreich's (unpublished) dictum that "a language is a dialect with an army and a navy" contains much truth, but it is a partial truth. Heinz Kloss (1967) agrees that the notion of 'a language' is as much a political, cultural, and historical notion as it is a purely linguistic notion, but he also points out that languages are of two main sociolinguistic types. These types are called in German *Abstandsprachen* and *Ausbausprachen*. Abstand languages can be called in English 'languages by distance.' They are linguistic varieties that are regarded as separate language by reason of their linguistic distance from all other languages. Basque is an isolate with no known relatives and is extremely distant in terms of its linguistic structures from all other languages, including its geographical neighbors. The status of Basque as a language is thus assured on purely linguistic grounds.

Ausbau languages are in English called 'languages by extention, or construction.' They are linguistic varieties that are regarded as distinct languages for political, cultural, social, and historical as well as linguistic reasons. Ausbau languages depend on cultural factors for their status because they are associated with geographical dialect continua. Polish, Slovak, and Czech are Ausbau languages which together form the West Slavic dialect continuum. They are mutually intelligible, especially Polish and Slovak, and Slovak and Czech, but they form three separate languages because there are three separate standardized norms with their own agreed-upon and accepted orthographies, shared histories, traditional literatures, widely used dictionaries, and grammar books – and their own nation states. Einar Haugen (1966) argues that because of these separate orthographies, literatures, and histories, each of these three standard varieties has the characteristic of *autonomy* – they are independent varieties with, as it were, an existence of their own.

This provides a definition of an Ausbau language as: an autonomous standardized variety together with all the nonstandard dialects from that part of the dialect continuum that are heteronomous with respect to it, i.e., dependent on it. With the term *heteronomy*, or 'dependence,' Haugen refers to facts such as that a Slovak and a Pole from opposite sides of the national frontier may be able to converse with one another readily, but one will go home and read Slovak newspapers in Slovak, while the other will go home and watch Polish television.

Autonomy and heteronomy are cultural and political phenomena, which entails that Ausbau languages are cultural and political constructs. Ausbau languages are therefore potentially temporary entities. They may become dialects, through loss of autonomy, as in the case of Scots, which was formerly a distinct language but is now widely though not universally regarded as a dialect of English. And dialects can become languages, by gaining autonomy, such as when Norwegian lost its heteronomy with respect to Danish, and Macedonian its heteronomy with respect to Bulgarian and Serbian.

Language as an Object of Study

V Žegarac, University of Luton, Luton, UK

> Words are the leaves of the tree of language, of which, if some fall away, a new succession takes their place.
> – Field Marshall John French

What are the properties of language that make it similar to a tree? Could language exist without words in the way a tree may exist without leaves? Could words exist without the tree of language? One way to address these and other similar questions might be to make a list of the main properties of trees. The next step might be to look systematically for identical or similar properties in human languages. This would mean that our knowledge of botany would be guiding our scientific investigation of language. As fundamental differences between trees and languages are many and easily observable, it is evident that this research program does not hold enough promise to be worth pursuing. However, this general approach illustrates an important point about the methodology of scientific research in general and linguistic investigation of language in particular: research into one poorly understood object of study proceeds on the assumption that it shares its essential properties with some other (type of) object which is already better understood. In fact, some major landmarks in the development of modern linguistics are based on four conceptions of language as an object of study: language as a social fact, language as behavior, language as a mental organ, and language as an abstract object.

Language as a Social Fact

The view of language as a social fact, as suggested by Ferdinand de Saussure (1916), marked a shift away from the predominantly historical interest in language toward the study of language as a system at the current stage of its development. Saussure believed that important insights into language could be gained if it was investigated from the point of view of its users, who typically do not know anything about its historical development. Since language use reflects the structure of language as a system of units at a particular stage of its development, language should be studied from the synchronic, rather than the diachronic, perspective. Saussure compared a given stage in the development of a language with the configuration of pieces on the chess board at a given stage of a game of chess. Just as the value of each piece is determined by its position relative to all the other pieces on the board (at a given stage of the game), a particular language at a given stage of development is a system of language units, or language signs (Saussure's term is *signe linguistique*), whose values are determined by their position in relation to all the other signs in the language system at that particular stage. And just as any change in the position of a given chess piece alters the values of all the other pieces and affects the system as a whole, the change that directly affects one language sign (potentially) affects the language system as a whole. For example, although the Serbian word 'jeftin' has the same meaning as the English word 'cheap,' it does not have the same value in the language system, because, in English, 'cheap' contrasts with 'inexpensive,' whereas in Serbian the same contrast is not lexicalized, so that it is either ignored, with 'jeftin' covering both meanings, or it is conveyed in some more elaborate way. The value of the Serbian word 'jeftin,' – its position in the language system – would change significantly if the equivalent of the English 'inexpensive' were to become lexicalized in Serbian.

In Saussure's view, language is a social fact akin to other social institutions, such as the legal system or the dress code. Although people's use of language reflects its systematic character, the structure of language as a system is not directly observable or consciously represented by its users. Saussure posited a distinction between observable linguistic behavior, what he called *parole* (speaking), and the underlying language system, what he called *langue* (language). In his view, the main task of linguistics was to discover *langue* – the language system – by investigating *parole* – language in use. Saussure's view of languages as a social fact is consistent with Émile Durkheim's sociological theory (popular at the time when Saussure was developing his ideas on language), in which social facts are characterized as representations in the 'collective mind,' rather than as material or psychological entities.

Saussure's concept of *langue* as a social fact, and as the proper object of linguistic investigation, had an unfortunate consequence. If *langue* is a system of relations between language signs, which are both external to its users and not directly observable in the manifestations of *langue* in use (because they are part of the 'collective mind'), there is no place for the category of sentence in linguistic analysis. In other words, it follows from Saussure's position that sentences are an aspect of *parole* rather than *langue*. Therefore, they are not a part of the systematic character of a language. So, although we readily produce and comprehend utterances of sentences that we have never produced or heard before and, although

we assign them meanings in a systematic way, Saussure's view of language as a social fact did not adequately accommodate this important aspect of language.

Language as Behavior

The view of language as behavior emerged in American descriptivist linguistics under the influence of positivism (in philosophy) and behaviorism (in psychology). An important methodological stance of logical positivism is that scientific research must be based either on statements that are tautologically true, such as: either P or not P, or they must be based on direct observation. The immediate consequence of this view for the scientific study of language was that all analyses and generalizations should be based strictly on the description of observable linguistic behavior. The main methodological stance of behaviorist psychology was that scientific theories could be refuted only by observable phenomena. Hence the descriptivists' view that insights into language should be firmly grounded in observable data – the products of linguistic behavior – and that they should not be informed by the researcher's introspection or the native speaker's intuition. This meant that more attention was paid to particular languages than to the universal properties of human language, as we can only have direct data from particular languages. However, although descriptivist linguists initially thought of human languages as infinitely diverse, by the 1950s their interest had shifted towards the possibility of devising a discovery procedure, a mechanism that would take a corpus of utterances as input and yield a grammar as output (Harris, 1951).

The most important theoretical tenet of behaviorism was that all human behavior could be explained in terms of stimuli and responses to stimuli without reference to mental structures and processes. This stance had two major implications for the study of language: first, language was characterized as "the totality of utterances that can be made in a speech community" (Bloomfield, 1928). Second, since meaning is not directly observable and it could not be studied without reference to intuitive, introspective judgments, it was considered not to be the proper object of linguistics. Though to a lesser extent than Saussure's conception of language as a social fact, the view of language as the product of behavior (especially in the early stages) also tended to focus on the phonological and morphological analysis of language, rather than on the less directly observable structural relations between words within sentences.

Language as a Mental Organ

The view of language as a mental organ is central to the most influential modern linguistic theory, the generative approach to language, developed by Noam Chomsky since the 1950s and his many followers (see Chomsky, 1986, 1988, 2000). Although the system of ideas that characterizes present-day generative linguistics is very complex, the basic assumptions on the nature of language are clearly established and they appear to be fundamentally commonsensical.

The idea that language is a mental organ is best illustrated by an analogy with other biologically specified properties of human beings. The development of any organism is partly determined by its genetic makeup and partly by environmental factors. For example, the onset of puberty and the height of a person are genetically determined, but they are also affected to some limited extent by external factors, such as nutrition. Given the diversity of environmental circumstances in which people grow up, and the uniformity in their physical appearance, there can be hardly any doubt as to the primacy of genetic makeup over the environment. The same observation carries over to our mental capacities. For example, numerical ability is unique to humans, who develop it in a uniform way regardless of the differences in their sociocultural and physical environments. Similarly, the design features of language, such as recursion, arbitrariness, and duality of patterning, cannot be explained as the result of environmental factors. Therefore, we should assume that both our ability to count and our linguistic ability are genetically specified. In other words, just as arms and legs are physical organs, language is a mental organ. The interaction with the environment triggers the development of language, but the environmental inputs are simply not sufficiently structured for it to be plausible to assume that language development involves the construction of more and more detailed mirror images of the external world. Other comparable capacities would include our musical ability and the ability to construct scientific theories.

If language is a mental organ, then linguistics should be seen as a discipline of psychology, ultimately biology. It should aim to discover the abstract properties of language that make it possible to answer the following questions:

1. What do we know when we know language?
2. How is knowledge of language acquired?
3. How is this knowledge of language put to use?

In this view, the knowledge of language is characterized as a (generative) grammar: a finite system of interacting rules and principles that specify (more

technically, generate) an infinite number of expressions, each of which is a structural configuration (e.g., of words into phrases and sentences) associated with a phonetic form and meaning. At the core of our ability to acquire language lie some universal innate properties of grammar, which guide the child's language development. The innate properties of grammar constrain the range of possible grammars of language and enable the child to find out which of the possible grammars is best evidenced by the linguistic behavior of those around him. This genetic endowment enables the child to go beyond the evidence presented by the data in determining the grammar. For instance, a child acquiring English figures out that 'John is too stubborn to talk to' means, roughly, 'John is so stubborn that nobody can talk to him' without explicit instruction and without being distracted by the possible analogy with utterances like 'John is too stubborn to talk to Bill,' which would be misleading. Therefore, evidence from language acquisition supports the view that the child constructs the grammar on the basis of innate mental structures that heavily constrain the range of available choices at any given stage of his linguistic development. The question of how knowledge of language is put to use is investigated by designing 'performance models' based on the mental grammar.

The research program of Chomskyan generative grammar differs in two important respects from those associated with the view of language as a social fact and the view of language as behavior. First, there is a shift of emphasis from the study of individual languages to the study of Universal Grammar (UG), where the latter is another name for language as a mental organ (in terms of the properties it identifies as the set of grammars that a human being can learn under the conditions in which language acquisition normally takes place). Second, language as an object of study is an element of the mind, which Chomsky calls Internalized language (I-language). The approaches that consider language to be a social fact or behavior and the products of behavior are concerned with the study of language as external to the minds of its speakers. In Chomsky's terms, they are concerned with the study of Externalized language (E-language). Chomsky argues that E-languages (which correspond closely to what people normally mean when they speak about English, French, German, Chinese, Swahili, etc.) are epiphenomenal. In other words, they are complex constructs resulting from the interaction of various sociopolitical and historical factors. Therefore, understood in this way, a particular language like English or French is not a proper object of scientific investigation. Although people ordinarily speak about particular languages as individual objects that exist independently of individual speakers (in utterances like 'French is the language of diplomacy.'), Chomsky insists that this shift of focus from E-language to I-language is a shift towards the commonsense view of language, because when we say that a person knows a language we usually mean that they know how to relate sound patterns with meanings in a particular systematic way.

Language as an Abstract Object

In contrast to Chomsky's mentalist conception of language, Katz (1981) presents a detailed argument to support the view of language as an abstract object. The distinctive characteristics of abstract objects are (a) that their existence is independent of the existence of the mind, and (b) that they do not occupy a position in space and time. Presumably, natural numbers, which underlie the laws of nature, would exist even if human or other intelligence did not, and they are not located at particular places and times. In the light of these observations a natural language, such as English or Japanese, might seem a poor candidate for the category of abstract object. However, Katz (1981) argues that the task of writing the grammar of a language is too stringently constrained on Chomsky's requirement "that a grammar represent a language only in the particular form that knowledge of the language takes when such knowledge is realized in the human mind or brain" (Katz, 1981: 92). Arguably, this requirement has some unwelcome implications for linguistic analysis. For example, let us say that two grammars of a given language (G1 and G2) have been written. G1 reflects the speaker-hearer's knowledge better than G2, but G2 is simpler and more elegant than G1. G1 and G2 are equivalent in all other respects. The question is: 'Is G1 to be preferred to G2, or is G2 to be preferred to G1?' In Katz's view it would be a mistake to reject G2 just because it is less psychologically plausible than G1. He points out the importance of the distinction between the knowledge of something and the object of knowledge itself. For example, natural numbers are distinct from the different ways in which they are represented in various calculators. By the same token, the speaker's knowledge of language is distinct from language itself. Chomsky (1986: 49) rejects this view with the following analogy between language and the heart as biological organs: the heart may be simply and elegantly described as a pump, disregarding what actually makes it beat as a part of the organism, but it does not follow that such a description would be superior to one which looks at the actual anatomy and physiology of the human heart.

Therefore, if G2 is simpler and more elegant than G1, but G1 is more plausible as a psychologically real description of the speaker-hearer's knowledge of their language, then it is obvious that G2 should not be preferred to G1.

Katz also challenges Chomsky's view that individual languages are not proper objects of scientific study because they are sociopolitical constructs. In his view, this is "like claiming that the concept of number is not an object of mathematics but a sociopolitical one." (1981: 79–80). Chomsky (1986: 47) rejects this objection out of hand by describing it as a "curious conclusion" (for other criticisms and a defense against them, see Katz, 1985). Although some criticisms of Katz's view of language seem very convincing, a reasonably strong case can be made in support of the conception of language as an abstract object. On the one hand, the idea that language can be seen and studied scientifically as an abstract object does not entail that it is not also a psychological object. Hence, it is far from obvious that the only interesting and useful scientific approach to the study of language is psychological (biological). In other words, the conceptions of language as a mental organ and language as an abstract object might both provide the basis for credible scientific research. Moreover, the scientific study of various physical organs, such as the human heart, can easily draw on readily available evidence of their structure. By comparison, the evidence for the analysis and description of language as a mental organ is rather scant. Thus, if an organ, e.g., the human heart, were not available for relatively direct observation, then it would be perfectly sensible to investigate it by trying to figure out the best abstract model in the hope that it would also turn out to be the one that corresponds most closely to the real thing. In fact, much work within Chomsky's generative approach in linguistics seems to proceed in this way. On the other hand, Katz (1985: 199–200) argues that theories of language grounded in individual psychology are not abstract enough to provide plausible explanations of language structure. His discussion of analytic sentences is particularly convincing. Analytic sentences, such as 'Nightmares are dreams.' and 'Flawed gems are imperfect.' are necessarily true in virtue of the semantic level of grammars. The Chomskyan approach, which characterizes the grammar in psychological terms, cannot provide an adequate account of necessary truths. 'Nightmares are dreams.' and 'Flawed gems are imperfect.' are true sentences, regardless of our psychological (biological) makeup, but, in the Chomskyan approach, these sentences have to be analyzed as necessarily true, because humans are psychologically (biologically) designed so that we cannot think of them as anything other than true statements. While this and related issues remain open for debate, there can be no doubt that Chomsky's psychological approach to language remains the most influential perspective from which it is studied within linguistics.

Language Attitudes

J Edwards, St Francis Xavier University, Antigonish, NS, Canada

> One grievous failing of Elizabeth's was her occasional pretty and picturesque use of dialect words – those terrible marks of the beast to the truly genteel.
> Thomas Hardy (*The mayor of Casterbridge*, 1886)

> It is impossible for an Englishman to open his mouth without making some other Englishman hate or despise him.
> George Bernard Shaw (*Pygmalion*, 1912)

> The operative class, whose massacre of their mother tongue, however inhuman, could excite no astonishment.
> Thomas Hamilton (*Men and manners in America*, 1833)

Introduction

The most basic theme in modern social psychology is the importance of perception. We do not react to the world on the basis of sensory input but, rather, in terms of what we perceive that input to mean. This is the foundation of all our social constructions, of all our individual and group relationships, and it is a foundation that reflects – in ongoing fashion – our accumulated social knowledge. Perception is the filter through which sensory data are strained, and the establishment and maintenance of this filter is culturally specific and – within social groupings – individualized to a greater or lesser extent. For example, because every individual has accumulated a unique set of experiences, each set of perceptual spectacles is itself special to some extent. At the same time, there are many social perceptions that group members hold in common: at one level, we can think of these as stereotypes, at another as culture itself. At a group level, the most important feature has to do with the acceptance of shared understanding. In a great many instances, this is the only sort of understanding to which we have access, and we sometimes fall prey to the idea that **our** understanding is, in fact, the only sort possible. Nonetheless, we are aware (occasionally, at least) of the relative nature of social knowledge when we realize that others do not sort out their world in quite the same way as we do.

Perceptions operate in societies, most of which are stratified in various ways and in which – to put things bluntly – power and status are often able to translate social difference into social deficiency. Because language is one of the traditionally important social markers, it is not surprising that the study of attitudes has a central position in the social psychology of language. Nor is it surprising that the results of this study shed some light on the generalities just mentioned. It is easy, for example, to demonstrate that great variation exists in terms of people's reactions to (or evaluations of) different accents and dialects. The question, of course, is what to make of this variation.

The Basis of Judgment

Social preferences and prejudices concerning language varieties are long-standing and of continuing potency. This is because views of language correspond to views of the social status of language users; in this sense, language (or dialect or accent) provides simple labels which evoke social stereotypes that go far beyond language itself.

We can begin here by observing that even dictionary definitions of dialect and accent help to sustain the view that nonstandard language is less correct language. The *Oxford English Dictionary* (*OED*), for example, notes that dialect may be considered as "one of the subordinate forms or varieties of a language arising from local peculiarities of vocabulary, pronunciation, and idiom." This definition is implicitly held by those for whom the term 'dialect' conjures up an image of some rustic, regional speech pattern; for such people, the 'standard' variety (see below) is not really a dialect at all; rather, they consider it as the 'correct' form from which all others diverge. On accent, the *OED* is not much better; it is, we find, a mode of utterance which 'consists mainly in a prevailing quality of tone, or in a peculiar alteration of pitch, but may include mispronunciation of vowels or consonants, misplacing of stress, and misinflection of a sentence.'

But what is the basis for language attitudes and judgments? Three broad possibilities suggest themselves.

Intrinsic Difference

One possibility is that language attitudes reflect intrinsic differences across and within language varieties themselves. That is, the reason for variety A being evaluated so much more favorably than variety B is simply that A is a linguistically superior form. Although this is a view that has had considerable historical support, and while it remains common at a popular level in virtually all linguistically stratified societies, linguists have convincingly demonstrated that to see languages or dialects in terms of innate superiority or inferiority is to profoundly misunderstand the nature of human language itself:

> just as there is no linguistic reason for arguing that Gaelic is superior to Chinese, so no English dialect can be claimed to be linguistically superior or inferior to any other . . . There is no linguistic evidence whatsoever for suggesting that one dialect is more 'expressive' or 'logical' than any other, or for postulating that there are any 'primitive', 'inadequate' or 'debased' English dialects. (Trudgill, 1975: 26)

A very good demonstration of this was provided by William Labov (Labov, 1976). He studied Black English (in the United States), which makes an excellent test case for dialect validity since it had for so long been rejected by the white middle class, and since its speakers were victims of a prejudice that went well beyond language alone. If it could be shown that Black English was not some debased variety, this would go some way towards establishing linguistic integrity for all dialect varieties.

There were three strands to Labov's work. First, he justly criticized earlier studies which had elicited Black English from youngsters through interview techniques which were both unfamiliar and intimidating; these were hardly likely, he noted, to produce normal, conversational samples. Second, Labov reminded us of what casual observers had known for a very long time – the Black community is verbally rich and, like other 'oral' cultures worldwide, supports and rewards those who are particularly linguistically gifted. Third, and most important of all, Labov demonstrated the regular, rule-governed nature of Black English. Rules are of course an essential feature of language, and if it were possible to demonstrate formal grammatical regulation within Black English – not necessarily identical, of course, to regulation in other dialects – then charges of inaccuracy and sloppiness would become groundless, and it could not be dismissed as some 'approximation' to 'proper' English.

As an example, here is one of the rules Labov described for Black English, a practice called 'copula deletion.' In a sentence such as *she the first one started us off*, the *is* is not present. Does this mean that the Black speaker who uttered it is unaware of this verb form? Well, consider another sentence taken from a Black corpus: *I was small then* – here, the past tense of the verb 'to be' appears. Why should it figure in this sentence but not in the former one? Labov's work revealed the regularity governing this linguistic behavior: in contexts in which the standard variety permits verbal contraction (e.g., *they are going* can become *they're going*), Black English allows deletion (e.g., *they are going* can become *they going*). We have, therefore, a rule – slightly different from the one obtaining in the standard, but no less logical. The regularity is further evidenced by the fact that, in contexts in which the standard does not allow contraction, there is no Black English deletion: *he's as nice as he say he's* is patently incorrect according to the rules of the standard variety, which outlaws contraction in the final position. In like fashion, it is incorrect to say *he's as nice as he says he* in Black English.

The import of this sort of work is clear: there are no substandard language varieties. There are standard dialects in many languages, and so it logically follows that all others must be nonstandard – but this latter term is not pejorative in any technical linguistic sense. A standard dialect is, roughly, that spoken by educated people, and it is the form usually found in writing. Its position derives from history and from the social standing of its speakers. If York instead of London had become the center of English power, for instance, then the traditional BBC newsreader would sound quite different, and schoolteachers would be promoting another form of 'correct' English in the classroom.

Aesthetic Difference

Another possibility might be that language varieties – although not to be seen (grammatically or 'logically') in terms of 'better' or 'worse' – do actually vary in their aesthetic qualities. Perhaps, then, more favorable attitudes might attach to those varieties that sound better, or more mellifluous, or more musical. Many years ago, for instance, standard English was defended as 'one of the most subtle and most beautiful of all expressions of the human spirit' (Chapman, 1932: 562) and, a little later, Henry Wyld, a linguist at the University of Liverpool, wrote:

> If it were possible to compare systematically every vowel sound in RS [Received Standard English – i.e., what we now more usually call RP, Received Pronunciation] with the corresponding sound in a number of provincial and other dialects, assuming that the comparison could be made, as is only fair, between speakers who possessed equal qualities of voice, and the knowledge how to use it, I believe no unbiased listener would hesitate in preferring RS as the most pleasing and sonorous form, and the best suited to be the medium of poetry and oratory. (Wyld, 1934: 610)

I need hardly say that such sentiments were (and are still, of course) not restricted to those speaking in and for English. Can we put to the test, however, the belief that dialect A is more aesthetically pleasing than dialect B?

Recent studies have compared an 'inherent value' hypothesis here with an 'imposed norm' one. The former term suggests, as Wyld did, that aesthetic qualities are intrinsic, while the latter holds that

they are attached or imposed by the listener, who, in hearing a standard (for instance), considers it mellifluous because of the status of its speakers. In one investigation, Welsh adults listened to European French, educated Canadian French and working-class Canadian French voices. Asked to rate the pleasantness and prestige of the voices, the judges – who were virtually ignorant of French – did not single out any of the three varieties. Earlier studies had shown, however, a clear aesthetic preference among French speakers for European French. In another experiment, British undergraduates who knew no Greek evaluated the aesthetic quality of two Greek dialects, the Athenian and the Cretan: the former is the prestige standard form, while the latter is a nonstandard variant of generally low status. As in the French study, no significant differences between the two dialects were found. If anything, there was a slight tendency for these British students to rate the Cretan variety as more pleasant and prestigious than the Athenian (Giles *et al.*, 1974, 1979).

The important element in these demonstrations is that the judges were unaware of the social connotations possessed by the different varieties in their own speech communities. The implication is that, if one removes (experimentally) the social stereotypes usually associated with given varieties, aesthetic judgments will not be made which favor the high-status standards. Anyone who watches a film or a play in which (for example) a woman dressed as a duchess speaks with a Cockney accent can appreciate the point here: someone in the audience who had an understanding of English, but not of more subtle intralinguistic variation and convention, would miss a great deal of the comedic effect. The norms here are imposed by those in the know, and the stereotypes which link beauty, or harshness, or comedy to a particular set of sounds are unavailable to others. (None of this, I hasten to add, rules out purely individual preferences: I may think Italian is the most beautiful language, you may believe that Gaelic is unrivalled – but we can agree to differ on a matter of subjectivity.)

Social Perception

We now turn to a third possibility, which – because we have eliminated the first two – becomes the most likely: the variant evaluations found in the social laboratory and on the street reflect perceptions of the **speakers** of given varieties; any qualities – 'logical' or aesthetic – of the varieties themselves are, at best, of very secondary importance. Thus, listening to a given variety acts as a trigger or a stimulus that evokes attitudes (or prejudices, or stereotypes) about the community to which the speaker is thought to belong.

A general moral here seems to be this: when social stratification is associated with linguistic variation, the variety used by those with social clout will commonly be perceived as (grammatically, lexically, or phonologically) superior to nonstandard forms. There are two exceptions to this rule, and they occur at opposite ends of the status continuum. First, extremely high-status varieties may seem affected and generally over the top. Second, there is a 'covert prestige' possessed by working-class speech, with its positive associations of masculinity. Research has found that both working-class and middle-class males claimed to use nonstandard forms even when they did not customarily do so (Edwards, 1989; Trudgill, 1983). The actual use of such forms, by generally standard-speaking individuals, is most likely when the speaker wants to appear forceful, direct, and unambiguous. An example: a friend of mine, a middle-aged, upper-middle-class American university professor (male), was being pressed by colleagues (also male) on a departmental matter. Finally, he ended a rambling and inconclusive discussion – one that had unfolded according to the norms of standard, educated American English – by smiling broadly and saying, "Listen, boys, you **know** the' ain't no way I can do it." All-male social gatherings, as at least half the readers will know, often produce such examples.

Variation in Social Attitudes

If we reject linguistic and aesthetic arguments as the real underpinnings of variations in language (and speaker) evaluation, we have only cleared away some annoying underbrush. It is very useful to know that the basis for language evaluation rests upon social convention, but we must make more detailed inquiries about the assessment of language varieties. We come then, to language attitudes *per se*.

While many regional or class dialects are perceived unfavorably, there is more than a simple dichotomy between good (standard) and bad (nonstandard). Urban speech patterns (such as, in Britain, those of Birmingham, Glasgow, and Liverpool) are generally seen as more unpleasant than are rural varieties (Devon English, for instance). Again, the basic explanation rests upon social connotation: for many, rural areas have a charm that is absent in heavily urbanized, industrialized centers. So rural dialects, although not as prestigious as the standard, may be viewed more favorably than urban varieties (which are often tied more closely to class differences, as well) (Wilkinson, 1965; Trudgill, 1975).

Wyld (above) hinted at an important problem in the comparison of language varieties. If I wish to find out which of two dialects is the more pleasant (for example), and if I therefore record a speaker of each and have the voices judged by listeners, to what can I reasonably attribute any differential ratings that may be found? Are they due to features of the dialects themselves? Might they not also be reactions to purely individual qualities of voice – tone, pitch, rhythm, pace, and so on? A way around this difficulty was devised in the 1960s by Wallace Lambert. In his 'matched guise' method, judges evaluate a tape-recorded speaker's personality after hearing him or her read the same passage in each of two or more languages, dialects, or accents. The fact that the speaker is, for all 'guises,' the same person is not revealed to the judges (who typically do not guess this). Any variations in the judges' ratings can then be considered as reflections of their stereotyped reactions to the different language varieties, since potentially confounding individual variables are of course constant across guises (see Lambert *et al.*, 1960; Edwards, 1989).

A large number of studies have shown that evaluations of different varieties vary in nonrandom ways. Thus, standard accents and dialects usually connote high status and competence; regional, 'ethnic,' and lower-class varieties are typically associated with greater speaker integrity and attractiveness. Ellen Bouchard Ryan and her colleagues (Ryan *et al.*, 1982, 1984) have attempted to summarize the many language attitude studies by providing an "organizational framework." They suggest that there are two determinants of language perceptions: standardization and vitality. The important point about the standard here is that it is a variety whose norms have been codified and have become associated with social dominance. Vitality refers to the number and importance of functions served, and is clearly bolstered by the status which standards possess; it can also be a feature, however, of nonstandard varieties, given sufficient numbers of speakers and community support. Furthermore, two particularly salient evaluational categories account for most of the variance: social status (which is more or less equivalent to competence) and solidarity (roughly combining integrity and attractiveness) (see Edwards, 1992).

These findings are interesting for several reasons, but the single most important factor is their stereotypical nature: people are evaluated in terms of characteristics that, in a broad-brush sort of way, reflect perceptions of the group to which they are seen to belong. The implication is obvious: **individuals** – with all their personal strengths and weaknesses – are viewed in stereotypical **group** terms. Studies have suggested that at school, in the workplace, in counselor–client relations, and so on, negative stereotypes can create problems. (It is also worth remembering here that stereotyping can operate in the opposite direction, too – those with the socially 'right' attributes may have their progress unfairly expedited.)

Difference, Deficit . . . and Solidarity

In the Classroom

More than three decades ago, John Gumperz and Eduardo Hernández-Chavez made the following observation: "Regardless of overtly expressed attitudes . . . teachers are quite likely to be influenced by what they perceive as deviant speech . . . thus potentially inhibiting the students' desire to learn" (Gumperz and Hernández-Chavez, 1972: 105). Obviously, like other members of society, teachers have language attitudes, and it is not surprising to find that, on the whole, they have downgraded nonstandard varieties and, by extension, the capabilities of their speakers. Trudgill (1975: 63) noted, for example, that teachers were not averse to telling (some of) their pupils that their speech was "wrong . . . bad . . . careless . . . sloppy . . . slovenly . . . vulgar . . . gibberish." A study conducted in Nova Scotia (Edwards and McKinnon, 1987: 335) found similar teacher attitudes: one said that poor children were unable to "articulate their thoughts"; another observed that "Blacks have a slang language all their own – they will not use proper English when the opportunity arises."

Teachers' points of view are, in one sense, merely a particular illustration of a much broader relationship between linguistic variation and social attitudes. But in another sense, their beliefs are special – for the obvious reason that negative evaluations of children's speech styles may lead to real problems, in the classroom and beyond it. It is a cruel irony that socially disadvantaged children, who clearly struggle under all sorts of very real burdens, should be weighed down still more by evaluations of the inadequacies of their language – when these evaluations are typically based upon inaccurate assumptions. The negative reactions to their speech patterns do, however, reveal how hollow a purely academic sense of 'inaccurate assumptions' can be, in a world where attitudes can transform difference into deficit.

'At Home'

Given the strength and pervasiveness of language attitudes, there are strong tendencies for speakers of nonstandard varieties to accept, themselves, the

evaluations of others (the so-called minority group reaction is an example here; see Lambert *et al.*, 1960). While the sense that one's own speech is not very 'good' may be a common phenomenon, it is nonetheless a disturbing one – as the description above of the educational arena makes clear. Thus, Halliday (1968: 165) noted that

> a speaker who is made ashamed of his own language habits suffers a basic injury as a human being; to make anyone . . . feel so ashamed is as indefensible as to make him feel ashamed of the colour of his skin.

Beyond the obvious recommendations for greater linguistic awareness and sensitivity, one might also ask just why low-status speech varieties continue to exist. If they are generally considered inferior, why wouldn't speakers try to eradicate them? Why wouldn't language or dialect shift be a more popular option? Nonstandard speakers are hardly without adequate models for language alteration, after all. Nowadays, more than ever before, the ubiquity of the broadcast media means that virtually all have at least a passive awareness of standard forms (and research has shown how easy it can be for this to be translated into a more active quantity) (Edwards, 1989). Indeed, many years ago it was predicted that a leveling of variant speech styles would be the inevitable consequence of the wired world. But it seems not to have happened.

We have to bear in mind here that the solidarity function of **any** common language is powerful; even a low-prestige variety can act as a bonding agent, reinforcing group identity (see the focused discussion in Ryan, 1979). Group identity and its (linguistic and other) markers are known quantities and, in that sense, 'safe'; on the other hand, attempts to alter speech styles may be risky. Failure may lead to marginalization – a sense of not being a full member of any social group. Even success may prove too costly. A Mexican American who abandoned Spanish was labeled a *vendido* (Carranza and Ryan, 1975), a 'sell-out,' a defector to the other side. A French Canadian in analogous circumstances was a *vendu*. Cockney grandparents once told their grandchildren that, if they tried to speak in a 'la-di-da' accent, their mates would call them 'queer' (Bragg and Ellis, 1976). Whatever the current status of these well-known if somewhat dated cases, it is clear that the principle remains powerful. Finally here, nonstandard speakers may also refrain from attempting to alter their language patterns if the exercise is considered to be pointless – as it may be seen to be for those who are members of visible minority groups, for instance. If reactions to Black English are reflections of social evaluations of Black speakers, then learning and using some more standard form may be a waste of time. The social difficulties faced by Blacks occur largely because they are black, not because they do not use standard English (consider, for example, that there are many nonstandard-speaking Whites in comfortable circumstances).

Language Attitudes and Language Acquisition

One important aspect of attitude study has been its connection with the learning of second (and subsequent) languages. Positive attitudes, it is generally thought, are likely to facilitate second language acquisition, although it is realized that variations in the context and the perceived functions of the new medium are also important. Indeed, this has very much been the received wisdom, and there is a large literature on attitude and motivation in language learning. John Macnamara, however, appeared to take an opposing view, asserting that attitudes were of little importance in language learning (Macnamara, 1973). His argument is worthy of some attention here, since it leads to some finer-grained attention to language attitudes generally (see also Edwards, 1995).

Macnamara noted that necessity may overpower attitude – and this is clearly true. The adoption of English by the Irish, for instance, was a shift not generally accompanied by favorable attitudes; indeed, most historical changes in language use owe much more to socioeconomic and political pressures than they do to attitudes *per se*. But perhaps attitudes of a sort – instrumental attitudes – do play a part in language shift. A mid-19th-century Irishman may have hated English and what it represented, while still acknowledging the necessity and long-term usefulness of the language. A pragmatic or 'instrumental' motivation need not imply the deeper, 'integrative' motives so dear to the hearts of teachers keen on introducing their charges to new languages **and** new cultures. Similarly, there may be a useful distinction here between positive and favorable attitude; to remain with the Irish example, we might say that the attitudes towards the learning of English were positive and instrumental, but not necessarily favorable or integrative. (It must be acknowledged, of course, that instrumental–integrative and positive–favorable distinctions may change or disappear as language shift develops.)

Macnamara went on to contend that pupils' language-learning attitudes at school were also relatively unimportant. Language in the classroom, he said, was typically an unreal and artificial business, with communication subordinated to narrow academic

concerns that fail to engage children's interest. It is this situation, and not pupils' attitudes, that underlies the traditionally poor results of school language programs.

Now, it is undoubtedly true that a great failing in language classrooms has been the absence of realistic usage, but I do not think that this implies that attitudes are of small importance. The argument that the classroom is artificial is essentially a condemnation of approaches and practices, and does not of itself indicate that attitudes are trivial. In fact, attitudes may be of considerable importance precisely because of 'artificiality' – i.e., where a context is **not** perceived as pertinent to real life, or is **not** seen to be necessary, attitudes may make a real difference. The importance of favorable attitudes, then, may vary inversely with real linguistic necessity (Edwards, 2001).

Details and Directions

Within social psychology, 'attitude' is a disposition to react favorably or unfavorably, a disposition with three components: feelings (the affective element), thoughts (the cognitive element), and a resultant tendency to action (the behavioral element). One knows or believes something, has some emotional reaction to it, and then does something about it. Two points, however, should be made.

There is often considerable inconsistency between attitudes and actions. In a classic study, a Chinese couple (accompanied by the experimenter) toured the United States in the early 1930s. Visiting about 250 hotels and restaurants, they were refused service only once; however, when the investigator later wrote to the places visited, he found that more than 90% said they would not serve Chinese people (LaPiere, 1934). There are, of course, many possible reasons for this finding: immediate self-interest, a desire to avoid embarrassment, a difference between reactions to an ethnic group abstraction and assessments in concrete instances, and so on. But the inconsistency remains.

The other point is that there is often confusion between attitude and belief – a confusion particularly noticeable within the language attitude literature. For example, the answer to a questionnaire item such as 'Is a knowledge of French important for your children, yes or no?' reflects a belief. To gauge attitude would require further probing into respondents' feelings about the expressed belief. It would clearly be incorrect to assume that the answer 'yes' implied a favorable attitude: the informant could grudgingly accept that French was important for career success, while loathing both the language and its culture.

More attention to these distinctions – apart from simply improving accuracy – might be salutary in terms of understanding why evaluations take the forms they do. Given that unfavorable reactions to nonstandard varieties have typically been discussed in terms of status or prestige differentials, for instance, it could be useful to confirm this, from the respondents' point of view, by asking them the bases for their evaluations. Such an exercise might be of special interest since – as has been mentioned above – nonstandard varieties elicit positive ratings along some dimensions. It is surely reasonable, after all, to gather as much information as we can from the actual participants in language studies, as well as imposing more purely theoretical interpretations upon their responses (Edwards, 1995).

Language attitude study should perhaps be prepared to expand its scope. Various methodologies have produced a sizable body of evidence bearing on social perceptions, stereotypes, and language attitudes. We can now predict with some confidence what sorts of reactions are likely when people hear varieties of (for instance) Black English, Newfoundland English, Cockney, Received Pronunciation, Boston English, and many others; we can also make predictions about those 'ethnic' varieties produced by nonnative speakers of English that show the influence of the first language. We understand, at a general level, how these reactions come about, via the linguistic 'triggering' already noted, and how they reflect a set of attitudes (or beliefs) – often of stereotypical nature – that listeners have of speakers. Investigators have not, however, gone very much beyond fairly gross explanations; that is, they have typically not related speech evaluations to particular speech attributes. Thus, although hundreds of experiments have revealed negative reactions towards Black English, we have virtually no information relating specific linguistic attributes of that variety to such reactions – attributes that might include pronunciation patterns, particular grammatical constructions, or the use of dialect-specific lexical items (or, of course, any combination of these) (Edwards, 1999).

Some moves have already been made in this direction. For example, in 1982, Howard Giles and Ellen Bouchard Ryan issued a call for "more detailed linguistic and acoustic descriptions of the stimulus voices as well as examining the relative evaluative salience of these particulars for different types of listeners" (Giles and Ryan, 1982: 210). A related, although not so pointed, observation was made by Edwards, in calling for fuller probing of the reasons behind the evaluative decisions made by informants (Edwards, 1982; see also above). In general, though, social psychologists have done little in the way of

isolating linguistic and acoustic variables and relating them to evaluative judgments. Such work has simply not been their métier.

It is in linguistic research that we find descriptions of features that characterize and differentiate language varieties. In recent years, a considerable amount of work has been done here; for example, linguists (including Laver and Trudgill, 1979 – in a book on social markers that remains a valuable reference) have pointed out such phenomena as:

1. the nasality habitually associated with some (RP, for example) but not all varieties of English;
2. the wide dialectal variations in consonant pronunciation: thus, RP speakers pronounce *lock* and *loch* more or less identically, with a final /k/, but (some) Scottish pronunciations involve final /x/. Another example: in British English, pronouncing the postvocalic /r/ in words like *cart* and *mar* is inversely related to social-class status, whereas in some varieties of American English (e.g., New York English) a positive correlation exists between /r/ pronunciation and status;
3. grammatical variation: copula deletion in American Black English, for example (as we have seen, above);
4. lexical differences: some English speakers *brew* their tea, some *mash* it, some let it *steep,* some let it *set,* and so on.

If, however, linguists have been the ones to describe such variation, they have either been relatively uninterested in its relation to variations in social evaluations, or have simply assumed that the more obvious and salient linguistic markers are the triggers for differentiated ratings. Like social psychologists, linguists too have generally stuck to their lasts – although a recent and most welcome collection (Milroy and Preston, 1999) deals explicitly with linkages between linguistic features and attitudes.

Conclusions

There are many important aspects of language attitudes and their ramifications that it has not been possible to attend to in this brief overview. One has to do with the relationship between language and gender. The 'covert prestige' briefly noted above, for instance, is essentially a male phenomenon – the positive connotations of nonstandard speech are not typically found among women; indeed, where middle-class male informants may report more nonstandard usage than is actually the case, female respondents overreport standard dialect usage. A large literature suggests, generally, that women are often more linguistically conservative than are men, that they produce 'politer' and more 'correct' speech, that there are significant gender differences in lexicon and function, and so on. All of these features are influenced by, and reflected in, language attitudes (see Coates, 1993 for a good overview).

Another important area with a burgeoning literature has to do with the accommodations made by speakers in different contexts and with different interlocutors. Linguistic accommodation can take many forms but, whether it operates at or below the level of conscious awareness, its fundamental feature is the modification of speech patterns to converge with, or diverge from, those of others. Accommodation can reflect individual concerns – wanting to sound more like the boss, or intentionally departing from the usage of someone you dislike – or group ones: you may wish to emphasize your 'in-group' membership, or to solidify an ethnic or class boundary. Once again, attitudes clearly underpin practices (for an overview here, see Giles and Coupland, 1991; Robinson and Giles, 2001).

What I have tried to deal with in this article is some of the central themes in the area, some of the scaffoldings on which other aspects rest. They include the following:

1. some basic definitional and terminological matters: it is always important to be clear about terms and meanings, and especially so when – in areas such as this – the terms have broad popular connotations as well as more narrowly academic ones;
2. the bases upon which linguistic judgments are made: most people still believe that intrinsic qualities of language varieties can reasonably underpin rankings of 'better' and 'worse.' The persistence of this belief is disappointing, to say the least, especially in educational circles;
3. the manner in which linguistic difference is typically translated into linguistic deficit: it is evident that, linguistic enlightenment notwithstanding, society continues to deal rather bluntly with variation – and, if most consider a difference to be a deficit, then it becomes one;
4. the ways in which linguistically stigmatized individuals and groups come to accept the judgments made of them by 'outsiders': this is an extension of the previous point, insofar as it is a potent reflection of the power of social pressure;
5. the reasons behind the persistence of low-prestige varieties: given the potency of social pressure and prejudice, it is interesting that group solidarity, on the one hand, and fear of personal marginalization, on the other, are sufficient to maintain stigmatized varieties;

6. the evaluative dimensions and categories that seem to be employed when ranking different language varieties: the regularity with which a few basic categories (such as 'competence,' 'integrity,' and 'reliability') appear across a very wide range of studies is one of the most robust features in language study;
7. language attitudes in contexts of learning and shift: questions of how, and to what extent, attitudes and motivations are important in situations of change – or potential change – throw light upon both the attitudes and the contexts;
8. the need for greater interdisciplinarity in what are sometimes called, hopefully, the 'language sciences': a common criticism of modern social psychology involves its allegedly disembodied character – further and deeper attention to language, and language attitudes, would at once redress academic oversight and inevitably abet interdisciplinary linkages that would, in turn, reduce decontextualization.

Language Change and Cultural Change

J H Hill, University of Arizona, Tucson, AZ, USA

Human languages are inherently variable and dynamic, and their shifting shapes are constrained by diverse factors. Culture, defined as those human projects which endow the raw materials of our world – including the stuff of language – with meaning, must be among these. But to explore relationships between language change and cultural change requires appreciation of the immense complexity of cultural mediation, and linguistic analysis at a high level of detail and delicacy.

Several basic observations are required prior to developing this theme. First, 'languages' do not map isomorphically onto 'cultures.' From this obvious fact it is immediately clear that the relationship between language change and cultural change will not be straightforward. Mutually intelligible varieties of large regional and world languages are found among people involved in very diverse ways of life. Mutually intelligible varieties of Spanish are spoken by peasants in Mexico and philosophers in Madrid. Conversely, people who share very similar ways of life may speak several different languages. The Pueblo Indians of the southwest United States constitute a highly coherent and relatively homogeneous culture area, with a long history of contact and exchange among their communities, but speak at least five mutually unintelligible languages belonging to three different language families, plus one isolate. Local language ideologies work to minimize convergence among these languages (Kroskrity, 1993).

Second, resonances between language change and cultural change tend to be quite local. Linguists correctly greet global generalizations with profound suspicion. For instance, there is no universal correlation between the elaboration of sexism and gender-based discrimination in a society and the grammaticalization of gender in its language or languages. In an exceptionally careful study of this question, Chafe (2002) explored the relationship between gender roles and the grammar of gender in Northern Iroquoian. In several languages of the group, a set of masculine pronominals distinguishes singular and plural forms and subject and object case. A feminine gender pronominal has developed from an original 'nonspecific' pronoun, and in the nonsingular is not distinguished from neuter gender. Chafe argued that contrastive elaboration of masculine gender versus feminine gender pronominals, which occurred about a thousand years ago, is in resonance with the prominence given to males in many Northern Iroquoian cultural scenarios (although Northern Iroquoian societies are matrilineal). However, he noted that such male prominence is extremely common in human communities, yet most languages do not show the same kind of differential elaboration of gender marking. For this reason, he preferred to speak of a cultural 'motivation' for the pattern, rather than of a cultural 'cause.'

In the Northern Iroquoian example, the structure of the pronominal system is unlikely to be prior to, and motivating of, the prominence of male roles. Instead, male prominence motivated the elaboration of the masculine pronouns. The diverse developments of noun classification through plural marking in the Uto-Aztecan languages (Hill and Hill, 1997) provide another case of the cultural motivation of linguistic patterning, in this case a loss of elaboration. In Proto-Uto-Aztecan, reduplicated plurals marked a class of human nouns, as against other nouns pluralized with suffixes. In two descendant language groups, the O'odham or Upper Piman languages and Hopi, the marked class has been extended beyond human nouns to classify for 'protrusion' and 'intrusion.' In Tohono O'odham (a Uto-Aztecan language of Arizona), spoken in a community that observed patrilineal descent, lineage exogamy, and patrilocal residence, the marked plural class includes kinship terms for women and kin linked to ego by women, but not kinship terms for men. This resonates with local understandings, expressed in legends, that inmarrying women stand as marked outsiders to the patrilineal kin group. In contrast, in Hopi, with matrilineal descent and matrilocal residence, the only marked plural kin terms are the words for 'bride, inmarrying woman' (an outsider from the point of view of the husband's matrilineage) and 'husband, inmarrying man' (an outsider from the point of view of the wife's matrilineage). That is, the metaphor of 'outsiderness' functions in the noun classification system in the kin terms of both languages, but is greatly restricted in Hopi, consistent with the understanding there that descent through females constitutes the core social unit, the matrilineage. It seems most unlikely that patterning in the pluralization of kin terms would shape social organization, but quite reasonable that understandings of social organization would motivate the use of marked versus unmarked plural forms.

The loss in English of the distinction, otherwise nearly universal in European languages, between a polite/distant and an intimate/solidary second-person pronoun provides another example of such culturally motivated language change. Most scholars believe that the English T-pronouns, the intimate/solidary

second person forms *thou*, *thee*, *thy*, *thine* were lost in ordinary usage in the late 17th century in reaction to the linguistic practices of a dissident religious sect, the Society of Friends or Quakers. Friends, consistent with their belief in the equality of all human beings before God, refused to use the V-pronouns that signaled social distance and deference. This practice was scandalous in a society where a regard for hierarchy was hegemonic and the use of a T-pronoun could constitute insult or even illegal *lèse majesté* that might lead to imprisonment. Rather than risk being taken for a Quaker, other speakers displayed their commitment to hierarchy and propriety by generalizing the V-pronouns even to contexts that had hitherto called for the use of the T-form without any presupposition of insult or disrespect. Regardless of whether the role of Quaker innovation has been properly understood, it seems likely that cultural ambivalences and ambiguities about hierarchy in the emergence of modernity shaped the gradual loss of the T/V distinction in English, rather than that the loss of the T/V distinction motivated a reorganization of British social order.

Benjamin Whorf, often misunderstood as a linguistic determinist, outlined in his most significant paper (Whorf, 1956) a dialectical interaction between language change and cultural change that attempted to account for examples like those above. Silverstein (1976, 1979, 1996) has proposed a contemporary semiotic refinement of Whorf's ideas. He argues that general semiotic principles underlie the development of such resonances between language change and culture change. These principles produce a 'dialectic of indexicality' which drives analogical change. First, speakers project referential functions on to indexical functions and 'objectify' these. In the case of the English (and other European language) pronouns reviewed above, Silverstein suggests the following chain of analogies. The third-person pronouns exhibit apparent referential distinctions of number and gender, which are taken by speakers to refer properly to things in the world – although these 'things' achieve their 'naturalized' status, of course, precisely through linguistic practice and specifically through indexicality. But speakers come to see this indexical projection as 'reference.' By analogy, the social hierarchy distinctions of the T/V contrast in the second-person pronouns, which are technically indexical, can be taken by speakers to be referential as well. Thus to English speakers the social world came to be seen as consisting of individuals possessing an inherent property of meriting deference, parallel to inherent properties of gender, or of singularity versus plurality. Such analogical reasoning permits speakers to manage social anxieties (Inoue, 2004), by trying to bring usage rigidly into line with an understanding of the world that has precisely been projected from language in the first place. Such 'iconizing' (Gal and Irvine, 1995) projects do not always succeed in taking a language change to completion, but it is clear that the constant interplay of indexical orders (Silverstein, 1996), motivated by specific cultural anxieties and ambivalences that must be ever present in human communities, constitutes a powerful force for language change.

Among the kinds of change that can be driven by the 'dialectic of indexicality' is the formation and spread of styles and registers. An excellent example is the shift in American English in the stylistic features thought to be appropriate to the talk and text of ministers, political orators, and the like in their public roles. Cmiel (1990) has shown that an explicit ideology of egalitarianism emerging through the end of the 18th and the first half of the 19th centuries led to the development of the so-called middling style for elevated language. In the middling style ordinary vernacular words and short sentences came to be favored. This process of reshaping public language as an icon of the American egalitarian imaginary continues to develop. The grammar and lexicon of documents such as the Declaration of Independence and the U.S. Constitution strike many 21st-century Americans as forbiddingly elevated and elite. Even liturgical language has been simplified: new translations of the Christian Bible are in strikingly everyday language, and ministers of the gospel experiment with vernacular forms (as in the famous case of Cornell West, a minister and professor at Harvard University, who recorded a compact disk of raps, a genre that originated in African-American street culture). Highly placed American politicians can use quite vulgar language, even in elevated public contexts, without facing censure – indeed, such language may bring approbation. It marks them not only as ordinary people with a commitment to egalitarianism, but as plain-speaking 'straight shooters.' It is perhaps not surprising that the tendency toward 'plain speech' in public forums has reached new heights (or depths) at precisely a period when increasing political-economic inequality has made many Americans anxious about the status of egalitarianism, a continuing ultimate value in U.S. society.

Language Change and Sociocultural Evolution

The work briefly reviewed above examines very fine-grained linguistic changes motivated by ideological processes in local speech communities. However, linkages between more general tendencies of

language change and cultural change have often been proposed. Widely accepted through the early 20th century was the theory that human language exhibited a hierarchy of evolutionary grades, from 'primitive' to 'civilized,' that correlated with the grades of the theory of cultural evolution. While linguists today almost universally reject such ideas, evolutionary thinking continues to have a place in theories of the relationship between language change and culture change, and deserves brief attention.

Certain limited features of human languages may be loosely correlated with subsistence type and social complexity. These include plant and animal terminologies. For instance, Brown (1984) argued that the number of life-form terms for plants (*tree*, *bush*, *herb*, *grass*, *vine*, etc.) is correlated with increasing social complexity. Brown also suggested that cultivators have many more folk generic terms for plants than do hunter-gatherers, and also use more binomial species labels. While other studies have supported these results (e.g., Balée, 1994), they should be interpreted with caution. Balée has pointed out that the difference in the number of generics for plants between cultivators who speak Ka'apor (Urubú-Kaapor) and hunter-gatherers who speak Guajá, another Tupi-Guaraní language closely related to Ka'apor, is due partly to the fact that the Ka'apor simply have more uses for plants; they use implements made from plants to process other plants, and their sedentism permits an elaborate material culture. Furthermore, Hunn (2001) has pointed out that in Oaxaca, vernacular speakers of Spanish, an expanding world language, have far simpler repertoires of biosystematic terminology than do speakers of small local Zapotecan languages, in spite of the fact that Spanish has been spoken in the area for 500 years. Berlin and Kay (1969) held that elaboration of color terminologies was correlated with level of sociocultural evolution. But MacLaury (1991) showed in a study of Mayan-language speakers in Chiapas that the elaboration of color terminology could exhibit vast differences among speakers of a single language, and seemed to depend more on the specific life circumstances of individuals, especially on how much people were forced to engage with novelty, than on any broad correlation between language and sociocultural evolution. Thus terminological elaboration in the biosystematic and color lexicons appears to be largely correlated with the elaboration of attention and use, a matter that is not surprising in any way and that can be accounted for within Silverstein's model outlined above, without appeal to evolution theory.

The concept of natural selection, taken from Darwinian theory, has been invoked by modern linguists to account for the relationship between language change and cultural change. Hymes (1968) suggested that the current reduction of world linguistic diversity, caused by the expansion of 'world' languages at the expense of 'full' languages, results from a selective process in which world languages are better adapted to certain emerging communicative functions, and thus replace full languages. Croft (2000) and Mufwene (2001) have suggested that linguistic elements within inherently variable assemblages (which Mufwene has characterized as 'Lamarckian species') – phonetic realizations, construction types, semantic features, and the like – can be seen, like genetic alleles, as targets of natural selection. Cultural context, among other variables, yields selective pressures, and the relative frequency of particular realizations of linguistic elements will reflect these. The development of Haitian Creole (Haitian Creole French) from French has been treated within this model. During the early 'settler' period, when slaves lived intimately with their French masters on small landholdings, they acquired a version of vernacular French that, while it was a second language, was not greatly dissimilar from the French spoken by the native speakers from whom they learned it. The shift to plantation agriculture, however, swamped out these early second-language varieties of French. Increasingly large populations of newly imported African slaves had less and less access to French models. Themselves learning the language from other second-language speakers, they favored the least marked French constructions and constructions derived from African sources over the varieties used by the earlier African settlers of Haiti. This process yielded the basilectal creole varieties attested in Haiti today. Thus, the context for selection that favored basilectal structures was a cultural system: plantation agriculture, with its huge slave work forces supervised by relatively few – and interactionally remote or absent – French-speaking overseers.
